MKC - Exercise 1

Nils Asmussen

2018-05-17
Roadmap

• Brief intro/review on kernel bootstrapping
• Start within minimal kernel
• Leave kernel to userland via iret
• Reenter via sysenter
• Do very basic syscalls (nop, add, ...)

Get the Code

$ git clone https://os.inf.tu-dresden.de/repo/git/mkc.git
$ git checkout exercise1

# build it
$ make

# run it
$ make run
• Open src/start.S
• Hard-coded segment descriptor table
• Execution starts at symbol __start
• Setup boot page table
• Enable paging
• Load segment selectors
• Call init()
Initial Machine State

- Protected mode, no paging, but segmentation
- All segments: base 0, limit 0xFFFF FFFF
- CS: 32bit r+x code segment
- DS,ES,FS,GS,SS: 32bit r+w data segment
- Exact values are undefined
- See Multiboot Specification for details

```
virtual memory

EIP
▼
Kernel physical memory
```
Setup Memory

- Setup boot page table
Setup Memory

- Setup boot page table
- Enable paging, thus use page tables to fetch next instruction (therefore need 1:1 mapping)
• Setup boot page table
• Enable paging, thus use page tables to fetch next instruction (therefore need 1:1 mapping)
• Jump to high memory
  – This changes the EIP, but the 'old' stack from 1:1 mapping is still in use, need to switch later
• Open src/init.cc
• Setup serial port for early debug output
• Map new kernel stack
• Setup GDT, IDT, GSI, and TSS
• Init PIC, mask all IRQs or install handlers
• Prepare Sysenter (CS,EIP,ESP)
• Switches stack
• Again, src/init.cc, bootstrap

• Removes 1:1 mapping
• Flushes TLB
• Creates new EC (thread) for our user-code
• Switches to that EC
• Open src/ec.cc: `root_invoke()`

• Prepare address space
  – Map 1 page user stack (at address 0x1000)
  – Map 1 page user code (at address 0x2000)

• Prepare stack frame to be used with `iret`
  – User code segment + instr. pointer (CS, EIP)
  – User stack segment + stack pointer (SS, ESP)
  – No Data segment for now

• IRET: loads CS:EIP, SS:ESP and EFLAGS
IRET stack layout

- (kernel) ESP points to array with ES:EIP, EFLAGS and SS:ESP
- IRET (atomically) loads registers and switches from privilege level 0 to 3
- Fetches and starts executing first instruction from new instruction pointer
• User code starts in function usercode, thus
  \texttt{mword code = reinterpret\_cast<\texttt{mword}>(&usercode);}

• Adjust new EIP to point within page at 0x2000
  \texttt{code = (code \& \texttt{PAGE\_MASK}) + 2 \times \texttt{PAGE\_SIZE};}

• Handcraft stack frame and \texttt{IRET}
Inline assembly in a nutshell

```
asm volatile (  
    "nop;"  
    : <out> : <in> : <clobber> );

mword i=2, j=3;
asm volatile (  
    "add %%ebx, %%eax;"  
    : "+a" (i) : "b" (j) );
printf ("%d %d\n",i,j);
```

• Load esp with addr of stack frame and do 'iret'
• Prepare array with 5 elements and `iret`
  - Code : user instruction pointer to exit to
  - SEL_USER_CODE : new CS (include/selectors.h)
  - 0x200 : EFLAGS, just set interrupt enabled flag
  - 2 * PAGE_SIZE : new stack pointer
  - SEL_USER_DATA : new SS stack segment

• Open src/usercode.cc : usercode()
  - 1\textsuperscript{st} Fault immediately
  - 2\textsuperscript{nd} reenter kernel via `sysenter`
  - 3\textsuperscript{rd} prepare `sysexit` by loading ecx and edx with proper values (ESP and EIP after returning)
  - 4\textsuperscript{th} do simple system calls, like add 2 numbers
Hello user

- Open src/usercode.cc, function usercode()

- To check if everything is ok, fault immediately
  - asm ("ud2"); → exception #6
  - Ec::handle_exc 0x6 (eip=0x2016 cr2=0x0)

  - Force a page fault by reading or writing to an address somewhere below 0x1000
  - Ec::handle_exc 0xe (eip=0x2016 cr2=0x23)
