

# L4Re Operating System Framework

Generated on Sat Aug 24 2024 16:07:24 for L4Re Operating System Framework by Doxygen  
1.9.8

Sat Aug 24 2024 16:07:24

<b>1 Overview</b>	<b>1</b>
<b>2 Introduction</b>	<b>3</b>
2.1 L4Re Microkernel	3
2.1.1 Communication	3
2.1.2 Kernel Objects	4
2.2 L4Re System Structure	4
2.3 L4Re Runtime Environment	6
<b>3 Tutorial</b>	<b>7</b>
3.1 Customizations	8
<b>4 Programming for L4Re</b>	<b>9</b>
4.1 L4 Inter-Process Communication (IPC)	9
4.1.1 IPC mechanism	10
4.1.1.1 IPC Flags	10
4.1.1.2 Partner capability selector	11
4.1.1.3 IPC Label	11
4.1.1.4 IPC Message Tag	11
4.1.1.5 IPC Timeouts	12
4.1.1.6 User-level Thread Control Block	13
4.1.1.7 Transfer of Typed Send Items	15
4.1.2 Examples	15
4.1.2.1 User Thread to Kernel Object	16
4.1.2.2 User Thread to User Thread	16
4.1.2.3 User Thread to User Object	18
4.2 Capabilities and Naming	18
4.3 Spaces and Mappings	19
4.4 Initial Environment and Application Bootstrapping	20
4.4.1 Configuring an application before startup	21
4.4.2 Connecting clients and servers	21
4.5 Memory management - Data Spaces and the Region Map	22
4.5.1 User-level paging	22
4.5.1.1 Data spaces	22
4.5.1.2 Virtual Memory Handling	22
4.5.1.3 Memory Allocation	22
4.6 Program Input and Output	23
4.7 Initial Memory Allocator and Factory	23
4.8 Application and Server Building Blocks	23
4.8.1 Creating Additional Application Threads	23
4.8.2 Providing a Service	24
4.9 Pthread Support	24
4.10 Interface Definition Language	25

4.10.1 Parameter types for RPC	26
4.10.2 RPC Return Types	27
4.10.3 RPC Method Declaration	27
4.11 L4Re Build System	28
4.11.1 Building L4Re	28
4.11.2 Writing BID Make Files	29
4.11.3 prog.mk - Application Role	30
4.11.4 include.mk - Header File Role	32
4.11.5 test.mk - Test Application Role	33
4.12 Kernel Factory	40
4.12.1 Passing parameters for the create stream	41
<b>5 L4Re Servers</b>	<b>43</b>
5.1 Sigma0, the Root-Pager	45
5.1.1 Factory	45
5.2 Moe, the Root-Task	45
5.2.1 Moe objects	45
5.2.1.1 Factory	46
5.2.1.2 Namespace	47
5.2.1.3 Dataspace	48
5.2.1.4 Log Subsystem	48
5.2.1.5 DMA Space	48
5.2.1.6 Scheduler subsystem	48
5.2.1.7 Region Map	48
5.2.2 Command Line Options	48
5.3 Ned, the Init Process	49
5.3.1 Lua Bindings for L4Re	49
5.3.1.1 Capabilities in Lua	50
5.3.1.2 Access to L4Re::Env Capabilities	50
5.3.1.3 Constants	50
5.3.1.4 Application Startup Details	51
5.3.1.5 Reacting on task termination	52
5.3.1.6 Access to the kernel debugger	52
5.3.1.7 Using the interactive ned prompt	53
5.3.2 Command Line Options	53
5.4 Io, the Io Server	53
5.5 AHCI driver	59
5.6 Cons, the Console Multiplexer	61
5.7 Mag, the GUI Multiplexer	62
5.8 NVMe server	64
5.9 Uvmm, the virtual machine monitor	67
5.9.1 RAM configuration	75

5.10 l4vio_net_p2p, a virtual network point-to-point link . . . . .	76
<b>6 Bootstrap, the L4 kernel bootstrapper</b>	<b>79</b>
<b>7 Deprecated List</b>	<b>83</b>
<b>8 Topic Index</b>	<b>85</b>
8.1 Topics . . . . .	85
<b>9 Namespace Index</b>	<b>89</b>
9.1 Namespace List . . . . .	89
<b>10 Hierarchical Index</b>	<b>91</b>
10.1 Class Hierarchy . . . . .	91
<b>11 Data Structure Index</b>	<b>103</b>
11.1 Data Structures . . . . .	103
<b>12 File Index</b>	<b>119</b>
12.1 File List . . . . .	119
<b>13 Topic Documentation</b>	<b>131</b>
13.1 Base API . . . . .	131
13.1.1 Detailed Description . . . . .	134
13.1.2 Basic Macros . . . . .	134
13.1.2.1 Detailed Description . . . . .	136
13.1.2.2 Macro Definition Documentation . . . . .	136
13.1.2.3 Function Documentation . . . . .	137
13.1.3 C++ IPC Interface Definition. . . . .	138
13.1.3.1 Detailed Description . . . . .	138
13.1.3.2 Internal Helpers . . . . .	138
13.1.4 Cache Consistency . . . . .	139
13.1.4.1 Detailed Description . . . . .	139
13.1.4.2 Function Documentation . . . . .	139
13.1.5 Capabilities . . . . .	142
13.1.5.1 Detailed Description . . . . .	143
13.1.5.2 Typedef Documentation . . . . .	143
13.1.5.3 Enumeration Type Documentation . . . . .	143
13.1.5.4 Function Documentation . . . . .	144
13.1.6 Error codes . . . . .	146
13.1.6.1 Detailed Description . . . . .	147
13.1.6.2 Enumeration Type Documentation . . . . .	147
13.1.7 Fiasco extensions . . . . .	148
13.1.7.1 Detailed Description . . . . .	149
13.1.7.2 Function Documentation . . . . .	149

13.1.7.3 Fiasco real time scheduling extensions	151
13.1.7.4 Kernel Debugger	152
13.1.7.5 Kernel Tracing	159
13.1.8 Flex pages	162
13.1.8.1 Detailed Description	164
13.1.8.2 Enumeration Type Documentation	164
13.1.8.3 Function Documentation	169
13.1.9 Integer Types	180
13.1.9.1 Detailed Description	181
13.1.10 Kernel Interface Page	182
13.1.10.1 Detailed Description	183
13.1.10.2 Enumeration Type Documentation	183
13.1.10.3 Function Documentation	184
13.1.10.4 Fiasco-UX Virtual devices	188
13.1.10.5 Memory descriptors (C version)	189
13.1.11 Kernel Objects	194
13.1.11.1 Detailed Description	195
13.1.11.2 DMA space	195
13.1.11.3 Factory	196
13.1.11.4 IPC-Gate API	205
13.1.11.5 IRQs	208
13.1.11.6 Interrupt controller	222
13.1.11.7 Kernel-provided semaphore	238
13.1.11.8 L4 kernel object type information	240
13.1.11.9 Platform Control C API	241
13.1.11.10 Scheduler	247
13.1.11.11 Task	255
13.1.11.12 Thread	265
13.1.11.13 Virtual Console	296
13.1.11.14 Virtual Machines	311
13.1.12 Memory operations.	330
13.1.12.1 Detailed Description	330
13.1.12.2 Enumeration Type Documentation	330
13.1.12.3 Function Documentation	331
13.1.13 Memory related	332
13.1.13.1 Detailed Description	333
13.1.13.2 Macro Definition Documentation	333
13.1.13.3 Enumeration Type Documentation	335
13.1.13.4 Function Documentation	336
13.1.14 Object Invocation	340
13.1.14.1 Detailed Description	341
13.1.14.2 Timeouts during IPC	342

13.1.14.3 Enumeration Type Documentation . . . . .	342
13.1.14.4 Function Documentation . . . . .	343
13.1.14.5 Error Handling . . . . .	358
13.1.14.6 Message Items . . . . .	364
13.1.14.7 Message Tag . . . . .	367
13.1.14.8 Realtime API . . . . .	381
13.1.14.9 Timeouts . . . . .	381
13.1.14.10 Virtual Registers (UTCBS) . . . . .	389
13.2 EDID parsing functionality . . . . .	401
13.2.1 Detailed Description . . . . .	402
13.2.2 Enumeration Type Documentation . . . . .	402
13.2.2.1 Libedid_consts . . . . .	402
13.2.3 Function Documentation . . . . .	402
13.2.3.1 libedid_check_header() . . . . .	402
13.2.3.2 libedid_checksum() . . . . .	403
13.2.3.3 libedid_dump() . . . . .	403
13.2.3.4 libedid_dump_standard_timings() . . . . .	403
13.2.3.5 libedid_num_ext_blocks() . . . . .	404
13.2.3.6 libedid_pnp_id() . . . . .	404
13.2.3.7 libedid_prefered_resolution() . . . . .	404
13.2.3.8 libedid_revision() . . . . .	405
13.2.3.9 libedid_version() . . . . .	405
13.3 IO interface . . . . .	405
13.3.1 Detailed Description . . . . .	406
13.3.2 Typedef Documentation . . . . .	406
13.3.2.1 l4io_resource_t . . . . .	406
13.3.3 Enumeration Type Documentation . . . . .	406
13.3.3.1 l4io_device_types_t . . . . .	406
13.3.3.2 l4io_iomem_flags_t . . . . .	407
13.3.3.3 l4io_resource_types_t . . . . .	407
13.3.4 Function Documentation . . . . .	407
13.3.4.1 l4io_has_resource() . . . . .	407
13.3.4.2 l4io_lookup_device() . . . . .	408
13.3.4.3 l4io_lookup_resource() . . . . .	408
13.3.4.4 l4io_release_iomem() . . . . .	409
13.3.4.5 l4io_release_ioport() . . . . .	409
13.3.4.6 l4io_request_iomem() . . . . .	409
13.3.4.7 l4io_request_iomem_region() . . . . .	410
13.3.4.8 l4io_request_ioport() . . . . .	411
13.3.4.9 l4io_request_resource_iomem() . . . . .	411
13.4 IPC Helpers . . . . .	412
13.4.1 Detailed Description . . . . .	412

13.4.2 Function Documentation	412
13.4.2.1 throw_ipc_exception() [1/2]	412
13.4.2.2 throw_ipc_exception() [2/2]	413
13.5 IRQ handling library	414
13.5.1 Detailed Description	414
13.5.2 Interface for asynchronous ISR handlers.	414
13.5.2.1 Detailed Description	415
13.5.2.2 Function Documentation	415
13.5.2.3 Interface for asynchronous ISR handlers with a given IRQ capability.	416
13.5.3 Interface using direct functionality.	417
13.5.3.1 Detailed Description	418
13.5.3.2 Function Documentation	418
13.5.3.3 Interface using direct functionality.	421
13.6 L4 IPC Opcodes	423
13.6.1 Detailed Description	424
13.6.2 Enumeration Type Documentation	424
13.6.2.1 L4_icu_opcode	424
13.6.2.2 L4_ipc_gate_ops	425
13.6.2.3 L4_platform_ctl_ops	425
13.6.2.4 L4_task_ops	426
13.6.2.5 L4_thread_ops	426
13.6.2.6 L4_vcon_ops	427
13.7 L4 VIRTIO Interface	427
13.7.1 Detailed Description	428
13.7.2 L4 VIRTIO Block Device	428
13.7.2.1 Detailed Description	428
13.7.2.2 Enumeration Type Documentation	428
13.7.3 L4 VIRTIO Input Device	429
13.7.3.1 Detailed Description	430
13.7.4 L4 VIRTIO Network Device	430
13.7.4.1 Detailed Description	431
13.7.5 L4 VIRTIO Transport Layer	431
13.7.5.1 Detailed Description	432
13.7.5.2 Typedef Documentation	433
13.7.5.3 Enumeration Type Documentation	433
13.7.5.4 Function Documentation	435
13.8 L4 Vbus functions	439
13.8.1 Detailed Description	440
13.8.2 Enumeration Type Documentation	440
13.8.2.1 L4vbus_dma_domain_assign_flags	440
13.8.3 Function Documentation	441
13.8.3.1 l4vbus_assign_dma_domain()	441

