15.322.1 Detailed Description

The common interface for an open POSIX file.

This interface is common to all kinds of open files, independent of the file type (e.g., directory, regular file etc.). However, in the [L4Re::Vfs](#) the interface [File](#) is used for every real object.

See also

[L4Re::Vfs::File](#) for more information.

15.328.1 Detailed Description

Class that abstracts framebuffers.

A framebuffer is the pixel data that is displayed on a screen and a [Goos](#) object lets the user manipulate that data. A [Goos](#) makes use of two kinds of objects:

- Buffers in the form of [L4Re::Dataspace](#) objects. These hold the bytes for the pixel data.
- [L4Re::Video::View](#) objects.

Both can either be static, that is their number and configuration is fixed and determined by the framebuffer, or they can be dynamic, with the user allocating them.

15.331.1 Detailed Description

[View](#) of a framebuffer.

A view is a rectangular subset of a framebuffer managed by a [Goos](#) object. The [Goos](#) orders multiple views in a stack which determines which view is on top in case they overlap. The view's pixel data is provided by a backing buffer, which must belong to the [Goos](#). It can be static or dynamically allocated, depending on the framebuffer.

Parameters

out	<i>devinfo</i>	Information structure which contains details about the device. The pointer might be NULL.
-----	----------------	---

Return values

0	Success.
-L4_ENODEV	No device with the given device handle <code>dev</code> could be found.

    Device * child,
    char const * hid,
    int depth = L4VBUS_MAX_DEPTH,
    l4vbus_device_t * devinfo = 0 ) const [inline]
```

Find a device by the hardware interface identifier (HID).

This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.

It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with `child` pointing to the device found in the previous iteration. The iteration starts at `child` that might be any device node in the tree.

Parameters

in, out	<i>child</i>	Handle of the device from where in the device tree the search should start. To start searching from the beginning <i>child</i> must be initialized using the default (L4VBUS_NULL). If a matching device is found, its handle is returned through this parameter.
	<i>hid</i>	HID of the device
	<i>depth</i>	Maximum depth for the recursive lookup
out	<i>devinfo</i>	Device information structure (might be NULL)

Return values

≥ 0	A device with the given HID was found.
<code>-L4_ENOENT</code>	No device with the given HID could be found on the vbus.
<code>-L4_EINVAL</code>	Invalid or no HID provided.
<code>-L4_ENODEV</code>	Function called on a non-existing device.

```
int L4vbus::Device::get_resource (
    int res_idx,
    l4vbus_resource_t * res ) const [inline]
```

Obtain the resource description of an individual device resource.

Parameters

	<i>res_idx</i>	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the l4vbus_device_t structure that is returned by L4vbus::Device::device_by_hid() and L4vbus::Device::next_device() .
out	<i>res</i>	Descriptor of the resource.

This function returns the resource descriptor of an individual device resource selected by the `res_idx` parameter.

Return values

<i>0</i>	Success.
<i>-L4_ENOENT</i>	Invalid resource index <code>res_idx</code> .

```

Find next child following `child`.

Parameters

in, out	<i>child</i>	Handle of the device that precedes the device that shall be returned. To start from the beginning, <i>child</i> must be initialized with L4VBUS_NULL (Device::Device). If a device is found, its handle is returned through this parameter.
	<i>depth</i>	Depth to look for
out	<i>devinfo</i>	Device information (might be NULL)

15.372.1 Detailed Description

IPC interface for virtio over [L4](#) IPC.

The [L4virtio](#) protocol is an adaption of the mmio virtio transport 1.0(4). This interface allows to exchange the necessary resources: device configuration page, notification interrupts and dataspace for payload.

Notification interrupts can be configured independently for changes to the configuration space and each queue through special L4virtio-specific `notify_index` fields in the config page and queue configuration. The interface distinguishes between device-to-driver and driver-to-device notification interrupts.

Device-to-driver interrupts are configured via the ICU interface. The device announces the maximum number of supported interrupts via `lcu::info()`. The driver can then bind interrupts using `lcu::bind()`.

Driver-to-device interrupts must be requested from the device through [device_notification_irq\(\)](#).

Definition at line 39 of file [l4virtio](#).

15.372.2 Member Function Documentation**15.372.2.1 config_queue()**

```
long L4virtio::Device::config_queue (
    unsigned queue )
```

Trigger queue configuration of the given queue.

Usually all queues are configured when the status is written to running. However, in some cases queues shall be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

Parameters

<i>queue</i>	Queue index for the queue to be configured.
--------------	---

Return values

0	on success.
-L4_EIO	The queue's status is invalid.
-L4_ERANGE	The queue index exceeds the number of queues.
-L4_EINVAL	Otherwise.

