IBM

If you ...

- have a solid database background, including knowledge of SQL,
- possess good programming skills in C, C++, or Java,
- like implementation work

... and you are interested in ...

- gaining practical knowledge and experience in one of the leading database companies for a period of 9 months or more,
- working on exciting topics in state-of-the-art technologies, such as object-relational databases, business intelligence and OLAP, digital libraries, and web access to data,
- checking out 'real life' in the Silicon Valley software development industry,

... then we'd like to hear from you.

IBM's Database Technology Institute is frequently offering student internship positions at its Santa Teresa Laboratory in San Jose, California. With technology transfer as its major mission, the Database Technology Institute is working closely with IBM's research labs, integrating new technologies into data management products such as DB2 Universal Database.

In addition to an attractive work environment, the geographic location of the lab in the Bay Area (approx. 50 miles south of San Francisco) offers a wide range of off-work activities and events, providing the opportunity to gain both professional and cultural experience.

If you are interested in learning more about our student internship program, please write or send email to