13.8.3.2 l4vbus_get_adr()	442
13.8.3.3 l4vbus_get_device()	442
13.8.3.4 l4vbus_get_device_by_hid()	443
13.8.3.5 l4vbus_get_hid()	444
13.8.3.6 l4vbus_get_next_device()	444
13.8.3.7 l4vbus_get_resource()	446
13.8.3.8 l4vbus_is_compatible()	447
13.8.3.9 l4vbus_release_ioport()	448
13.8.3.10 l4vbus_request_ioport()	448
13.8.3.11 l4vbus_vicu_get_cap()	449
13.8.4 L4vbus GPIO functions	450
13.8.4.1 Detailed Description	451
13.8.4.2 Enumeration Type Documentation	451
13.8.4.3 Function Documentation	451
13.8.5 L4vbus PCI functions	459
13.8.5.1 Detailed Description	460
13.8.5.2 Function Documentation	460
13.8.6 L4vbus power management functions	465
13.8.6.1 Detailed Description	465
13.8.6.2 Function Documentation	465
13.9 L4Re C Interface	467
13.9.1 Detailed Description	469
13.9.2 Capability allocator	469
13.9.2.1 Detailed Description	470
13.9.2.2 Function Documentation	470
13.9.3 DMA Space Interface	470
13.9.3.1 Detailed Description	471
13.9.3.2 Typedef Documentation	471
13.9.3.3 Function Documentation	471
13.9.4 Dataspace interface	474
13.9.4.1 Detailed Description	475
13.9.4.2 Enumeration Type Documentation	475
13.9.4.3 Function Documentation	475
13.9.5 Debug interface	479
13.9.5.1 Detailed Description	479
13.9.5.2 Function Documentation	479
13.9.6 Event interface	480
13.9.6.1 Detailed Description	480
13.9.6.2 Function Documentation	480
13.9.7 Initial Environment	483
13.9.7.1 Detailed Description	484
13.9.7.2 Function Documentation	484

13.9.8 Kumem allocator utility . . . . .	488
13.9.9 L4Re Util C Interface . . . . .	488
13.9.10 Log interface . . . . .	488
13.9.10.1 Detailed Description . . . . .	489
13.9.10.2 Function Documentation . . . . .	489
13.9.11 Memory allocator . . . . .	491
13.9.11.1 Detailed Description . . . . .	492
13.9.11.2 Enumeration Type Documentation . . . . .	492
13.9.11.3 Function Documentation . . . . .	492
13.9.12 Namespace interface . . . . .	495
13.9.12.1 Detailed Description . . . . .	496
13.9.12.2 Enumeration Type Documentation . . . . .	496
13.9.12.3 Function Documentation . . . . .	496
13.9.13 Parent interface . . . . .	499
13.9.14 Region map interface . . . . .	499
13.9.14.1 Detailed Description . . . . .	500
13.9.14.2 Enumeration Type Documentation . . . . .	500
13.9.14.3 Function Documentation . . . . .	501
13.9.15 Video API . . . . .	513
13.9.15.1 Detailed Description . . . . .	514
13.9.15.2 Typedef Documentation . . . . .	514
13.9.15.3 Enumeration Type Documentation . . . . .	514
13.9.15.4 Function Documentation . . . . .	515
13.10 L4Re C++ Interface . . . . .	520
13.10.1 Detailed Description . . . . .	522
13.10.2 Auxiliary data . . . . .	522
13.10.2.1 Detailed Description . . . . .	523
13.10.3 C++ Exceptions . . . . .	523
13.10.3.1 Detailed Description . . . . .	524
13.10.4 Console API . . . . .	524
13.10.4.1 Detailed Description . . . . .	524
13.10.5 Debugging API . . . . .	524
13.10.5.1 Detailed Description . . . . .	525
13.10.6 Event API . . . . .	525
13.10.6.1 Detailed Description . . . . .	525
13.10.7 L4Re ELF Auxiliary Information . . . . .	526
13.10.7.1 Detailed Description . . . . .	527
13.10.7.2 Macro Definition Documentation . . . . .	527
13.10.7.3 Enumeration Type Documentation . . . . .	527
13.10.8 L4Re Protocol identifiers . . . . .	528
13.10.8.1 Detailed Description . . . . .	529
13.10.9 L4Re Util C++ Interface . . . . .	529

13.10.9.1 Detailed Description . . . . .	529
13.10.9.2 Kumem utilities . . . . .	530
13.10.9.3 L4Re Capability API . . . . .	531
13.10.10 Logging interface . . . . .	533
13.10.10.1 Detailed Description . . . . .	534
13.10.11 Name-space API . . . . .	534
13.10.11.1 Detailed Description . . . . .	534
13.10.12 Parent API . . . . .	535
13.10.12.1 Detailed Description . . . . .	535
13.10.13 Region map API . . . . .	535
13.10.13.1 Detailed Description . . . . .	536
13.10.14 Vbus API . . . . .	536
13.10.14.1 Detailed Description . . . . .	537
13.11 L4SHM-based ring buffer implementation . . . . .	538
13.11.1 Detailed Description . . . . .	538
13.11.2 Internal . . . . .	538
13.11.2.1 Detailed Description . . . . .	539
13.11.2.2 Macro Definition Documentation . . . . .	539
13.11.3 Receiver . . . . .	540
13.11.4 Sender . . . . .	540
13.12 Server-Side IPC framework . . . . .	540
13.12.1 Detailed Description . . . . .	541
13.12.2 Enumeration Type Documentation . . . . .	542
13.12.2.1 Reply_mode . . . . .	542
13.13 Shared Memory Library . . . . .	542
13.13.1 Detailed Description . . . . .	543
13.13.2 Function Documentation . . . . .	544
13.13.2.1 l4shmc_area_overhead() . . . . .	544
13.13.2.2 l4shmc_area_size() . . . . .	544
13.13.2.3 l4shmc_area_size_free() . . . . .	544
13.13.2.4 l4shmc_attach() . . . . .	545
13.13.2.5 l4shmc_chunk_overhead() . . . . .	545
13.13.2.6 l4shmc_connect_chunk_signal() . . . . .	545
13.13.2.7 l4shmc_create() . . . . .	546
13.13.2.8 l4shmc_get_client_nr() . . . . .	546
13.13.2.9 l4shmc_get_initialized_clients() . . . . .	547
13.13.2.10 l4shmc_mark_client_initialized() . . . . .	547
13.13.3 Chunks . . . . .	548
13.13.3.1 Detailed Description . . . . .	548
13.13.3.2 Function Documentation . . . . .	548
13.13.3.3 Consumer . . . . .	551
13.13.3.4 Producer . . . . .	555

13.13.4 Signals	558
13.13.4.1 Detailed Description	559
13.13.4.2 Function Documentation	559
13.13.4.3 Consumer	562
13.13.4.4 Producer	566
13.14 Sigma0 API	566
13.14.1 Detailed Description	567
13.14.2 Enumeration Type Documentation	568
13.14.2.1 l4sigma0_return_flags_t	568
13.14.3 Function Documentation	568
13.14.3.1 l4sigma0_debug_dump()	568
13.14.3.2 l4sigma0_map_anypage()	568
13.14.3.3 l4sigma0_map_errstr()	569
13.14.3.4 l4sigma0_map_iomem()	569
13.14.3.5 l4sigma0_map_kip()	570
13.14.3.6 l4sigma0_map_mem()	570
13.14.4 Internal constants	571
13.14.4.1 Detailed Description	572
13.15 Small C++ Template Library	572
13.15.1 Detailed Description	574
13.15.2 Function Documentation	574
13.15.2.1 clamp()	574
13.15.2.2 max() [1/2]	574
13.15.2.3 max() [2/2]	574
13.15.2.4 min() [1/2]	575
13.15.2.5 min() [2/2]	575
13.15.2.6 operator new()	576
13.16 Utility Functions	576
13.16.1 Detailed Description	578
13.16.2 Function Documentation	578
13.16.2.1 l4_sleep()	578
13.16.2.2 l4_touch_ro()	579
13.16.2.3 l4_touch_rw()	580
13.16.2.4 l4_usleep()	580

# Chapter 1

## Overview

Welcome to the documentation of the L4Re Operating System Framework, or L4Re for short. There are two parts to this documentation: a user manual, which provides a birds eye view of L4Re and its environment, and a reference section which documents the complete programming API.

### User Manual

1. [Introduction](#) shortly explains the concept of microkernels and introduces the basic terminology.
2. [Tutorial](#) helps you getting started with setting up the development environment and writing your own first L4Re application.
3. [Programming for L4Re](#) explains in detail the most important programming concepts.
4. [L4Re Servers](#) provides a quick overview over standard services running on the L4Re operating system.

### Reference

The second part provides the complete reference of all classes and functions of the L4Re Operating System Framework as well as a list of example code.

# Chapter 2

## Introduction

The intention of this section is to provide a short overview about the [L4Re](#) Operating System Framework.

The general structure of a microkernel-based system will be introduced and the principal functionality of the servers in the basic environment outlined.

### 2.1 L4Re Microkernel

The [L4Re](#) Microkernel is the lowest-level component of software running in an L4Re-based system. The microkernel is the only component that runs in privileged processor mode. It does not include complex services such as program loading, device drivers, or file systems; those are implemented in user-level programs on top of it (a basic set of these services and abstractions is provided by the [L4](#) Runtime Environment).

Microkernel services are implemented in kernel objects. Tasks hold references to kernel objects in their respective *"object space"*, which is a kernel-protected table. These references are called *capabilities*. System calls to the microkernel are function invocations on kernel objects through the corresponding capabilities. These can be thought of as function invocations on object references in an object-oriented programming environment. Furthermore, if a task owns a capability, it may grant other tasks the same (or fewer) rights on this object by passing the capability from its own to the other task's object space.

From a design perspective, capabilities are a concept that enables flexibility in the system structure. A thread that invokes an object through a capability does not need to care about where this object is implemented. In fact, it is possible to implement all objects either in the kernel or in a user-level server and replace one implementation with the other transparently for clients.

#### 2.1.1 Communication

The basic communication mechanism in L4-based systems is called *"Inter Process Communication (IPC)"*. It is always synchronous, i.e. both communication partners need to actively rendezvous for IPC. In addition to transmitting arbitrary data between threads, IPC is also used to resolve hardware exceptions, faults and for virtual memory management.

### 2.1.2 Kernel Objects

The following list gives a short overview of the kernel objects provided by the [L4Re](#) Microkernel:

- **Task** A task comprises a memory address space (represented by the task's page table), an object space (holding the kernel protected capabilities), and on x86 an IO-port address space.
- **Thread** A thread is bound to a task and executes code. Multiple threads can coexist in one task and are scheduled by the microkernel's scheduler.
- **Factory** A factory is used by applications to create new kernel objects. Access to a factory is required to create any new kernel object. Factories can control and restrict object creation.
- **IPC Gate** An IPC gate is used to create a secure communication channel between different tasks. It embeds a label (kernel protected payload) that securely identifies the gate through which a message is received. The gate label is not visible to and cannot be altered by the sender.
- **IRQ** IRQ objects provide access to hardware interrupts. Additionally, programs can create new virtual interrupt objects and trigger them. This allows to implement a signaling mechanism. The receiver cannot decide whether the interrupt is a physical or virtual one.
- **Vcon** Provides access to the in-kernel debugging console (input and output). There is only one such object in the kernel and it is only available, if the kernel is built with debugging enabled. This object is typically interposed through a user-level service or without debugging in the kernel can be completely based on user-level services.
- **Scheduler** Implements scheduling policy and assignment of threads to CPUs, including CPU statistics.

## 2.2 L4Re System Structure

The system has a multi-tier architecture consisting of the following layers depicted in the figure below:

- **Microkernel** The microkernel is the component at the lowest level of the software stack. It is the only piece of software that is running in the privileged mode of the processor.
- **Tasks** Tasks are the basic containers (address spaces) in which system services and applications are executed. They run in the processor's deprivileged user mode.

Figure 2.1 Basic Structure of an L4Re based system

In terms of functionality, the system is structured as follows:

- Microkernel** The kernel provides primitives to execute programs in tasks, to enforce isolation among them, and to provide means of secure communication in order to let them cooperate. As the kernel is the most privileged, security-critical software component in the system, it is a general design goal to make it as small as possible in order to reduce its attack surface. It provides only a minimal set of mechanisms that are necessary to support applications.
- Runtime Environment** The small kernel offers a concise set of interfaces, but these are not necessarily suited for building applications directly on top of it. The [L4Re](#) Runtime Environment aims at providing more convenient abstractions for application development. It comprises low-level software components that interface directly with the microkernel. The root pager *sigma0* and the root task *Moe* are the most basic components of the [L4Re](#) Runtime Environment. Other services (e.g., for device enumeration) use interfaces provided by them.
- Applications** Applications run on top of the system and use services provided by the runtime environment – or by other applications. There may be several types of applications in the system and even virtual machine monitors and device drivers are considered applications in the terminology used in this document. They are running alongside other applications on the system.

Lending terminology from the distributed systems area, applications offering services to other applications are usually called *servers*, whereas applications using those services are named *clients*. Being in both roles is also common, for instance, a file system server may be viewed as a server with respect to clients using the file system, while the server itself may also act as a client of a hard disk driver.