Referenced by [L4virtio::Driver::Device::config_queue\(\)](#).

long L4virtio::Device::device_config (
    L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > config_ds,
    l4_addr_t * ds_offset )

```

Get the dataspace with the [L4virtio](#) configuration page.

Parameters

<i>config_ds</i>	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
<i>ds_offset</i>	Offset into the dataspace where the device configuration structure starts.

Referenced by [L4virtio::Driver::Device::driver_connect\(\)](#).

Here is the caller graph for this function:

15.372.2.3 device_notification_irq()

```
long L4virtio::Device::device_notification_irq (
    unsigned index,
    L4::Ipc::Out< L4::Cap< L4::Triggerable > > irq )
```

Get the notification interrupt corresponding to the given index.

Parameters

	<i>index</i>	Index of the interrupt.
out	<i>irq</i>	Triggerable for the given index.

Return values

<i>L4_EOK</i>	Success.
<i>L4_ENOSYS</i>	IRQ notification not supported by device.
<i><0</i>	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.

Interrupts must always be rerequested after a device reset.

15.372.2.4 register_ds()

    l4_uint64_t base,
    l4_umword_t offset,
    l4_umword_t size )
```

Register a shared data space with VIRTIO host.

Parameters

<i>ds_cap</i>	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
<i>base</i>	VIRTIO guest physical start address of shared memory region
<i>offset</i>	Offset within the data space that is attached to the given <i>base</i> in the guest physical memory.
<i>size</i>	Size of the memory region in the guest

Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	The <i>ds_cap</i> capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or <i>size</i> and <i>offset</i> specify an invalid region.
<i>-L4_ENOMEM</i>	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.
<i><0</i>	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

long L4virtio::Device::set_status (

```

Write the VIRTIO status register.

Parameters

<i>status</i>	Status word to write to the VIRTIO status.
---------------	--

Return values

<i>0</i>	on success.
----------	-------------

Note

All other registers are accessed via shared memory.

```
void L4virtio::Driver::Device::driver_connect (
    L4::Cap< L4virtio::Device > srvcap,
    bool manage_notify = true ) [inline]
```

Contacts the device and starts the initial handshake.

Parameters

<i>srvcap</i>	Capability for device communication.
<i>manage_notify</i>	Set up a semaphore for notifications from the device. See below.

Exceptions

L4::Runtime_error	if the initialisation fails
-----------------------------------	-----------------------------

This function contacts the server, sets up the notification channels and the configuration dataspace. After this is done, the caller can set up any dataspace it needs. The initialisation then needs to be finished by calling [driver_acknowledge\(\)](#).

Per default this function creates and registers a semaphore for receiving notification from the device. This semaphore is used in the blocking functions [send_and_wait\(\)](#), [wait\(\)](#) and [next_used\(\)](#).

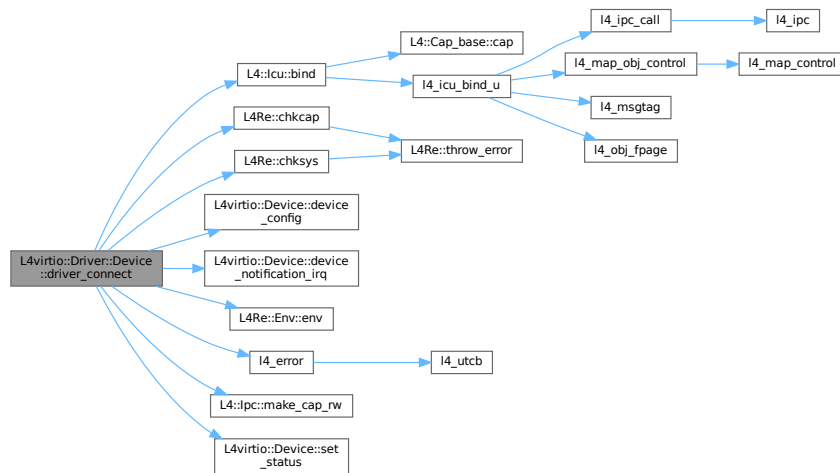

When `manage_notify` is false, then the caller may manually register and handle notification interrupts from the device. This is for example useful, when the client runs in an application with a server loop.

The result is only valid after [driver_acknowledge\(\)](#) was called (when the handshake with the device was completed).

Parameters

<i>feat</i>	The feature bit.

Return values

<i>true</i>	The feature is supported by both driver and device.

    l4_umword_t offset,
    l4_umword_t size,
    l4_uint64_t * devaddr ) [inline]
```

Share a dataspace with the device.

Parameters

<i>ds</i>	Dataspace to share with the device.
<i>offset</i>	Offset in dataspace where the shared part starts.
<i>size</i>	Total size in bytes of the shared space.
<i>devaddr</i>	Start of shared space in the device address space.

Although this function allows to share only a part of the given dataspace for convenience, the granularity of sharing is always the dataspace level. Thus, the remainder of the dataspace is not protected from the device.

When communicating with the device, addresses must be given with respect to the device address space. This is not the same as the virtual address space of the client in order to not leak information about the address space layout.

Parameters

<i>queue</i>	Queue that contains the request in its descriptor table
<i>descno</i>	Index of first entry in descriptor table where

15.378.1 Detailed Description

Driver-side implementation of a [Virtqueue](#).

Adds function for managing the descriptor list, enqueueing new and dequeueing finished requests.

Note

The [Virtqueue](#) implementation is not thread-safe.