## 2.3 L4Re Runtime Environment

The [L4Re](#) Runtime Environment provides a basic set of services and abstractions, which are useful to implement and run user-level applications on top of the [L4Re](#) Microkernel. They form the [L4Re](#) Operating System Framework.

The [L4Re](#) Operating System Framework consists of a set of libraries and servers. [L4Re](#) follows an object-oriented design. Server interfaces are object-oriented, and the implementation is also object-oriented.

A minimal L4Re-based application needs 3 components to be booted beforehand: the [L4Re](#) Microkernel, the root pager (Sigma0), and the root task (Moe). The Sigma0 root pager initially owns all system resources, but is usually used only to resolve page faults for the Moe root task. Moe provides the essential services to normal user applications such as an initial program loader, a region-map service for virtual memory management, and a memory (data space) allocator.

# Chapter 3

## Tutorial

This tutorial assumes that the reader is familiar with the basic L4 concepts that were discussed in the [Introduction](#) section.

Here you can find the first steps to boot a very simple setup. The setup consists of the following components:

- [L4Re](#) Microkernel
- Sigma0 — Root Pager
- Moe — Root Task
- Ned — Init Process
- hello — The classical 'Hello World' Application

The guide assumes that you already compiled the base components and describes how to generate an ISO image, with GRUB as a boot loader, that can for example be booted within QEMU.

First you need a `modules.list` file that contains an entry for the scenario.

```
modaddr 0x002000000

entry hello
  kernel fiasco -serial_esc
  roottask moe rom/hello.cfg
  module l4re
  module ned
  module hello.cfg
  module hello
```

This file describes all the binaries and scripts to put into the ISO image, and also describes the GRUB `menu.lst` contents. What you need to do is to set the `make` variable `MODULE_SEARCH_PATH` to contain the path to your [L4Re](#) Microkernel's build directory and the directory containing your `hello.cfg` script.

The `hello.cfg` script should look like the following. A ready to use version can be found in `l4/conf/examples`.

```
local L4 = require("L4");
L4.default_loader:start({}, "rom/hello");
```

The first line of this script ensures that the [L4](#) package is available for the script. The second line uses the default loader object defined in that package and starts the binary `rom/hello`.

### Note

All modules defined in `modules.list` are available as data spaces ([L4Re::Dataspace](#)) and registered in a name space ([L4Re::Namespace](#)). This name space is in turn available as 'rom' to the init process ([Ned](#)).

Now you can go to your [L4Re](#) build directory and run the following command.

**Note**

The example assumes that you have created the `modules.list` and `hello.cfg` files in the `/tmp` directory. Adapt if you created them somewhere else.

```
make grub2iso E=hello MODULES_LIST=/tmp/modules.list MODULE_SEARCH_PATH=/tmp:<path_to_fiasco_builddir>
```

Now you should be able to boot the image in QEMU by running:

```
qemu-system-x86_64 -m 1024 -cdrom images/hello.iso -serial stdio
```

If you press `<ESC>` in the terminal that shows you the serial output you enter the microkernel's debugger... Have fun.

## 3.1 Customizations

A basic set of bootable entries can be found in `l4/conf/modules.list`. This file is the default for any image creation as shown above. It is recommended that local modification regarding image creation are done in `conf/Makeconf.boot`. Initially you may copy `Makeconf.boot.example` to `Makeconf.boot`. You can overwrite `MODULES_LIST` to set your own modules-list file. Set `MODULE_SEARCH_PATH` to your setup according to the examples given in the file. When configured a `make` call is reduced to:

```
make grub2iso E=hello
```

All other local configuration can be done in a `Makeconf.local` file located in the `l4` directory.

## Chapter 4

# Programming for L4Re

This part of the documentation discusses the concept of microkernel-based programming in more detail.

You should already have a basic understanding of the [L4Re](#) programming environment from the tutorial.

- [L4 Inter-Process Communication \(IPC\)](#)
- [Capabilities and Naming](#)
- [Spaces and Mappings](#)
- [Initial Environment and Application Bootstrapping](#)
- [Memory management - Data Spaces and the Region Map](#)
- [Program Input and Output](#)
- [Initial Memory Allocator and Factory](#)
- [Application and Server Building Blocks](#)
- [Pthread Support](#)
- tasks and threads
- communication channels
- server loops
- [Interface Definition Language](#)
- hardware access
- [L4Re Build System](#)
- [Kernel Factory](#)

### 4.1 L4 Inter-Process Communication (IPC)

Inter-process communication (IPC) is the fundamental communication mechanism in the [L4Re](#) Microkernel.

Basically IPC invokes a subroutine in a different context using input and output parameters. It is used to communicate between userland threads and, as a special case, to communicate between a userland thread and a kernel object. IPC provides the only (non-debugging) way of doing system calls.

### 4.1.1 IPC mechanism

When using this API, an IPC operation can be conducted using the `l4_ipc()` function (or one of its related [helpers](#)). In general it causes a method to be invoked on the called kernel object. An IPC operation consists of a send and receive phase, but either of them can be skipped, that is, an IPC operation can consist of only either a send or a receive phase. IPC is always synchronous and blocking and can be given a timeout. Timeouts can be specified separately for each phase. Invoking the IPC syscall without any phase is deprecated.

On the lowest abstraction level, IPC operations need the following arguments:

- [flags](#) describing the IPC mode,
- the [capability selector](#) of the communication partner,
- a [label](#),
- a [message tag](#), and
- a pair of [timeout](#) values.

During an IPC operation the kernel accesses the UTCB of the current thread to read parameters which are not passed as direct arguments.

As result of an IPC operation the kernel returns a message tag and a label and the kernel also changes UTCB content. For the detailed call signature, refer to `l4_ipc()`. Furthermore, depending on the IPC parameters, the kernel might have transferred the FPU state and capabilities (memory, I/O ports, and/or object capabilities) from the sender to the receiving thread.

The transition between the IPC send phase and the IPC receive phase is atomic, that is, as soon as the send phase has finished, the thread receive phase starts. A relative receive timeout does not start before the send phase has finished (see also below) and a thread which received an IPC call from another thread can assume that the other thread is ready to receive the reply message and the replying thread can therefore reply with a timeout of zero, see [IPC Timeouts](#).

For performance optimization and under certain conditions, the kernel may perform a context switch from the IPC sender to the IPC receiver without consulting the scheduler after the send phase finished. For instance, a client performing an IPC call to a server has to wait for the server anyway. Hence, after the client request was sent to the server, the kernel switches directly to the server thread. This behavior can be disabled by setting the `L4_MSGTAG_SCHEDULE` flag in the sender message tag (see below).

#### 4.1.1.1 IPC Flags

The *flags* defined in `l4_syscall_flags_t` are used by the invoking thread to define the intended IPC operation. The variants of `l4_ipc()` (see [Object Invocation](#)) use the flags

- to request the IPC phases (send-only IPC, receive-only IPC, IPC with send and receive phase), and
- to decide, if the reply capability (see [below](#)) should be used instead of the capability of a dedicated kernel object as target for the send phase (*reply*), and
- to decide, if receiving should wait for an incoming message from any possible sender (*open wait*) instead of a message from a dedicated sender (*closed wait*).

#### 4.1.1.2 Partner capability selector

The *partner capability selector* defines a kernel object as partner of the IPC operation. Some kernel objects forward IPC to a userland thread.

Basically an object capability is represented by `l4_cap_idx_t` where the bits starting from `L4_CAP_SHIFT` are used as index into the local capability table of the current address space.

Specifying `L4_INVALID_CAP` as target for an IPC operation is equivalent to specifying a thread capability of the current thread with full permissions. As a result, the userland thread either communicates with its corresponding kernel thread object (if `L4_PROTO_THREAD` is specified as protocol value, see the description of the message tag below) or the IPC target is the current userland thread. In the latter case, no IPC will be performed and the send phase and the receive phase will block until the corresponding timeout has expired, see below.

A special partner is defined by the *reply capability*. Since it would be impractical (and a security flaw) to always pass an explicit object capability to reply to for each IPC, the kernel generates an implicit one that can be used for just that purpose if the IPC contains an **open wait** phase. The reply capability is valid after a receive phase and points to the kernel object that sent the IPC just received. It can be used only once. The reply capability is selected by setting the `L4_SYSF_REPLY` flag, see above.

#### 4.1.1.3 IPC Label

The IPC label is a machine word which is transferred unchanged from the IPC sender to the IPC receiver when directly sending to a userland thread. However, the primary purpose of the label is to create a relationship between an `L4::Rcv_endpoint` (`L4::lpc_gate` or `L4::lrq`) and the bound thread.

During `L4::Rcv_endpoint::bind_thread()`, a label is specified. If the thread receives an IPC message through the endpoint, that label is delivered to the receiving thread as output parameter of `l4_ipc()` instead of the label specified during the corresponding IPC send operation (see the detailed description of `L4::lpc_gate` for more details on the label with IPC gates). The label is usually used by the receiving thread to invoke the object which is responsible for handling the IPC request of the corresponding endpoint. This mechanism is used by the `L4::Epiface` mechanism for server loops.

#### 4.1.1.4 IPC Message Tag

The *message tag* (`l4_msgtag_t`) describes the payload of the IPC and can also be used to enable certain features. It contains:

- a *protocol value* (cf. `l4_msgtag_t::label()`, also called the tag's *label*),
- the number of items in *UTCB message registers* to transfer (cg. `l4_msgtag_t::words()` and `l4_msgtag_t::items()`), and
- flags (cf. `l4_msgtag_t::flags()` and `L4_msgtag_flags`, may be 0).

The information from the message tag is required by the kernel to transfer the message. The IPC system call returns a message tag as result of the IPC operation. On success, a copy of the message tag specified by the sender is returned if there is a receive phase. Without receive phase, a successful IPC syscall returns the message tag specified as input parameter.

Failures during IPC are signalled using the `L4_MSGTAG_ERROR` flag in the message tag. If this bit is set by the kernel, the content of the returned message tag apart from that bit is undefined and the kernel wrote the actual error code into the `l4_thread_regs_t::error` register of the UTCB (see also *IPC Thread Control Registers*). When an IPC error occurs after the rendezvous of the IPC partners, both partners observe the same error information. If, for

instance, the IPC was aborted using `L4::Thread::ex_regs()`, the sender gets an `L4_IPC_SECANCELED` error while the receiver gets an `L4_IPC_RECANCELED` error. The function `L4Re::chkipc()` can be used to verify that an IPC operation finished successfully: It throws an error if the IPC failed.

The *protocol value* is usually used to distinguish between different protocols of the same interface. Certain protocol IDs are pre-defined when talking to kernel objects, see `L4_msgtag_protocol`. From IPC point of view, the protocol value is just payload that is transferred from sender to receiver and hence doesn't have a dedicated meaning.

By convention, during IPC calls, the protocol value is used for return values, where negative values signify errors. See the [section](#) about L4 RPC return types for further information. The function `L4Re::chksys()` can be used to verify that an RPC call using IPC was successful: It throws an error if the IPC failed or if the returned protocol value is negative.

#### 4.1.1.5 IPC Timeouts

As written above, IPC *timeouts* are specified separately for the send phase (IPC send timeout) and the receive phase (IPC receive timeout). The timeout of one phase is encapsulated by `l4_timeout_s`. Both timeouts are combined into a single `l4_timeout_t` parameter. Timeouts are either relative to the current time of the invoking thread or absolute. In the latter case, the absolute time of the deadline of the respective phase is written into a UTCB buffer register (see `l4_timeout_abs()`). The relative timeout of the receive phase starts immediately after the send phase has finished.

Two specific timeout values are sufficient for most IPC operations:

- `L4_IPC_TIMEOUT_NEVER` is used if the IPC partner might not yet be ready. Usually a client trusting a server will perform an IPC call with an infinite timeout for both phases. The send phase will take some time if the IPC receiver is currently not ready. The receive phase will take some time as the server needs time to serve the request. Also, a server will usually wait with an infinite receive timeout for the next request (see below for a possible exception).
- `L4_IPC_TIMEOUT_0` is used when it is either certain that the IPC receiver is currently ready or if the IPC sender doesn't want to wait if the IPC receiver is not ready. The former case applies to a thread which was called with an IPC call, for example a server got a client request. The reply to the IPC call should use a timeout of zero to ensure that a client doesn't block a server (server could not deliver the result of the request). See also `L4::ipc_srv::Default_timeout`. Another case is an IPC send operation for waking up another thread from an IPC receive operation. If the other thread is not ready to receive, then it might be already woken up and it does not make sense to wait any longer. Also triggering an IRQ is usually done with a send timeout of 0, see `L4::Triggerable::trigger()`.

In certain cases it also makes sense to specify an IPC timeout different from "never" or "zero":

- A server might leave the server loop after some time to perform idle work (see `L4::ipc_srv::Server_iface::add_timeout()`).
- A thread does not want to wait for an infinite time if the partner is not ready. This could be also some safety measure.
- A thread wants to block for a certain amount of time without consuming CPU time. The `l4_ipc_sleep()` function specifies the `L4_INVALID_CAP` as target for an IPC receive operation and specifies the intended relative waiting period as IPC timeout. Waiting for an absolute timeout would be possible with similar code.

#### Note

The kernel IPC path is optimized for the two special cases using `L4_IPC_TIMEOUT_NEVER` and `L4_IPC_TIMEOUT_0`. Specifying a different timeout causes more maintenance effort for the kernel.

Special care is required if a finite timeout for the receive phase of an IPC call is specified: The IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

#### 4.1.1.6 User-level Thread Control Block

The **UTCB** is located on a power-of-2-sized and power-of-2-aligned memory area shared between userland and the kernel (`L4::Task::add_ku_mem()`). The UTCB is bound to a thread during the `L4::Thread::control()` operation with the `L4::Thread::Attr` parameters set up using `L4::Thread::Attr::bind()`. The UTCB is used for IPC-related data exchange and is set up before invoking `l4_ipc()`. To access certain parts of the UTCB, the corresponding functions have to be used (there is no data type `L4_utcb` or similar). The UTCB consists of:

- the **message registers** `MR[0]`, `MR[1]`, ..., `MR[n-1]` with  $n = \text{L4\_UTCB\_GENERIC\_DATA\_SIZE}$  (access using `l4_utcb_mr()`),
- the **buffer descriptor register** `BDR` (access using `l4_utcb_br()`, see `l4_buf_regs_t::bdr`),
- the **buffer registers** `BR[0]`, `BR[1]`, ..., `BR[m-1]` with  $m = \text{L4\_UTCB\_GENERIC\_BUFFERS\_SIZE}$  (access using `l4_utcb_br()`),
- the **thread control registers** (access using `l4_utcb_tcr()`, includes the IPC error code), and
- in case of an exception IPC, the register state of the thread which triggered the exception (access using `l4_utcb_exc()`).

IPC to a kernel object requires the setup of the UTCB of the corresponding userlevel thread. IPC between userlevel threads requires the setup of UTCBs of both partners.

The kernel changes only the following UTCB content:

- The message registers of the UTCB of the receiver of an IPC, and
- the IPC error field of the thread invoking `l4_ipc()` if there was an error during IPC.

##### 4.1.1.6.1 IPC Message registers

The *message registers* contain *untyped items* and *typed items*. The sender's typed items are interpreted by the kernel in conjunction with the receiver's *receive items*. Each typed send item occupies two message registers. The untyped items, on the other hand, are free to be used by the communication partners to exchange data: The content of all message registers used for untyped items (`l4_msgtag_t::words()`) is copied from the UTCB of the IPC sender to the UTCB of the IPC receiver.

A typed send item consists of a *flexpage* (see `l4_fpage()`, `l4_obj_fpage()`, and `l4_iofpage()`) of the to be transferred capabilities (*flexpage word*) and a *message word*. There are two types of send items: *map items* and *void items*. For a void item, the message word is all zero. For a map item, the message word contains:

- the *compound bit* allowing to use the same receive buffer for the subsequent typed send item (scatter-gather behavior, see `L4_ITEM_CONT` of `l4_msg_item_consts_t`),
- the *type bit* defining this typed send item as a *map item*,
- the *grant flag* for delegating the access to the flexpage from the sender to the receiver and atomically removing the rights from the sender (see `l4_msg_item_consts_t`),
- *attributes* with semantics depending on the item type; for memory mappings, they contain cacheability information (see `l4_fpage_cacheability_opt_t`); for objects, they contain additional rights (see `L4_obj_fpage_ctl`),
- the *send base* (also called *hot spot*) defining what is actually mapped when send and receive flexpages have a different size.

A typed send item can be created using `l4_sndfpage_add()`. This function sets the compound bit unconditionally. Alternatively, the functions `l4_map_control()` and `l4_map_obj_control()` can be used to set up the message word of a map item for a memory flexpage respective for objects.

See [below](#) for a description how typed items are transferred.

#### 4.1.1.6.2 IPC Buffer Registers

The *buffer registers* and *buffer descriptor register* are interpreted by the kernel during the receive phase (if any). Buffer registers define *receive items* which are required to receive typed send items (memory, I/O ports or object capabilities). To specify a receive item, either one or two buffer registers are required:

- A *small buffer item* ([L4::lpc::Small\\_buf](#)) occupying one buffer register is sufficient to receive one object capability.
- A *buffer item* ([L4::lpc::Buf\\_item](#)) occupying two buffer registers (*message word* and a *flexpage*) is required to receive memory flexpages, I/O ports, or multiple object capabilities.

#### 4.1.1.6.3 IPC Buffer Descriptor Register

The buffer descriptor register defines indices of buffer registers used to receive dedicated types of send items and also contains a flag:

- 5 bits starting at [L4\\_BDR\\_MEM\\_SHIFT](#) define the index of the first receive item used for memory flexpages.
- 5 bits starting at [L4\\_BDR\\_IO\\_SHIFT](#) define the index of the first receive item used for I/O flexpages.
- 5 bits starting at [L4\\_BDR\\_OBJ\\_SHIFT](#) define the index of the first receive item used for object flexpages.
- The [L4\\_UTCB\\_INHERIT\\_FPU](#) can be set using [l4\\_utcb\\_inherit\\_fpu\(\)](#) and allows to receive the FPU state from the IPC sender. This is only relevant if the sender set [L4\\_MSGTAG\\_TRANSFER\\_FPU](#) in the message tag.

For most use cases, a BDR value of zero is sufficient. In that case, if `BR[0]` contains a void item, no capabilities are received. Otherwise, only one type of capabilities (memory, I/O ports or objects) can be received even if there are several receive items. For more complex setups that require receiving different types of capabilities in one receive operation, other BDR values are necessary.

The BDR of the receiving thread is only used by the kernel if at least one typed item is transferred during the IPC or if [L4\\_MSGTAG\\_TRANSFER\\_FPU](#) is set in the UTCB of the sending thread.

#### 4.1.1.6.4 IPC Thread Control Registers

The [l4\\_thread\\_regs\\_t::error](#) register contains the IPC error code in case the [L4\\_MSGTAG\\_ERROR](#) flag is set in the message tag returned by an IPC syscall. Otherwise this register is not touched by the kernel. See [l4\\_ipc\\_tcr\\_error\\_t](#) for a detailed enumeration of all possible error codes during an IPC operation.

The other members of [l4\\_thread\\_regs\\_t](#) are never touched by the kernel.

#### 4.1.1.7 Transfer of Typed Send Items

The kernel interprets all typed items in the sender UTCB ([l4\\_msgtag\\_t::items\(\)](#)) and performs the following operations while modifying the corresponding typed items in the receiver UTCB:

- If the message item of the sender is void, this item is ignored and the message word of the corresponding typed item in the receiver UTCB is set to zero (making it a void item). The flexpage word of this item is not changed.
- Otherwise, if the type bit of the message item of the sender is not set, the IPC is aborted with [L4\\_IPC\\_SEMSGCUT](#) / [L4\\_IPC\\_REMSGCUT](#).
- Otherwise, if there is a receive item corresponding to the flexpage type of the send item available (see [IPC Buffer Descriptor Register](#)), information described by the flexpage is transferred to the receiver.

In the last case, the message word of the typed item in the receiver UTCB is modified to contain the send base, the type and the size of the transferred flexpage, as well as a copy of the compound bit and the type bit of the send item. If the receiver ordered a local ID in the corresponding receive item, the kernel attempts to apply special rules, see [L4\\_RCV\\_ITEM\\_LOCAL\\_ID](#). Otherwise, regular mappings as described by the flexpage of the send item are created in the receiver space.

A receive item forms a *receive window* of a specific address and size in the receiver space. Each typed send item that is a map item requires a corresponding receive item. By default, there is a one-to-one mapping (one receive item per typed send item) but it is also possible to use one receive item to receive several typed send items: The compound bit (see [l4\\_msg\\_item\\_consts\\_t](#)) of a send item defines if the following typed send item shall use the same receive item as the current one for receiving the flexpage. If the compound bit is set, proper values of the send base shall be used to prevent overlapping of addresses in the receiver space.

The send base is relevant when the size of the receive flexpage differs from the size of the transferred resource. As a typical example, triggering a memory page fault opens a receive window covering the entire memory address space of the faulting thread. The pager will usually reply a memory flexpage smaller than the entire address space of the faulting thread. Hence, the pager has to specify a proper base which is used as offset of the sent object in the receive flexpage in the *receiver space*. If the sender flexpage is bigger than the receive window, a flexpage of the size of the receive window starting at the send base in the *sender space* is transferred to the receiver.

The kernel will stop transmission of typed items before [l4\\_msgtag\\_t::items\(\)](#) is reached either if it finds a void item as receive buffer or if the flexpage type of the send item does not match the flexpage type of the corresponding receive item. Under both conditions, the IPC is aborted with [L4\\_IPC\\_SEMSGCUT](#) / [L4\\_IPC\\_REMSGCUT](#).

#### Note

The kernel ignores the flexpage access rights of the receive items. The actual rights for a transferred resource in the target address space are defined by the access rights to that resource of the IPC sender address space and the flexpage access rights in the typed send item. Additionally, when transferring object capabilities, the transferred rights also depend on the sender's rights on the capability invoked for IPC.

The kernel does not unmap capabilities in the receive window when there is no capability present at the corresponding index at the sender. Further, the receiver cannot reliably detect at which capability indices it received capabilities in its receive windows. Therefore, before receiving from an untrusted source, all receive windows should be cleared. Otherwise the receiver may erroneously associate a capability in one of its receive windows with his last IPC partner although it was actually received in an earlier IPC.

However, the kernel indicates if at least one object capability was received or not, see [L4::lpc::Gen\\_fpage::cap\\_received\(\)](#).

## 4.1.2 Examples

A number of examples show the interplay of the concepts introduced so far.

#### 4.1.2.1 User Thread to Kernel Object

The `L4::Scheduler` kernel object has a method `L4::Scheduler.idle_time()`. It takes a set of CPUs to query, represented by two machine words.

In user space, the function `L4::Cap<L4::Scheduler>->idle_time()` is called, which does the following:

- Fill `MR[0]` with a constant identifying the method being called (`L4_SCHEDULER_IDLE_TIME_OP`).
- Fill `MR[1]` and `MR[2]` with the two words making up the CPU set.
- Set up the message tag with the protocol value (`L4_PROTO_SCHEDULER`), the number of untyped and typed items (3 and 0), and some flags.
- Call `l4_ipc()` with the partner capability ID, the tag, the pointer to the filled UTCB, infinite timeouts, and with flags indicating a send and receive phase. (The label does not matter in this case.)

This function traps into kernel space using standard platform specific mechanisms. The kernel reads the protocol value on the message tag, checks that the partner capability ID refers to a valid object that speaks that protocol, and dispatches the message to the appropriate handler. The handler fills the first 64 bits of the message registers with the computed time value. This will cover `MR[0]` on 64-bit architectures and `MR[0]` and `MR[1]` on 32-bit architectures. It then sets up the return message tag:

- The number of untyped items is 1 or 2.
- The number of typed items is 0.
- The protocol value contains the return value and is set to 0.
- An error would be signalled as a negative protocol value. Under certain conditions (e.g. wrong kernel object capability specified), the error is signalled as IPC error (see `L4_MSGTAG_ERROR` in the description of the `IPC Message Tag`).
- (The return label is as irrelevant in this case as the send label.)

This reply is received by the receive phase of the original `l4_ipc()` call from userland. Finally the `l4_ipc()` function copies the time value out of the message registers and forwards it with a possible error from the message tag flags to its caller.

#### 4.1.2.2 User Thread to User Thread

When the target kernel object is of type `L4::Thread` (or `L4::ipc_gate`, but we will cover this in the example below) and the message tag's protocol value is not `L4_PROTO_THREAD`, the kernel will forward the IPC message to the userland thread represented by the kernel object. There it can be received by a call to `l4_ipc()`. The restriction of the protocol number is necessary because one also wants to invoke `L4::Thread`'s control methods such as `L4::Thread.switch_to()` or `L4::Thread.ex_regs()`. Besides this restriction, the interpretation of all the IPC parameters and the untyped items of the UTCB is up to the communication partners.