Definition at line [482](#) of file [virtqueue](#).

15.378.2 Member Function Documentation

15.378.2.1 alloc_descriptor()

```
l4_uint16_t L4virtio::Driver::Virtqueue::alloc_descriptor ( ) [inline]
```

Allocate and return an unused descriptor from the descriptor table.

The descriptor will be removed from the free list, the content should be considered undefined. After use, it needs to be freed using [free_descriptor\(\)](#).

Returns

The index of the reserved descriptor or Virtqueue::Eoq if no free descriptor is available.

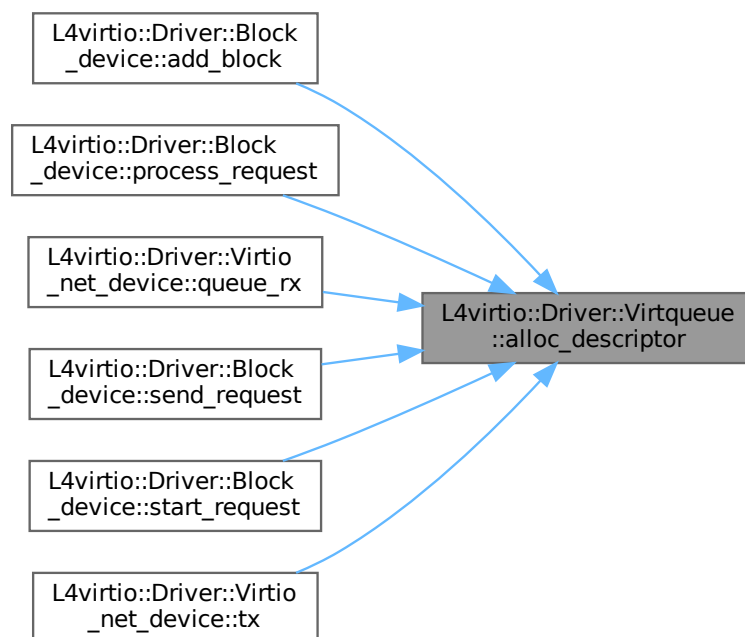

Note: the implementation uses $(2^{16} - 1)$ as the end of queue marker. That means that the final entry in the queue can not be allocated iff the queue size is 2^{16} .

```

Create a new virtio block device.

Parameters

<i>vendor</i>	Vendor ID

15.381.3.1 finalize_request()

```

template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::finalize_request (
    cxx::unique_ptr< Request > req,
    unsigned sz,
    l4_uint8_t status = L4VIRTIO_BLOCK_S_OK ) [inline]
  
```

Releases resources related to a request and notifies the client.

Parameters

<i>req</i>	Pointer to request that has finished.
<i>sz</i>	Number of bytes consumed.
<i>status</i>	Status of request (see L4virtio_block_status).

This function must be called when an asynchronous request finishes, either successfully or with an error. The status byte in the request must have been set prior to calling it.

```
template<typename Ds_data >
l4_uint8_t L4virtio::Svr::Block_dev_base< Ds_data >::get_writeback ( ) [inline], [protected]
```

Get the writeback field from the configuration space.

Returns

Value of the writeback field.

Definition at line 406 of file [virtio-block](#).

15.381.3.3 process_request()

```
template<typename Ds_data >
virtual bool L4virtio::Svr::Block_dev_base< Ds_data >::process_request (
    cxx::unique_ptr< Request > && req ) [pure virtual]
```

Implements the actual processing of data in the device.

Parameters

<i>req</i>	The request to be processed.
------------	------------------------------

Returns

If false, no further requests will be scheduled.

Synchronous and asynchronous processing of the data is supported. For asynchronous mode, the function should set up the worker and then return false. In synchronous mode, the function should return true, once processing is complete. If there is an error and processing is aborted, the status flag of `req` needs to be set accordingly and the request immediately finished with `finish_request()` if the client is to be answered.

15.381.3.4 set_blk_size()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_blk_size (
    14_uint32_t sz ) [inline], [protected]
```

Sets block disk size to be reported to the client.

Setting this does not change the logical sector size used for addressing the device.

Definition at line 350 of file [virtio-block](#).

15.381.3.5 set_config_wce()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_config_wce (
    14_uint8_t writeback ) [inline], [protected]
```

Sets cache mode and enables the writeback toggle.

Parameters

<i>writeback</i>	Mode of the cache (0 for writethrough, 1 for writeback).
------------------	--

Definition at line 393 of file [virtio-block](#).

15.381.3.6 set_discard()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_discard (
    14_uint32_t max_discard_sectors,
    14_uint32_t max_discard_seg,
    14_uint32_t discard_sector_alignment ) [inline], [protected]
```

Sets constraints for and enables the discard command.

Parameters

<i>max_discard_sectors</i>	Maximum discard sectors size.
<i>max_discard_seg</i>	Maximum discard segment number.
<i>discard_sector_alignment</i>	Can be used by the driver when splitting a request based on alignment.

Definition at line 420 of file [virtio-block](#).