#### 4.1.2.2.1 Simple Messages

A simple example is a client calling a server to have a computation performed on a value: Similar to IPC from a userland thread to a kernel object, the client writes the value to `MR[0]`. It sets up the message tag with some agreed upon protocol value (which, as explained above, must be different from `L4_PROTO_THREAD`), number of untyped items to 1, typed items to 0, and no flags set. The client may want to pass a label that identifies itself, as many clients can use the server. In this context, the identifier might also be passed via the message registers, but the label is the proper place for this, as it gets a special treatment by the kernel for IPC gates (covered by the example below). The client then calls `l4_ipc()` with the tag, label and flags indicating it wants a send phase and a receive phase (as it wants a result back). The target is the capability index referring to a capability for the `L4::Thread` kernel object of the server.

To be able to receive an IPC message, the server has set up a UTCB of its own and called `l4_ipc()` with flags indicating it only wants to enter a receive phase and it accepts IPCs from any partner. This is called an **open wait**. (The alternative would be to specify a capability index referring to a `L4::Thread` capability to exclusively receive from.)

Both system calls (the send IPC initiated by the client and the receive IPC initiated by the server) may be seen by the kernel in any order but the IPC will not start before sender and receiver are ready. In that case the kernel will copy the relevant message registers the client specified in the message tag from the client's UTCB to the server's UTCB, in the current example just `MR[0]`. It will then switch the client to the receive phase of its call (which cannot yet be executed) and return the server's call with the message tag and label.

The server inspects the tag for the correct protocol value and number of untyped items passed, inspect the label to decide whether it maybe wants special treatment of this particular client, performs the computation on `MR[0]` and writes the result back to `MR[0]` (or to more words, depending on what exactly it computes). It sets up the tag in the usual way, but probably needs to pass no label, as the client knows who it is talking to.

For the reply, the server makes use the reply capability (see above). Since the client sent the last IPC to the server, the reply capability will point to it. So when the server calls `l4_ipc()` with the computed result in the message registers and using the reply capability as target, the kernel knows to forward this to the client's thread. The kernel copies the message registers from the server's UTCB to the client's UTCB, and the client's `l4_ipc()` system call, which is still stuck in the receive phase, is returned with the tag.

The client looks at the tag and then the message registers for its wanted result and the example is concluded.

#### 4.1.2.2.2 Send Items

IPC between userland threads is also used to transfer typed items: Memory, I/O ports, and objects, all represented as flexpages. Typed items and untyped items can be part of the same IPC. As general rule, the sender specifies what he wants to send, the receiver where and how much it wants to receive, and the kernel checks the required permissions before doing the actual transfer. As written before, this mechanism is synchronous and the receiver cannot be transferred items against its will.

See also

[Flex pages](#)

Suppose a client wants a server to have read only access to a page of its memory. The client sets up a flexpage covering the page and with only the `L4_FPAGE_RO` right set. The server sets up a flexpage of a memory region where it will receive the mapping. This may be larger than one page, suppose for our case four pages, in which case the exact position of the mapping will be resolved by the send base provided by the sender. The client combines the hot spot and some flags into a machine word and writes it to `MR[0]` (see also `l4_map_control()`). At `MR[1]` follows the flexpage it wants to send (see also `l4_fpage()`). The server does almost the same but writes the words to `BR[0]` and `BR[1]`. (The server could also specify a hot spot, but it is currently ignored by the kernel.) The

client specifies 1 typed and 0 untyped items in the message tag. The server writes 0 to `BDR` to specify that the first receive item starts at the first buffer register.

Both client and server initiate their IPC, the client with only a send phase to the server, and the server with an open wait receive phase. The kernel checks the compatibility of the send items and the receive buffers (e.g. that no object capability flexpage is sent to a receive buffer describing a memory mapping flexpage) and updates its internal structures to reflect the change. In our case, the sender's hot spot indicates to which of the four pages that make up the receive buffer the sent page should be mapped. The kernel also translates the typed send item to the server's address space and stores it in the server's UTCB at `MR[0]` and `MR[1]`.

Once the server returns from its syscall, it will have read access to the client's shared page.

#### 4.1.2.3 User Thread to User Object

A common use case for thread to thread communication is when a server implements a number of object interfaces and a client wants to invoke methods on them. For security reasons, the server does not want to hand out its thread capability to everyone it nonetheless wants to serve. It also may not want to allow every client access to everyone of its interfaces. For this purpose, IPC gates implemented by the kernel object `L4::ipc_gate` can be used. An IPC gate can be bound to a thread and forwards IPC to it. In doing so it applies two transformations

1. It sets the label to a predefined value.
2. It changes the rights of transferred items (see `L4_CAP_FPAGE_S`).

For each object of every interface the server implements, it creates an IPC gate and binds it to itself (see `L4::ipc_gate::bind_thread()`). It sets the gate's label to a unique value identifying the object. Then it hands the gate out to clients. Several clients can be handed the same gate and will all end up invoking methods on the same object.

Instead of setting the target as the server's thread kernel object, the client uses the IPC gate's instead. The label the client sends is irrelevant, as the gate will overwrite it with the value the server has set during the bind operation. The server executes an open wait, and the kernel performs the same operation as in the above [example](#) with the transformed IPC finally ending up in the server's thread.

The server checks that the received label refers to one of its objects. It then checks if the protocol value in the message tag matches the interface the object implements. Then it invokes the method specified in `MR[0]` with the rest of the arguments. Finally it returns the results via UTCB and message tag to the reply capability and waits for the next IPC.

## 4.2 Capabilities and Naming

The [L4Re](#) system is a capability based system which uses and offers capabilities to implement fine-grained access control.

Generally, owning a capability means to be allowed to communicate with the object the capability points to. All user-visible kernel objects, such as tasks, threads, and IRQs, can only be accessed through a capability. Please refer to the [Kernel Objects](#) documentation for details. Capabilities are stored in per-task capability tables (the object space) and are referenced by capability selectors or object flex pages. In a simplified view, a capability selector is a natural number indexing into the capability table of the current task.

As a matter of fact, a system designed solely based on capabilities uses so-called 'local names' because each task can only access those objects made available to this task. Other objects are not visible to and accessible by the task.

Figure 4.1 Capabilities and Local Naming in L4

So how does an application get access to a service? In general all applications are started with an initial set of available objects. This set of objects is predetermined by the creator of a new application process and granted directly to the new task before starting the first application thread. The application can then use these initial objects to request access to further objects or to transfer capabilities to its own objects to other applications. A central [L4Re](#) object for exchanging capabilities at runtime is the name-space object, implementing a store of named capabilities.

From a security perspective, the set of initial capabilities (access rights to objects) completely define the execution environment of an application. Mandatory security policies can be defined by well known properties of the initial objects and carefully handled access rights to them.

## 4.3 Spaces and Mappings

Each task in the [L4Re](#) system has access to two resource spaces (three on IA32) which are maintained by the kernel.

These are the

1. object space,
2. memory space, and
3. IO-port space (only on IA32).

The entities addressed in each space are capabilities to objects, virtual memory pages, and IO ports. The addresses are unsigned integers and the largest valid address depends on which space is referenced, the hardware, and the configuration of the kernel. Although a program can access memory at byte granularity, from the kernel's point of view the address granularity in the memory space is not bytes but pages, as determined by the hardware. The address of a capability is also called its "capability slot".

Flexpages describe a range in any of the spaces that has a power-of-two length and is also aligned to this length. They additionally hold access rights information and further space specific information.

When a resource is present at some address in a task's corresponding resource space, then we say that resource is mapped to that task. For example, a capability to the task's main thread may be mapped to capability slot 5, or the first page of the code segment a thread executes is mapped to virtual memory page 12345. However, there need not be any resource mapped to an address.

Tasks can exchange resources through a process called "mapping" during IPC and using the [L4::Task::map\(\)](#) method. The sending task specifies a send flexpage and the receiving task a receive flexpage. The resources mapped to the send flexpage will then be mapped to the receive flexpage by the kernel.

Memory mappings and IO port mappings are hierarchical: If a resource of such a type is subject of a map operation, the received mapping is a child mapping of the corresponding mapping in the sending task (parent mapping). The kernel usually respects the relationship between these two mappings (granting is an exception; see below): If rights of a parent mapping are revoked using [L4::Task::unmap\(\)](#), these rights are also removed from its child mappings. Also, if a mapping is completely removed (via [L4::Task::unmap\(\)](#) or by mapping something else at its place), then also all child mappings are removed. In contrast, revoking rights of a child mapping leaves the rights of its parent mapping untouched.

The mapping of a resource can be performed as *grant* operation (see [L4\\_MAP\\_ITEM\\_GRANT](#)): Such an operation includes the removal of all involved mappings from the send flexpage (basically a move operation). While with a map operation without grant the mapping in the send flexpage remains the parent of all child mappings (including the new child mapping in the receive flexpage), a grant operation moves the mappings covered by the send flexpage to the corresponding addresses from the receive flexpage while leaving the parent/child relationship of the moved mappings with other mappings untouched.

During a map operation at most the access rights of the source mapping(s) can be transferred but no additional rights can be added. So only rights that are present in the source mapping and that are specified in the send item/flexpage are transferred. This also holds for grant mappings, however, rights revocation is *not* guaranteed to be applied to descendant mappings in case of grant.

There are cases where a grant operation is not or cannot be performed as requested; see [L4\\_MAP\\_ITEM\\_GRANT](#) for details.

Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task.

## 4.4 Initial Environment and Application Bootstrapping

New applications that are started by a loader conforming to [L4Re](#) get provided an [Initial Environment](#).

This environment comprises a set of capabilities to initial [L4Re](#) objects that are required to bootstrap and run this application. These capabilities include:

- A capability to an initial memory allocator for obtaining memory in the form of data spaces
- A capability to a factory which can be used to create additional kernel objects
- A capability to a Vcon object for debugging output and maybe input

- A set of named capabilities to application specific objects

During the bootstrapping of the application, the loader establishes data spaces for each individual region in the ELF binary. These include data spaces for the code and data sections, and a data space backed with RAM for the stack of the program's first thread.

One loader implementation is the `moe` root task. Moe usually starts an *init* process that is responsible for coordinating the further boot process. The default *init* process is `ned`, which implements a script-based configuration and startup of other processes. Ned uses Lua (<http://www.lua.org>) as its scripting language, see [Ned Script example](#) for more details.

#### 4.4.1 Configuring an application before startup

The default [L4Re](#) init process (Ned) provides a Lua script based configuration of initial capabilities and application startup. Ned itself also has a set of initial objects available that can be used to create the environment for an application. The most important object is a kernel object factory that allows creation of kernel objects such as IPC gates (communication channels), tasks, threads, etc. Ned uses Lua tables (associative arrays) to represent sets of capabilities that shall be granted to application processes.

```
local caps = {
    name = some_capability
}
```

The [L4](#) Lua package in Ned also has support functions to create application tasks, region-map objects, etc. to start an ELF binary in a new task. The package also contains Lua bindings for basic [L4Re](#) objects, for example, to generic factory objects, which are used to create kernel objects and also user-level objects provided by user-level servers.

```
L4.default_loader:start({ caps = { some_service = service } }, "rom/program --arg");
```

#### 4.4.2 Connecting clients and servers

In general, a connection between a client and a server is represented by a communication channel (IPC gate) that is available to both of them. You can see the simplest connection between a client and a server in the following example.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel(); -- create an IPC gate
loader:start({ caps = { service = svc:svr() } }, "rom/my_server");
loader:start({ caps = { service = svc:m("rw") } }, "rom/my_client");
```

As you can see in the snippet, the first action is to create a new channel (IPC gate) using `loader:new_channel()`. The capability to the gate is stored in the variable `svc`. Then the binary `my_server` is started in a new task, and full (`:svr()`) access to the IPC gate is granted to the server as initial object. The gate is accessible to the server application as "service" in the set of its initial capabilities. Virtually in parallel a second task, running the client application, is started and also given access to the IPC gate with less rights (`:m("rw")`, note, this is essential). The server can now receive messages via the IPC gate and provide some service and the client can call operations on the IPC gate to communicate with the server.

Services that keep client specific state need to implement per-client server objects. Usually it is the responsibility of some authority (e.g., Ned) to request such an object from the service via a generic factory object that the service provides initially.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel():m("rws"); -- create an IPC gate with rws rights
loader:start({ caps = { service = svc:svr() } }, "rom/my-service");
loader:start({ caps = { foo_service = svc:create(object_to_create, "param") } }, "rom/client");
```

This example is quite similar to the first one, however, the difference is that Ned itself calls the `create` method on the factory object provided by the server and passes the returned capability of that request as "foo\_service" to the client process.

#### Note

The `svc:create(...)` call blocks on the server. This means the script execution blocks until the my-service application handles the create request.

## 4.5 Memory management - Data Spaces and the Region Map

### 4.5.1 User-level paging

Memory management in L4-based systems is done by user-level applications, the role is usually called *pager*. Tasks can give other tasks full or restricted access rights to parts of their own memory. The kernel offers means to give access to memory in a secure way, often referred to as *memory mapping*.

The mapping mechanism allows one task to resolve page faults of another: A thread usually has a pager assigned to it. When the thread causes a page fault, the kernel sends an IPC message to the pager with information about the page fault. The pager answers this IPC by either providing a backing page, or with an error. The kernel will map the backing page into the address space of the faulting thread's task.

These mechanisms can be used to construct a memory and paging hierarchy among tasks. The root of the hierarchy is `sigma0`, which initially gets all system resources and hands them out once on a first-come-first-served basis. Memory resources can be mapped between tasks at a page-size granularity. This size is predetermined by the CPU's memory management unit and is commonly set to 4 kB.

#### 4.5.1.1 Data spaces

A data space is the [L4Re](#) abstraction for objects which may be accessed in a memory mapped fashion (i.e., using normal memory read and write instructions). Examples include the sections of a binary which the loader attaches to the application's address space, files in the ROM or on disk provided by a file server, the registers of memory-mapped devices and anonymous memory such as the heap or the stack.

Anonymous memory data spaces in particular (but in general all data spaces except memory mapped IO) can either be constructed entirely from a portion of the RAM or the current working set may be multiplexed on some portion of the RAM. In the first case it is possible to eagerly insert all pages (more precisely page-frame capabilities) into the application's address space such that no further page faults occur when this data space is accessed. In general, however, only the pages for some portion are provided and further pages are inserted by the pager as a result of page faults.

#### 4.5.1.2 Virtual Memory Handling

The virtual memory of each task is constructed from data spaces backing virtual memory regions (VMRs). The management of the VMRs is provided by an object called *region map*. A dedicated region-map object is associated with each task; it allows attaching and detaching data spaces to an address space as well as reserving areas of virtual memory. Since the region-map object possesses all knowledge about the virtual memory layout of a task, it also serves as an application's default pager.

#### 4.5.1.3 Memory Allocation

Operating systems commonly use anonymous memory for implementing dynamic memory allocation (e.g., using `malloc` or `new`). In an L4Re-based system, each task gets assigned a memory allocator providing anonymous memory using data spaces.

See also

[L4Re::Dataspace](#) and [L4Re::Rm](#).

## 4.6 Program Input and Output

The initial environment provides a Vcon capability used as the standard input/output stream.

Output is usually connected to the parent of the program and displayed as debugging output. The standard output is also used as a back end to the C-style printf functions and the C++ streams.

Vcon services are implemented in Moe and the loader as well as by the [L4Re](#) Microkernel and connected either to the serial line or to the screen if available.

See also

[Virtual Console](#)

## 4.7 Initial Memory Allocator and Factory

The purpose of the memory allocator and of the factory is to provide the application with the means to allocate memory (in the form of data spaces) and kernel objects respectively.

An initial memory allocator and an initial factory are accessible via the initial [L4Re](#) environment.

See also

[L4Re::Mem\\_alloc](#)

The factory is a kernel object that provides the ability to create new kernel objects dynamically. A factory imposes a resource limit for kernel memory, and is thus a means to prevent denial of service attacks on kernel resources. A factory can also be used to create new factory objects.

See also

[Factory](#)

## 4.8 Application and Server Building Blocks

So far we have discussed the environment of applications in which a single thread runs and which may invoke services provided through their initial objects.

In the following we describe some building blocks to extend the application in various dimensions and to eventually implement a server which implements user-level objects that may in turn be accessed by other applications and servers.

### 4.8.1 Creating Additional Application Threads

To create application threads, one must allocate a stack on which this thread may execute, create a thread kernel object and setup the information required at startup time (instruction pointer, stack pointer, etc.). In [L4Re](#) this functionality is encapsulated in the pthread library.

## 4.8.2 Providing a Service

In capability systems, services are typically provided by transferring a capability to those applications that are authorised to access the object to which the capability refers to.

Let us discuss an example to illustrate how two parties can communicate with each other: Assume a simple file server, which implements an interface for accessing individual files: `read(pos, buf, length)` and `write(pos, data, length)`.

L4Re provides support for building servers based on the class `L4::Server_object`. `L4::Server_object` provides an abstract interface to be used with the `L4::Server` class. Specific server objects such as, in our case, files inherit from `L4::Server_object`. Let us call this class `File_object`. When invoked upon receiving a message, the `L4::Server` will automatically identify the corresponding server object based on the capability that has been provided to its clients and invoke this object's `dispatch` function with the incoming message as a parameter. Based on this message, the server must then decide which of the protocols it implements was invoked (if any). Usually, it will evaluate a protocol specific opcode that clients are required to transmit as one of the first words in the message. For example, assume our server assigns the following opcodes: `Read = 0` and `Write = 1`. The `dispatch` function calls the corresponding server function (i.e., `File_object::read()` or `File_object::write()`), which will in turn parse additional parameters given to the function. In our case, this would be the position and the amount of data to be read or written. In case the write function was called the server will now update the contents of the file with the data supplied. In case of a read it will store the requested part of the file in the message buffer. A reply to the client finishes the client request.

## 4.9 Pthread Support

L4Re supports the standard pthread library functionality.

Therefore L4Re itself does not contain any documentation for pthreads itself. Please refer to the standard pthread documentation instead.

The L4Re specific parts will be described herein.

- Include pthread-l4.h header file:

```
#include <pthread-l4.h>
```

- Return the local thread capability of a pthread thread:

Use `pthread_l4_cap(pthread_t t)` to get the capability index of the pthread t.

For example:

```
pthread_l4_cap(pthread_self());
```

- Setting the L4 priority of an L4 thread works with a special scheduling policy (other policies do not affect the L4 thread priority):

```
pthread_t t;
pthread_attr_t a;
struct sched_param sp;

pthread_attr_init(&a);
sp.sched_priority = l4_priority;
pthread_attr_setschedpolicy(&a, SCHED_L4);
pthread_attr_setschedparam(&a, &sp);
pthread_attr_setinheritsched(&a, PTHREAD_EXPLICIT_SCHED);

if (pthread_create(&t, &a, pthread_func, NULL))
    // failure...

pthread_attr_destroy(&a);
```

- You can prevent your pthread from running immediately after the call to `pthread_create(..)` by adding `PTHREAD_L4_ATTR_NO_START` to the `create_flags` of the pthread attributes. To finally start the thread you need to call `scheduler()->run_thread()` passing the capability of the pthread and scheduling parameters.

```
pthread_t t;
pthread_attr_t attr;

pthread_attr_init(&attr);
attr.create_flags |= PTHREAD_L4_ATTR_NO_START;

if (pthread_create(&t, &attr, pthread_func, nullptr))
    // failure...

pthread_attr_destroy(&attr);

// do stuff

auto ret = L4Re::Env::env()->scheduler()->run_thread(pthread_l4_cap(t),
                                                    l4_sched_param(2));

if (l4_error(ret))
    // failure...
```

### Constraints on pthread\_t, user-land capability slot, and kernel thread-object

- `pthread_l4_cap()` is guaranteed to return the valid capability slot of the pthread (A) until `pthread_join()` or `pthread_detach()` is invoked on (A)'s `pthread_t`.
- `pthread_l4_cap()` exposes internal state of the pthread management, take the necessary precautions as you would for any shared data in concurrent environments. If you use `pthread_l4_cap()` guarding against concurrency issues is your duty.
- There is no guarantee that a valid capability slot points to a present capability.

#### • Example

It is possible to obtain a valid thread capability slot and for `l4_task_cap_valid()` to return the capability as not present. The following example showcases a possible sequence of events.

```
// Assume: void some_func(void *)
pthread_t pthread = nullptr;
pthread_create(&pthread, nullptr, some_func, nullptr);

// pthread running some_func()
l4_cap_idx_t cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // --> true

long valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label();
// valid == 1 --> capability object is present (refers to a kernel object).

// some_func() exits

cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // --> true

valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label();
// valid == 0 --> capability object is not present (refers to no kernel object).

pthread_join(pthread, nullptr); // invalidates the cap slot and frees
                                // the pthread's data structures

// using cap_idx here is undefined behavior.
```

## 4.10 Interface Definition Language

An interface definition in [L4Re](#) is normally declared as a class derived from [L4::Kobject\\_t](#).

For example, the simple calculator example declares its interface like that:

```
struct Calc : L4::Kobject_t<Calc, L4::Kobject>
{
    L4_INLINE_RPC(int, sub, (l4_uint32_t a, l4_uint32_t b, l4_uint32_t *res));
```

```
L4_INLINE_RPC(int, neg, (l4_uint32_t a, l4_uint32_t *res));

typedef L4::Typeid::Rpc<sub_t, neg_t> Rpc<sub_t, neg_t>;
```

The signature of each function is first declared using one of the RPC macros (see below) and then all the functions need to be listed in the `Rpcs` type.

Clients invoke these functions with the name given to the RPC macros, `sub` and `neg` above. Servers implement them by defining functions with an `op_` prepended, `op_sub` and `op_neg`. The types of the parameters in the macro definition, on the server side, and on the client side are not the same. The following section describes how they are related to each other.

### 4.10.1 Parameter types for RPC

Generally all value parameters, const reference parameters, and const pointer parameters to an RPC interface are considered as input parameters for the RPC and are transmitted from the client to the server.

#### Note

This means that `char const *` is treated as an input `char` and not as a zero terminated string value, for strings see `L4::lpc::String<>`.

Parameters that are non-const references or non-const pointers are treated as output parameters going from the server to the client.

There are special data types that appear on only one side (client or server) when used, see the following table for details.

```
L4_RPC(long, test, (int arg1, char const *arg2, unsigned *ret1));
```

The example shows the declaration of a method called `test` with `long` as return type, `arg1` is an `int` input, `arg2` a `char` input, and `ret1` an `unsigned` output parameter.

Type	Direction	Client-Type	Server-Type
T	Input	T	T
T const &	Input	T const &	T const &
T const *	Input	T const *	T const &
T &	Output	T &	T &
T *	Output	T *	T &
<a href="#">L4::Ipc::In_out&lt;T &amp;&gt;</a>	In/Out	T &	T &
<a href="#">L4::Ipc::In_out&lt;T *&gt;</a>	In/Out	T *	T &
<a href="#">L4::Ipc::Cap&lt;T&gt;</a>	Input	<a href="#">L4::Ipc::Cap&lt;T&gt;</a>	<a href="#">L4::Ipc::Snd_fpage</a>
<a href="#">L4::Ipc::Out&lt;L4::Cap&lt;T&gt; &gt;</a>	Output	<a href="#">L4::Cap&lt;T&gt;</a>	<a href="#">L4::Ipc::Cap&lt;T&gt; &amp;</a>
<a href="#">L4::Ipc::Rcv_fpage</a>	Input	<a href="#">L4::Ipc::Rcv_fpage</a>	void
<a href="#">L4::Ipc::Small_buf</a>	Input	<a href="#">L4::Ipc::Small_buf</a>	void

Array types can be used to transmit arrays of variable length. They can either be stored in a client-provided buffer ([L4::lpc::Array](#)), copied into a server-provided buffer ([L4::lpc::Array\\_in\\_buf](#)) or directly read and written into the UTCB ([L4::lpc::Array\\_ref](#)). For latter type, the start position of an array type needs to be known in advance. That implies that only one such array can be transmitted per direction and it must be the last part in the message.

Type	Direction	Client-Type	Server-Type
<code>L4::Ipc::Array&lt;const T&gt;</code>	Input	<code>L4::Ipc::Array&lt;const T&gt;</code>	<code>L4::Ipc::Array_ref&lt;const T&gt;</code>
<code>L4::Ipc::Array&lt;const T&gt;</code>	Input	<code>L4::Ipc::Array&lt;const T&gt;</code>	<code>L4::Ipc::Array_in_buf&lt;const T&gt; &amp;</code>
<code>L4::Ipc::Array&lt;T&gt; &amp;</code>	Output	<code>L4::Ipc::Array&lt;T&gt; &amp;</code>	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>
<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>	Output	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>

Finally, there are some optional types where the sender can choose if the parameter should be included in the message. These types are for the implementation of some legacy message formats and should generally not be needed for the definition of ordinary interfaces.