15.381.3.7 set_size_max()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_size_max (
    14_uint32_t sz ) [inline], [protected]
```

Sets the maximum size of any single segment reported to client.

The limit is also applied to any incoming requests. Requests with larger segments result in an IO error being reported to the client. That means that [process_request\(\)](#) can safely make the assumption that all segments in the received request are smaller.

Definition at line 308 of file [virtio-block](#).

15.381.3.8 set_topology()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_topology (

    l4_uint8_t alignment_offset,
    l4_uint32_t min_io_size,
    l4_uint32_t opt_io_size ) [inline], [protected]
```

Sets the I/O alignment information reported back to the client.

Parameters

<i>physical_block_exp</i>	Number of logical blocks per physical block(log2)
<i>alignment_offset</i>	Offset of the first aligned logical block
<i>min_io_size</i>	Suggested minimum I/O size in blocks
<i>opt_io_size</i>	Optimal I/O size in blocks

Definition at line 366 of file [virtio-block](#).

15.381.3.9 set_write_zeroes()

```
template<typename Ds_data >
void L4virtio::Svr::Block_dev_base< Ds_data >::set_write_zeroes (
    l4_uint32_t max_write_zeroes_sectors,
    l4_uint32_t max_write_zeroes_seg,
    l4_uint8_t write_zeroes_may_unmap ) [inline], [protected]
```

Parameters

<i>max_write_zeroes_sectors</i>	Maximum write zeroes sectors size.
<i>max_write_zeroes_seg</i>	maximum write zeroes segment number.
<i>write_zeroes_may_unmap</i>	Set if a write zeroes request can result in deallocating one or more sectors.

15.384.1 Detailed Description

Abstraction for L4-Virtio device config memory.

Virtio defines a device configuration mechanism, L4-Virtio implements this mechanism based on shared memory a [set_status\(\)](#) and a [config_queue\(\)](#) call. This class provides an abstraction for L4-Virtio host implementations to establish such a shared memory data space and providing the necessary contents and access functions.

15.390.1 Detailed Description

Encapsulate the state for processing a VIRTIO request.

A VIRTIO request is a possibly chained list of descriptors retrieved from the available ring of a virtqueue, using [Virtqueue::next_avail\(\)](#).

The descriptor processing depends on helper (DESC_MAN) for interpreting the descriptors in the context of the device implementation.

DESC_MAN has to provide the functionality to safely dereference a descriptor from a descriptor list.

The following methods must be provided by DESC_MAN:

- `DESC_MAN::load_desc(Virtqueue::Desc const &desc,`
`Request_processor const *proc,`
`Virtqueue::Desc const **table)`

This function is used to dereference *desc* as an indirect descriptor table, and must return a pointer to an indirect descriptor table.

- `DESC_MAN::load_desc(Virtqueue::Desc const &desc,`
`Request_processor const *proc, ...)`

This function is used to dereference a descriptor as a normal data buffer, and '...' are the arguments that are passed to [start\(\)](#) and [next\(\)](#).

15.405.1 Detailed Description

Queue configuration entry.

An array of such entries is available at the [l4virtio_config_hdr_t::queues_offset](#) in the config data space.

Consistency rules for the queue config are:

- A driver might read `num_max` at any time.
- A driver must write to `num`, `desc_addr`, `avail_addr`, and `used_addr` only when `ready` is zero (0). Values in these fields are validated and used by the device only after successfully setting `ready` to one (1), either by the IPC or by `L4VIRTIO_CMD_CFG_QUEUE`.
- The value of `device_notify_index` is valid only when `ready` is one.
- The driver might write to `device_notify_index` at any time, however the change is guaranteed to take effect after a successful `L4VIRTIO_CMD_CFG_QUEUE` or after a `config_queue` IPC. Note, the change might also have immediate effect, depending on the device implementation.

00020  *      asm volatile ("btsl %1, %2" : "=ccc"(r) : "Jr"(63), "m"(m) : "memory");
00021  *
00022  * The compiler might chose the first variant because the bit number is smaller
00023  * than 64. However, 'bts' is encoded as 32-bit variant ('btsl') and thus only
00024  * supports immediate bit values up to 31. Some assemblers support immediate
00025  * offsets > 31 by adapting the memory address accordingly but GAS does not.

```

```

00026  * With GAS, the instruction will encode an immediate value of 63 but the CPU
00027  * will set bit 31 instead of bit 63!
00028  *
00029  * Therefore, if we would use 'btsl' instead of 'btsq', the correct constraint

16.126.1.1 l4io_get_root_device()

```
l4io_device_handle_t l4io_get_root_device (
    void ) [inline]
```

Get root device handle of the device bus.

Returns

root device handle

Definition at line 258 of file [io.h](#).

16.126.1.2 l4io_iterate_devices()

```
int l4io_iterate_devices (
    l4io_device_handle_t * devhandle,
    l4io_device_t * dev,
    l4io_resource_handle_t * reshandle )
```

Iterate over the device bus.

Parameters

in, out	<i>devhandle</i>	Device handle to start iterating at. The next device handle is returned here.
out	<i>dev</i>	Device information, may be NULL.
out	<i>reshandle</i>	Resource handle.

Returns

0 on success, error code otherwise

16.126.1.3 l4io_request_all_ioports()

```
void l4io_request_all_ioports (
    void(*) (l4vbus\_resource\_t const *res) res_cb )
```

Request all available IO-port resources.

Parameters

<code>res_cb</code>	Callback function called for every port resource found, give NULL for no callback.
---------------------	--

16.126.1.4 l4io_request_icu()

```
l4_cap_idx_t l4io_request_icu (
    void )
```

IPC stream.

16.161.2 Function Documentation

16.161.2.1 operator<<() [1/4]

```
L4::Ipc::Ostream & operator<< (
    L4::Ipc::Ostream & s,
    bool v ) [inline]
```

Insert an element to type `T` into the stream `s`.

Parameters

<code>s</code>	The stream to insert the element <code>v</code> .
<code>v</code>	The element to insert.

Returns

The stream `s`.

Definition at line 1202 of file [ipc_stream](#).

16.161.2.2 operator<<() [2/4]

```
L4::Ipc::Ostream & operator<< (
    L4::Ipc::Ostream & s,
    char const * v ) [inline]
```

Insert a zero terminated character string into the stream `s`.

Parameters

<i>s</i>	The stream to insert the string <i>v</i> .
<i>v</i>	The string to insert.

Returns

The stream *s*.

This operator produces basically the same content as the array insertion, however the length of the array is calculated using `strlen(v) + 1`. The string is copied into the message including the trailing zero.

L4::Ipc::Ostream & operator<< (
    L4::Ipc::Ostream & s,
    L4::Ipc::Internal::Buf_cp_out< T > const & v ) [inline]
  
```

Insert an array with elements of type *T* into the stream *s*.

Parameters

<i>s</i>	The stream to insert the array <i>v</i> .
<i>v</i>	The array to insert (see <code>Ipc::Buf_cp_out()</code>).

Returns

The stream *s*.

```
L4::Ipc::Ostream & operator<< (  
    L4::Ipc::Ostream & s,  
    l4_msgtag_t const & v ) [inline]
```

Insert the [L4](#) message tag into the stream *s*.

Parameters

<i>s</i>	The stream to insert the tag <i>v</i> .
<i>v</i>	The L4 message tag to insert.

Returns

The stream *s*.

Note

Only one message tag can be inserted into a stream. Multiple insertions simply overwrite previous insertions.

```
L4::Ipc::Istream & operator>> (

```

Extract one element of type T from the stream s.

Parameters

	<i>s</i>	The stream to extract from.
out	<i>v</i>	Extracted value.

Returns

```

Extract an array of *T* elements from the stream *s*.

Parameters

	<i>s</i>	The stream to extract from.
out	<i>v</i>	Buffer description to copy the array to (<code>Ipc::Buf_cp_out()</code>).

Returns

The stream *s*.

This operator does a copy out of the data into the given buffer.

L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    L4::Ipc::Internal::Buf_in< T > const & v ) [inline]
  
```

Extract an array of T elements from the stream s.

Parameters

	s	The stream to extract from.
out	v	Pointer to the extracted array (ipc_buf_in()).

Returns

The stream s.

This operator actually does not copy out the data in the array, but returns a pointer into the message buffer itself. This means that the data is only valid as long as there is no new data inserted into the stream.

Note

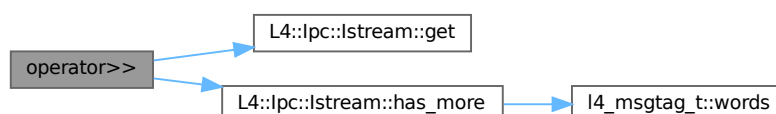

If array does not fit into transmitted words size will be set to zero. Client has to implement check against zero.

16.249.3 Typedef Documentation

16.249.3.1 gfxbitmap_color_pix_t

```
typedef unsigned int gfxbitmap_color_pix_t
```

Specific color type.

This color type is specific for a particular framebuffer, it can be use to write pixel on a framebuffer. Use `gfxbitmap_convert_color` to convert from `gfxbitmap_color_t` to `gfxbitmap_color_pix_t`.

Definition at line 64 of file [bitmap.h](#).

16.249.3.2 gfxbitmap_color_t

```
typedef unsigned int gfxbitmap_color_t
```

Standard color type.

It's a RGB type with 8bits for each channel, regardless of the framebuffer used.

Enumerator

L4RE_DMA_SPACE_BIDIRECTIONAL	device reads and writes to the memory
L4RE_DMA_SPACE_TO_DEVICE	device reads the memory
L4RE_DMA_SPACE_FROM_DEVICE	device writes to the memory
L4RE_DMA_SPACE_NONE	device is coherently connected

[Space_attrbs](#)

Enumerator

L4RE_DMA_SPACE_COHERENT	The device is connected coherently with the cache. This means that the map() and unmap() do not need to sync CPU caches before and after DMA.
L4RE_DMA_SPACE_PHYS_SPACE	The DMA space has no DMA task assigned and uses the CPUs physical memory.

0 for success, <0 on error.

    l4_cap_idx_t cap,
    char * name,
    unsigned len,
    l4_mword_t current_id )
```

Get information for the next available inhibitor lock.