Type	Direction	Client-Type	Server-Type
<code>L4::Ipc::Opt&lt;T&gt;</code>	Input	<code>L4::Ipc::Opt&lt;T&gt;</code>	<code>T</code>
<code>L4::Ipc::Opt&lt;const T*&gt;</code>	Input	<code>L4::Ipc::Opt&lt;const T*&gt;</code>	<code>T</code>
<code>L4::Ipc::Opt&lt;T &amp;&gt;</code>	Output	<code>T &amp;</code>	<code>L4::Ipc::Opt&lt;T&gt; &amp;</code>
<code>L4::Ipc::Opt&lt;T *&gt;</code>	Output	<code>T *</code>	<code>L4::Ipc::Opt&lt;T&gt; &amp;</code>
<code>L4::Ipc::Opt&lt;Array↔_ref&lt;T&gt; &amp;&gt;</code>	Output	<code>Array_ref&lt;T&gt; &amp;</code>	<code>L4::Ipc::Opt&lt;Array↔_ref&lt;T&gt;&gt; &amp;</code>

### 4.10.2 RPC Return Types

On the server side, the return type of an RPC handling function is always `long`. The return value is transmitted via the label field in `l4_msgtag_t` and is therefore restricted to its length. Per convention, a negative return value is interpreted as an error condition. If the return value is negative, output parameters are not transmitted back to the client.

#### Attention

The client must never rely on the content of output parameters when the return value is negative.

On the client-side, the return value of the RPC is set as defined in the RPC macro. If `l4_msgtag_t` is given, then the client has access to the full message tag, otherwise the return type should be `long`. Note that the client might not only receive the server return value in response but also an IPC error code.

### 4.10.3 RPC Method Declaration

RPC member functions can be declared using one of the following C++ macros.

For inline RPC stubs, where the RPC stub code itself is `inline`:

- `L4_INLINE_RPC(res, name, (args...), flags)`  
Define an inline RPC call (type and callable).
- `L4_INLINE_RPC_OP(op, res, name, (args...), flags)`  
Define an inline RPC call with specific opcode (type and callable).
- `L4_INLINE_RPC_NF(res, name, (args...), flags)`  
Define an inline RPC call type (the type only, no callable).

- `L4_INLINE_RPC_NF_OP`(opcode, Ret\_type, func\_name, (args...), flags)

Define an inline RPC call type with specific opcode (the type only, no callable).

For external RPC stubs, where the RPC stub code must be defined in a separate compile unit (usually a `.cc` file):

- `L4_RPC`(Ret\_type, func\_name, (args...), flags)  
Define an RPC call (type and callable).
- `L4_RPC_OP`(opcode, Ret\_type, func\_name, (args...), flags)  
Define an RPC call with specific opcode (type and callable).
- `L4_RPC_NF`(Ret\_type, func\_name, (args...), flags)  
Define an RPC call type (the type only, no callable).
- `L4_RPC_NF_OP`(opcode, Ret\_type, func\_name, (args...), flags)  
Define an RPC call type with specific opcode (the type only, no callable).

To generate the implementation of an external RPC stub:

- `L4_RPC_DEF`(class\_name::func\_name)  
Generate the definition of an RPC stub.

The NF versions of the macro generally do not generate a callable member function named `<name>` but do only generate the type `<name>_t`. This data type can be used to call the RPC stub explicitly using `<name>_t::call(L4::Cap<Iface_class> cap, args...)`.

## 4.11 L4Re Build System

L4Re uses a custom make-based build system, often simply referred to as *BID*.

This section explains how to use BID when writing applications and libraries for L4Re.

### 4.11.1 Building L4Re

#### Setting up the Build Directory

L4Re must be built out-of-source. Therefore the first mandatory step is creating and populating a build directory. From the root of the L4Re source tree run

```
make B=<builddir>
```

Other targets that can be executed in the source directory are

**update**

Update the source directory from svn. Only makes sense when you have downloaded L4Re from the official subversion repository.

**help**

Show a short help with the most important targets.

## Invoking Make

Once the build directory is set up, BID make can be invoked in one of two ways:

1. Go to the build directory and invoke make without special options.
2. Go to a source directory with a BID make file and invoke `make O=<builddir> ....`

The default target builds the source (as you would expect), other targets that are available in build mode are

### cleanfast

Quickly cleans the build directory by removing all subdirectories that contain generated files. The configuration will remain untouched.

### clean

Remove generated files. Slower than `make cleanfast` but can be used on selected packages. Use `S=...` to select the target package.

In addition to these targets, there are a number of targets to generate images which are explained elsewhere.

## 4.11.2 Writing BID Make Files

The BID build system exports different roles that define what should be done in the subdirectory. So a BID make file essentially consists of defining the role and a number of role-dependent make variables. The basic layout should look like this:

```
PKGDIR  ?= <path to package's root directory> # e.g., '.' or '..'
L4DIR   ?= <path to L4Re source directory>    # e.g. '$(PKGDIR)/../../'

<various definitions>

include $(L4DIR)/mk/<role>.mk
```

`PKGDIR` in the first line defines the root directory of the current package. `L4DIR` in the next line must be pointed to the root of the [L4Re](#) source tree the package should be built against. After this custom variable definitions for the role follow. In the final line of the file, the make file with the role-specific rules must be sourced.

The following roles are currently defined:

- `project.mk` - Sub-project Role
- `subdir.mk` - Directory Role
- `prog.mk` - [Application Role](#)
- `lib.mk` - Library Role
- `include.mk` - [Header File Role](#)
- `doc.mk` - Documentation Role
- `test.mk` - [Test Application Role](#)
- `idl.mk` - IDL File Role (currently unused)
- `runux.mk` - Tests in FiascoUX Role

## BID-global Variables

This section lists variables that configure how the BID build system behaves. They are applicable for all roles.

Variable	Description
CC	C compiler for target
CXX	C++ compiler for target
HOST_CC	C compiler for host
HOST_CXX	C++ compiler for host

### 4.11.3 prog.mk - Application Role

The prog role is used to build executable programs.

#### General Configuration Variables

The following variables can only be set globally for the Makefile:

MODE

Kind of target to build for. The following values are possible:

- `static` - build a statically linked binary (default)
- `shared` - build a dynamically linked binary
- `l4linux` - build a binary for running on L4Linux on the target platform
- `host` - build for host system
- `targetsys` - build a binary for the target platform with the compiler's default settings

SYSTEMS

List of architectures the target can be built for. The entries must be space-separated entries either naming an architecture (e.g. amd64) or an architecture and ABI (e.g. arm-l4f). When not defined, the target will be built for all possible platforms.

TARGET

Name or names of the binaries to compile. This variable may also be postfixed with a specific architecture.

### Target-specific Configuration Variables

The following variables may either be used with or without a description suffix. Without suffix they will be used for all operations. With a specific description their use is restricted to a subset. These specifications include a target file and the architecture, both optional but in this order, separated by underscores. The specific variables will be used in addition to the more general ones.

`SRC_C / SRC_CC / SRC_F / SRC_S`

.c, .cc, .f90, .S source files.

`REQUIRES_LIBS`

List of libraries the binary depends on. This works only with libraries that export a `pkg_config` configuration file. Automatically adds any required include and link options.

`DEPENDS_PKGS`

List of packages this binary depends on. If one these packages is missing then building of the binary will be skipped.

`CPPFLAGS / CFLAGS / CXXFLAGS / FFLAGS / ASFLAGS`

Options for the C preprocessor, C compiler, C++ compiler, Fortran compiler and assembler. When used with suffix, the referred element is the source file, not the target file.

`LDFLAGS`

Options for the linker ld.

`LIBS`

Additional libraries to link against (with -l).

`PRIVATE_LIBDIR`

Additional directories to search for libraries.

`CRT0 / CRTN`

(expert use only) Files containing custom startup and finish code.

`LDSCRIPT`

(expert use only) Custom link script to use.

#### 4.11.4 include.mk - Header File Role

The header file role is responsible for installing header file at the appropriate location.

The following variables can be used for customizing the process:

`INCSRC_DIR`

Source directory where the headers can be found. Default is the directory where the Makefile resides.

`TARGET`

List of header files to install. If left undefined, then `INCSRC_DIR` will be scanned for files with suffix `.h` or `.i`.

`EXTRA_TARGET`

When `TARGET` is undefined, then add these files to the headers found by scanning the source directory. Has no effect if `TARGET` has been defined.

`CONTRIB_HEADERS`

When set, the headers will be installed in `${BUILDDIR}/include/contrib/${PKGNAME}` rather than `${BUILDDIR}/include/l4/${PKGNAME}`.

`INSTALL_INC_PREFIX`

Base directory where to install the headers. Overwrites `CONTRIB_HEADERS`. The headers will then be found under `${BUILDDIR}/include/${INSTALL_INC_PREFIX}`.

`PC_FILENAME`

When set, a `pkg_config` configuration file is created with the given name.

### 4.11.5 test.mk - Test Application Role

The test role is very similar to the application role, it also builds an executable binary.

The difference is that it also builds for each target a test script that executes the test target either on the host (MODE=host) or a target platform (currently only qemu).

The role accepts all make variables that are accepted by the application role. The only difference is that the `TARGET` variable is not required. If it is missing, the source directory will be scanned for source files that fit the pattern `test_*.c[c]` and create one target for each of them.

#### Note

It is possible to still use `SRC_C[C]` when targets are determined automatically. In that case the specified sources will be used in addition\* to the main `test_*.c[c]` source.

In addition to the variables above, there are a number of variables that control how the test is executed. All these variables may be used as a global variable that applies to all test or, if the target name is added as a suffix, set for a specific target only.

#### TEST\_TARGET

Name of binary containing the test (default: same as `TARGET`).

#### TARGET\_\$ (ARCH)

When `TARGET` is undefined, these targets are added to the list of targets for the specified architecture. For all targets `SRC_C[C]` files must be defined separately.

#### TEST\_KERNEL\_ARGS

Arguments to append to the kernel command line. These are also appended when specifying custom ones via a `.t`-file's `-f` parameter or when using `-d`.

#### TEST\_EXPECTED

File containing expected output. By default the variable is empty, which means the test binary is expected to produce TAP test output, that can be directly processed. When the `TEST_TAP_PLUGINS` variable is given, `TEST_EXPECTED` is ignored.

#### TEST\_EXPECTED\_REPEAT

Number of times the expected output should be repeated, by default 1. When set to 0 then output is expected to repeat forever. This is particularly useful to make sure that stress tests that are meant to run in an endless loop are still alive. Note that such endless tests can only be run by directly executing the test script. They will be skipped when run in a test harness like `prove`.

`TEST_TAP_PLUGINS`

Specify the plugins that are used to process the output of the test run. The syntax is of the values is:

`plugin1:arg1=a,arg2=b plugin2:arg=foo`

Multiple plugins separated by a space are loaded in order. Spaces are not allowed inside a plugin specification. One or more arguments are optionally passed to the plugin separated by commas and delimited by a colon.

If the variable is not specified the plugins for `TAPOutput` and `OutputMatching` (depending on the `TEST_EXPECTED` variable) are automatically loaded.

For the supported plugins and their options please refer to their in-line documentation in `tool/lib/L4/TapWrapper/Plugin/`. The plugin name corresponds to the file stem name in that directory.

`TEST_TIMEOUT`

Non-standard timeout after which the test run is aborted (useful for tests involving sleep).

`NED_CFG`

LUA configuration file for startup to give to Ned

`REQUIRED_MODULES`

Additional modules needed to run the test. By adding `[opts]` to the name of a module you can add module options that are reflected in the generated `modules.list`.

`BOOTSTRAP_ARGS`

Additional parameters to supply to bootstrap.

`QEMU_ARGS`

Additional parameters to supply to QEMU.

`MOE_ARGS`

Additional parameters to supply to moe.

`TEST_ARGS`

Additional arguments for the `TEST_STARTER` (tapper-wrapper per default).

`TEST_ROOT_TASK`

Alternative root task to be used during a test instead of moe.

`TEST_ROOT_TASK_ARGS`

Arguments passed to `TEST_ROOT_TASK` if `TEST_ROOT_TASK` is different from moe.

`KERNEL_CONF`

Features the [L4Re](#) Microkernel must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` looks for a `globalconfig.out` file in the same directory as the kernel and checks that all options are enabled. If not, the test is skipped. Has only an effect if the `globalconfig.out` file is present.

`L4RE_CONF`

Features the [L4Re](#) userland must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` will look for these in the `.kconfig` file in the [L4Re](#) build directory.

`L4LINUX_CONF`

Features the L4Linux kernel must have been compiled with. Similar to `KERNEL_CONF` but checks for a `.config` file in the directory of the L4Linux kernel.