Parameters

<i>cap</i>	Capability to the Inhibitor object (see L4Re::Inhibitor)
<i>name</i>	A pointer to a buffer for the name of the lock.
<i>len</i>	The length of the available buffer (usually L4Re::Inhibitor::Name_max is used).
<i>current_id</i>	The ID of the last available lock, use -1 to get the first lock.

Return values

>0	The ID of the next available lock if there is one (in this case name shall contain the name of the inhibitor lock).
-L4_ENODEV	if there are no more locks.
<0	Any other negative failure value.

Allocate state area.

16.276.1 Detailed Description

Kumem allocator utility C interface.

Definition in file [kumem_alloc.h](#).

16.276.2 Function Documentation

16.276.2.1 l4re_util_kumem_alloc()

```
int l4re_util_kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    l4_cap_idx_t task,
    l4_cap_idx_t rm )
```

Allocate state area.

Parameters

out	<i>mem</i>	Pointer to memory that has been allocated.
	<i>pages_order</i>	Size to allocate, in log2 pages.
	<i>task</i>	Task to use for allocation.
	<i>rm</i>	Region manager to use for allocation.

Return values

0	for success
<0	error code on failure

Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

```
void l4shmc_rb_attach_receiver (  
    l4shmc_ringbuf_t * buf,  
    l4_cap_idx_t owner )
```

Attach to receiver signal of a ring buffer.

Attach owner to the receiver-side signal of a ring buffer, which is triggered whenever new data has been produced.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>owner</i>	owner thread

16.391.2.2 l4shmc_rb_attach_sender()

```
int l4shmc_rb_attach_sender (
    l4shmc_ringbuf_t * buf,
    char const * signal_name,
    l4_cap_idx_t owner )
```

Attach to sender signal of a ring buffer.

Attach owner to the sender-side signal of a ring buffer, which is triggered whenever new space has been freed in the buffer for the sender to write to.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>signal_name</i>	signal base name
<i>owner</i>	owner thread

Returns

0 on success, error otherwise

16.391.2.3 l4shmc_rb_deinit_buffer()

```
void l4shmc_rb_deinit_buffer (
    l4shmc_ringbuf_t * buf )
```

De-init a ring buffer.

Parameters

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

16.391.2.4 l4shmc_rb_init_buffer()

```
int l4shmc_rb_init_buffer (
    l4shmc_ringbuf_t * buf,
    l4shmc_area_t * area,
    char const * chunk_name,
```

```
char const * signal_name,  
unsigned size )
```

Initialize a ring buffer by creating an SHMC chunk and the corresponding signals.

This needs to be done by one of the participating parties when setting up communication channel.

Precondition

area has been attached using [l4shmc_attach\(\)](#).

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>area</i>	pointer to SHMC area
<i>chunk_name</i>	name of SHMC chunk to create in area
<i>signal_name</i>	base name for SHMC signals to create
<i>size</i>	chunk size

Returns

0 on success, error otherwise

16.391.2.5 l4shmc_rb_init_receiver()

```
int l4shmc_rb_init_receiver (  
    l4shmc_ringbuf_t * buf,  
    l4shmc_area_t * area,  
    char const * chunk_name,  
    char const * signal_name )
```

Initialize receive buffer.

Initialize the receiver-side of a ring buffer. This requires the underlying SHMC chunk and the corresponding signals to be valid already (read: to be initialized by the sender).

Precondition

chunk & signals have been created and initialized by the sender side

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>area</i>	pointer to SHMC area
<i>chunk_name</i>	name of SHMC chunk to create in area
<i>signal_name</i>	base name for SHMC signals to create

Returns

0 on success, error otherwise

16.391.2.6 l4shmc_rb_receiver_copy_out()

```
int l4shmc_rb_receiver_copy_out (
    l4shmc_ringbuf_head_t * head,
    char * target,
    unsigned * tsize )
```

Copy data out of the buffer.

Parameters

	<i>head</i>	ring buffer head pointer
	<i>target</i>	valid target buffer
<i>in, out</i>	<i>tsize</i>	size of target buffer (must be \geq packet size!); contains the real data size

Returns

0 on success, negative error otherwise

16.391.2.7 l4shmc_rb_receiver_notify_done()

```
void l4shmc_rb_receiver_notify_done (
    l4shmc_ringbuf_t * buf )
```

Notify producer that space is available.

Parameters

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

16.391.2.8 l4shmc_rb_receiver_read_next_size()

```
int l4shmc_rb_receiver_read_next_size (
    l4shmc_ringbuf_head_t * head )
```

Have a look at the ring buffer and see which size the next packet to be read has.

Does not modify anything.

Returns

size of next buffer or -1 if no data available

16.391.2.9 l4shmc_rb_receiver_wait_for_data()

```
int l4shmc_rb_receiver_wait_for_data (
    l4shmc_ringbuf_t * buf,
    int blocking )
```

Check if (and optionally block until) new data is ready.

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>blocking</i>	block if data is not available immediately

Returns immediately, if data is available.

Returns

0 success, data available, != 0 otherwise

16.391.2.10 l4shmc_rb_sender_alloc_packet()

```
char * l4shmc_rb_sender_alloc_packet (
    l4shmc_ringbuf_head_t * head,
    unsigned psize )
```

Allocate a packet of a given size within the ring buffer.

This packet may wrap around at the end of the buffer. Users need to be aware of that.

Parameters

<i>head</i>	ring buffer head pointer
<i>psize</i>	packet size

valid address on success

Return values

<i>NULL</i>	if not enough space available
-------------	-------------------------------

16.391.2.11 l4shmc_rb_sender_commit_packet()

    l4shmc_ringbuf_t * buf,
    char * data,
    unsigned size,
    int block_if_necessary )
```

Copy in packet from an external data source.

This is the function you'll want to use. Just pass it a buffer pointer and let the lib do the work.

Parameters

<i>buf</i>	pointer to ring buffer struct
<i>data</i>	valid buffer
<i>size</i>	data size
<i>block_if_necessary</i>	bool: block if buffer currently full

Return values

0	on success

    l4shmc_ringbuf_t * buf,
    char * addr,
    char * data,
    unsigned dsize )
```

Copy data into a previously allocated packet.

This function is wrap-around aware.

Parameters

<i>buf</i>	pointer to ring buffer struct

C interface for calling the ARM secure monitor, see [L4::Arm_smccc::call\(\)](#) for the C++ interface.

Parameters

<i>pfc</i>	Capability of the SMC kernel object.
------------	--------------------------------------

The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.

Parameters

	<i>func</i>	Function identifier. <ul style="list-style-type: none"> • Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel. • Bit 30 defines the calling convention: • Bit 30 == 1: 64-bit calling convention. • Bit 30 == 0: 32-bit calling convention. • Bits 24..29 determine the service call ID. Only service IDs $\geq 0x30000000$ (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed.
in	<i>in0</i>	First input parameter.
in	<i>in1</i>	Second input parameter.
in	<i>in2</i>	Third input parameter.
in	<i>in3</i>	Fourth input parameter.
in	<i>in4</i>	Fifth input parameter.
in	<i>in5</i>	Sixth input parameter.
out	<i>out0</i>	First output parameter.
out	<i>out1</i>	Second output parameter.
out	<i>out2</i>	Third output parameter.
out	<i>out3</i>	Fourth output parameter.
in	<i>client_id</i>	Client ID. According to the specification, this value might be ignored by certain functions.

Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID $< 0x30000000$.
-L4_EINVAL	Invalid number of parameters.
< 0	Other L4 error.
0	Success.

16.433.2.1 anonymous enum

anonymous enum

Defaults for local thread priorities.

Priorities are to be seen as local. These are used by the loader and libpthread. They are to be understood as 'local', which means the actual priority of the thread (as seen by the kernel) is the base priority as defined by the scheduler plus the local priority.

16.445.1 Macro Definition Documentation

16.445.1.1 L4_RPC_DEF

```
#define L4_RPC_DEF(
    name )
```

Value:

```
template struct L4::Ipc::Msg::Rpc_call \
    <name##_t, name##_t::class_type, name##_t::ipc_type, name##_t::flags_type>
```

Generate the definition of an RPC stub.

Parameters

<i>name</i>	The fully qualified method name to be implemented, this means <code>class::method</code> .
-------------	--

This macro generates the definition (implementation) for the given RPC interface method.

16.448.2 Macro Definition Documentation

16.448.2.1 L4_INLINE_RPC

```
#define L4_INLINE_RPC(  
    res,  
    name,  
    args,  
    attr... ) res name args
```

Define an inline RPC call (type and callable).

Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function (<i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function.
<i>attr</i>	Optional RPC attributes (L4::ipc::Call , L4::ipc::Call_t etc.).

Definition at line 469 of file [ipc_iface](#).

16.448.2.2 L4_INLINE_RPC_NF

```
#define L4_INLINE_RPC_NF(
    res,
    name,
    args... )
```

Value:

```
struct name##_t : L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> \
{ \
    typedef L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> type; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}
```

Define an inline RPC call type (the type only, no callable).

Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function (<i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function, and RPC attributes (L4::ipc::Call , L4::ipc::Call_t etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

Definition at line 440 of file [ipc_iface](#).

16.448.2.3 L4_INLINE_RPC_NF_OP

```
#define L4_INLINE_RPC_NF_OP(
    op,
    res,
    name,
    args... )
```

Value:

```
struct name##_t : L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> \
{ \
    typedef L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> type; \
    enum { Opcode = (op) }; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}
```

Define an inline RPC call type with specific opcode (the type only, no callable).

Parameters

<i>op</i>	The opcode number for this function
<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function (<i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function, and RPC attributes (L4::lpc::Call , L4::lpc::Call_t etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

16.462.1 Macro Definition Documentation

16.462.1.1 L4_TYPES_FLAGS_OPS_DEF

```
#define L4_TYPES_FLAGS_OPS_DEF (
    T )
```

Value:

```
friend constexpr T operator ~ (T f)
{
    return T(~((typename L4::Types::Int_for_type<T>::type)f));
}

friend constexpr T operator | (T l, T r)
{
    return T(((typename L4::Types::Int_for_type<T>::type)l)
              | ((typename L4::Types::Int_for_type<T>::type)r));
}

friend constexpr T operator & (T l, T r)
{
    return T(((typename L4::Types::Int_for_type<T>::type)l)
              & ((typename L4::Types::Int_for_type<T>::type)r));
}
```

Helper macro to define a set of bitwise operators on an enum type.

This allows to use the enum type as bitmask type with '&', '|', and '~' operators that keep the enum type as result.

16.490.1 Detailed Description

The C IPC gate interface, see [L4::ipc_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) that is *bound* to the IPC gate (cf. [l4_rcv_ep_bind_thread\(\)](#)). If the capability has the [L4_FPAGE_C_IPCGATE_SVR](#) permission, only IPC using a protocol different from the [L4_PROTO_KOBJECT](#) protocol is forwarded. Without the [L4_FPAGE_C_IPCGATE_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When no thread is bound yet, the forwarded IPC blocks until a thread is bound or the IPC times out.

Forwarded IPC is always forwarded to the userland of the bound thread. That means, the [Thread](#) interface of the bound thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4_FPAGE_C_IPCGATE_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4_FPAGE_C_IPCGATE_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the bound thread instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4_FPAGE_C_IPCGATE_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding a thread to an IPC gate, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (cf. [l4_rcv_ep_bind_thread\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are the result of bitwise disjunction of the corresponding label bits with the [L4_CAP_FPAGE_S](#) and [L4_CAP_FPAGE_W](#) permissions of the capability used. Hence, the label provided via [l4_rcv_ep_bind_thread\(\)](#) should usually have its two least significant bits set to zero. The replaced label is only visible to the bound thread upon receive. However, the configured label of an IPC gate can also be queried via [l4_ipc_gate_get_infos\(\)](#) if the capability used has the [L4_FPAGE_C_IPCGATE_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4_thread_modify_sender_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread for the first time.

When binding a new thread to an IPC gate that is currently bound, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

16.564.2.1 l4_assert

```
#define l4_assert(  
    expr )
```

Value:

```
l4_assert_fn(expr, __FILE__ ":" L4_stringify(__LINE__) ": Assertion \"" \
    L4_stringify(expr) "\" failed.\n")
```

Low-level assert.

Parameters

<i>expr</i>	Expression to be evaluate for the assertion.
-------------	--

This assertion is a low-level implementation that directly uses kernel primitives. Only use [l4_assert\(\)](#) when the standard `assert()` functionality is not available.

```

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. *s* must be a character pointer (`char const *`) initialized with [l4_kip_version_string\(\)](#).

```
int l4_kip_kernel_has_feature (  
    l4_kernel_info_t const * kip,  
    char const * str ) [inline]
```

Check if kernel supports a feature.

Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
<i>str</i>	Feature name to check.

Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

16.611.2.1 __L4UTIL_THREAD_FUNC

```
#define __L4UTIL_THREAD_FUNC(  
    name ) void L4_NORETURN name(void)
```

Defines a wrapper function that sets up the registers according to the calling conventions for the architecture.

Use this as a function header when starting a low-level thread where only stack and instruction pointer are in a well-defined state.

Example:

```
L4UTIL_THREAD_FUNC(helper_thread) { l4_infinite_loop(); }
```

```
thread_cap->ex_regs((l4_umword_t)helper_thread, stack_addr);
```

16.622.1 Detailed Description

This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.

Definition in file [vbus_interfaces.h](#).

16.622.2 Typedef Documentation

16.622.2.1 l4vbus_iface_type_t

```
typedef enum l4vbus_iface_type_t l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.

The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.

The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS_IFACE_SHIFT). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

16.622.3.1 anonymous enum

```

Enumerator

L4VBUS_IFACE_SHIFT	Sub-interface ID shift. Divides the function opcode sent via IPC into a sub-interface ID and the actual function opcode within the sub-interface.

16.622.4 Function Documentation

16.622.4.1 l4vbus_subinterface_supported()

```
int l4vbus_subinterface_supported (
    l4_uint32_t dev_type,
    l4vbus_iface_type_t iface_type ) [inline]
```

Check if a vbus device supports a given sub-interface.

Parameters

<i>dev_type</i>	Device type as reported in l4vbus_device_t .
<i>iface_type</i>	Sub-interface type to check for.

Returns

True if the device supports the sub-interface.

16.635.2.1 l4_vcpu_check_version()

```
int l4_vcpu_check_version (
    l4_vcpu_state_t const * vcpu )    [inline]
```

Check if a vCPU state has the right version.

Parameters

<i>vcpu</i>	A pointer to an initialized vCPU state.
-------------	---

Return values

1	If the vCPU state has a matching version ID for the current vCPU user-level structures.
0	If the vCPU state has a different (incompatible) version ID than the current vCPU user-level structures.