`TEST_SETUP`

Command to execute before the test is run. The test will only be executed if the command returns 0. If the exit code is 69, the test is marked as skipped with the reason provided in the final line of stdout.

`TEST_LOGFILE`

Append output of test execution to the given file unless `TEST_WORKDIR` is given.

`TEST_WORKDIR`

Create logs, temp and other files below the given directory. That directory is taken as base dir for more automatically created subdir levels using the current test path, in order to guarantee conflict-free usage when running many different tests with a common workdir. When `TEST_WORKDIR` is provided then `TEST_LOGFILE` is ignored as it is organized below workdir.

`TEST_TAGS`

List of conditions for tags provided during execution of a test. A tag can be set to 1, set to 0 or be unspecified via `TEST_RUN_TAGS` during execution. Therefore there are 4 possible conditions for a tag that can be specified in `TEST_TAGS`: `tag`, `!tag`, `+tag` and `-tag`. The following table shows the conditions they represent.

<code>TEST_RUN_TAGS \ TEST_TAGS</code>	<code>tag</code>	<code>!tag</code>	<code>+tag</code>	<code>-tag</code>
<code>tag</code> or <code>tag=1</code>	y		y	
unspecified		y	y	
<code>tag=0</code>		y		y

*Example usage:*

The tag `long-running` is used by tests which take a long time and should be skipped by default. These tests are marked with the tag `long-running` unprefixed.

The tag `hardware` is set to 1 at runtime when the tests will run on real hardware. Tests that must not run on real hardware are marked with `!hardware`.

The tag `+impl-def` is used by tests that test implementation details. Due to the nature of this flag we

require the "+" prefix to be used, so they are run by default but can be excluded from execution by setting `TEST_RUN_TAGS` to `impl-def=0` at runtime.

If you want to specify multiple tag conditions they need to be separated with a comma.

#### `TEST_PLATFORM_ALLOW` and `TEST_PLATFORM_DENY`

Deny and allow lists of platforms a test is banned from or limited to. If you list platforms in the `TEST_PLATFORM_ALLOW` variable the test will only be run on these listed platforms and will be skipped on any other platform. If you list platforms in the `TEST_PLATFORM_DENY` variable the test will be skipped on the listed platforms and will be run on any other platform. You can only use one of these variables per test, not both. See `mk/platforms/` for the various identifiers.

*Example usage:*

```
# Do not run this test on the Raspberry Pi platform
TEST_PLATFORM_DENY_test_xyz := rpi

# Only run this test on this test on the RCar3 platform.
TEST_PLATFORM_ALLOW_test_abc := rcar3
```

#### `TAPARCHIVE`

Filename for an archive file to store the resulting TAP output.

In addition to compiled tests, it is also possible to create tests where the test binary or script comes from a different source. These tests must be listed in `EXTRA_TARGET` and for each target a custom `TEST_TARGET` must be provided.

## Running Tests

The make role creates a test script which can be found in `<builddir>/test/t/<arch>/<api>`. It is possible to organise the tests further in subdirectories below by specifying a `TEST_GROUP`.

To be able to execute the test, a minimal test environment needs to be set up by exporting the following environment variables:

`KERNEL_<arch>`, `KERNEL`

[L4Re](#) Microkernel binary to use. The test runner is able to check if the kernel has all features necessary for the test and skip tests accordingly. In order for this to work, the `globalconfig.out` config file from the build directory needs to be available in the same directory as the kernel.

`L4LX_KERNEL_<arch>`, `L4LX_KERNEL`

L4Linux binary to use. This is only required to run tests in `mode=l4linux`. If no L4Linux kernel is set then these tests will simply be skipped. The test runner is also able to check if the kernel has all features compiled in that are required to run the test successfully (see make variable `L4LINUX_CONF` above). For this to work, the `.config` configuration file from the build directory needs to be available in the same directory as the kernel.

`LINUX_RAMDISK_<arch>, LINUX_RAMDISK`

Ramdisk to mount as root in L4Linux. This is only required to run tests in `mode=l4linux`. If not supplied, L4Linux tests will be skipped. The ramdisk must be set up to start the test directly after the initial startup is finished. The name of the test binary is supplied via the kernel command line option `l4re_testprog`. The `tool/test` directory contains an example script `launch-l4linux-test`, which can be copied onto the ramdisk and started by the init script.

`TEST_HWCONFIG` and `TEST_FIASCOCONFIG`

Some userland tests rely on external information about the underlying platform and the configuration of the L4Re Microkernel to decide whether or not to test specific features or to determine which and how much resources are available. Some examples for this are whether or not virtualization is supported by the platform, how many cores the platform has, how many cores the kernel supports or how much memory the platform provides. To convey this information to these tests you can set the two environment variables `TEST_HWCONFIG` and `TEST_FIASCOCONFIG`.

Using `TEST_HWCONFIG` requires a plain text document containing key-value pairs separated by a `=` symbol. On top of that comment lines starting with `#` are supported. Simply create a plain text file such as the following and set `TEST_HWCONFIG` to its absolute path.

```
VIRTUALIZATION=y
MP=y
NUM_CORES=4
MEMORY=2048
```

Using `TEST_FIASCOCONFIG` is easier since it only needs to contain the absolute path of the `globalconfig.out` file in the L4Re Microkernel's build directory. The build system will then extract the information when a test is started.

When starting a test the build system will read both files and provide their content as a lua table to the test. A test script can then make decisions based on them. To simplify some decisions the build system merges some information by itself, e.g. virtualization is only available if both the platform and the L4Re Microkernel support this feature. More details can be obtained from the perl module in `tool/lib/L4/TestEnvLua.pm`.

In addition to these variables, the following BID variables can be overwritten at runtime: `PT` (for the platform type) and `TEST_TIMEOUT`. You may also supply `QEMU_ARGS` and `MOE_ARGS` which will be appended to the parameters specified in the BID test make file.

Once the environment is set up, the tests can be run either by simply executing all of them from the build directory with

```
make test
```

or executing them directly, like

```
test/t/amd64_amdfam10/l4f/l4re-core/moe/test_namespace.t
```

or running one or more tests through the test harness `prove`, like

```
prove test/t/amd64_amdfam10/l4f/l4re-core/moe/test_namespace.t
prove -r test/t/amd64_amdfam10/l4f/l4re-core/
prove -rv test/t/amd64_amdfam10/l4f/l4re-core/
```

`TEST_TAGS` allow for a way to include or exclude whole groups of tests during execution, primarily with `prove`. You can specify which tests to run at runtime using one of the following ways:

```
$ test/t/amd64_amdfam10/l4f/l4re-core/test_one.t --run-tags slow,gtest-shuffle=0
$ test/t/amd64_amdfam10/l4f/l4re-core/test_one.t -T slow,gtest-shuffle=0
$ prove -r test/t/amd64_amdfam10/l4f/l4re-core/ :: -T slow,gtest-shuffle=0
$ TEST_RUN_TAGS=slow,gtest-shuffle=0 prove -r test/t/amd64_amdfam10/l4f/l4re-core/
```

For each test tag requirements defined in the corresponding `TEST_TAGS` Makefile variable are tested. If the requirements for tags do not match the test is skipped. The `SKIP` message will provide insight why the test was skipped:

```
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... skipped: Running this test requires tag slow to be set to 1.
test/t/amd64_amdfam10/test_three.t .. ok
```

When tags are provided, the tests requiring those tags are now also executed while the tests that forbid them are skipped:

```
$ TEST_RUN_TAGS=slow,gtest-shuffle
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... ok
test/t/amd64_amdfam10/test_three.t .. skipped: Running this test requires tag gtest-shuffle to be set to 0 or
```

For further details on how values in `TEST_TAGS` and `TEST_RUN_TAGS` interact, see the help text for `TEST_TAGS`.

## Running Tests in External Programs

You can hand-over test execution to an external program by setting the environment variable `EXTERNAL_TEST↵_STARTER` to the full path of that program:

```
export EXTERNAL_TEST_STARTER=/path/to/external/test-starter
make test
```

`EXTERNAL_TEST_STARTER`

This variable is evaluated by `tool/bin/run_test` (the backend behind `make test`) and contains the full path to the tool which actually starts the test instead of the test itself.

The `EXTERNAL_TEST_STARTER` can be any program instead of the default execution via `make qemu E=maketest`. Its output is taken by `run_test` as the test output.

Usually it is just a bridge to prepare the test execution, e.g., it could create the test as image and start that image via a simulator.

## Running Tests in a Simulator

Based on above mechanism there is a dedicated external test starter `tool/bin/teststarter-image-telnet.pl` shipped in BID which assumes an image to be started with another program which provides test execution output on a network port.

This can be used to execute tests in a simulator, like this:

```
export EXTERNAL_TEST_STARTER=$L4RE_SRC/tool/bin/teststarter-image-telnet.pl
export SIMULATOR_START=/path/to/configured/simulator-exe
make test
```

After building the image and starting the simulator it contacts the simulator via a network port (sometimes called "telnet" port) to pass-through its execution output as its own output so it gets captured by `run_test` as usual.

The following variables control `teststarter-image-telnet.pl`:

### `SIMULATOR_START`

This points to the full path of the program that actually starts the prepared test image. Most often this is the frontend script of your simulator environment which is pre-configured so that it actually works in the way that `teststarter-image-telnet.pl` expects from the following settings.

### `SIMULATOR_IMAGETYPE`

The image type to be generated via `make $SIMULATOR_IMAGETYPE E=maketest`. Default is `elfimage`.

### `SIMULATOR_HOST`

The simulator will be contacted via socket on that host to read its output. Default is `localhost`.

### `SIMULATOR_PORT`

The simulator will be contacted via socket on that port to read its output. Default is `11111`.

### `SIMULATOR_START_SLEEP_TIME`

After starting the simulator it waits that many seconds before reading from the port. Default is `1` (second).

## Running tests without taper-wrapper

In case you want to replace the taper-wrapper test starter, you can replace the default one by setting the environment variable `TEST_STARTER` to the path of your test starter. Then your test starter can use the same environment which is normally set up for the default starter, which includes environment variables provided by the build system as well as the test itself. Among these are `SEARCHPATH`, `MODE`, `ARCH`, `MOE_CFG`, `MOE_ARGS`, `TEST_TIMEOUT`, `TEST_TARGET`, `TEST_EXPECTED`, `QEMU_ARGS` and many more.

## Debugging Tests

The test script is only a thin wrapper that sets up the test environment as it was defined in the make file and then executes two scripts: `tapper-wrapper` and `run_test`.

The main work horse of the two is `tool/bin/run_test`. It collects the necessary files and starts qemu to execute the test. This script is always required.

There is then a second script wrapped around the test runner: `tool/bin/tapper-wrapper`. This tool inspects the output of the test runner and reformats it, so that it can be read by tools like `prove`. If the test produces tap output, then the script scans for this output and filters away all the debug output. If `TEST_EXPECTED` was defined, then the script scans the output for the expected lines and prints a suitable TAP message with success or failure. It also makes sure that qemu is killed as soon as the test is finished.

There are a number of command-line parameters that allow to quickly change test parameters for debugging purposes. Run the test with `'-help'` for more information about available parameters.

## 4.12 Kernel Factory

The kernel factory is a kernel object that provides the ability to create new kernel objects dynamically.

The kernel factory enforces a memory quota. This quota defines the maximum amount of kernel memory the factory service can use to construct the requested objects. When the quota is depleted, the factory refuses the creation of new objects.

The quota may be higher than the amount of available kernel memory; ultimately, the amount of available kernel memory is the strict limit for the factory to remain operational.

The kernel factory creates the following kinds of objects:

- [DMA space](#)
- [L4::Factory](#)
- [L4::lpc\\_gate](#) ([L4\\_PROTO\\_NONE](#), [L4\\_PROTO\\_KOBJECT](#))
- [L4::Irq](#) ([L4\\_PROTO\\_IRQ\\_SENDER](#))
- [L4::Semaphore](#)
- [L4::Task](#)
- [L4::Thread](#)
- [L4::Vm](#)

The protocol IDs for objects in this list are given in [L4\\_msgtag\\_protocol](#). Kernel objects whose protocol ID is not immediately clear from the documentation of [L4\\_msgtag\\_protocol](#) have their protocol IDs stated within parenthesis. As an exception, [L4::lpc\\_gate](#) can be identified by more than one protocol IDs. The protocol ID shall be used as the second argument for [L4::Factory.create](#)([Cap<void>](#), long, [l4\\_utcb\\_t](#) \*).

For the C++ interface see [L4::Factory](#), for the C interface see [Factory](#).

### 4.12.1 Passing parameters for the create stream

[L4::Factory.create\(\)](#) returns a [create stream](#) that allows arguments to be forwarded to the constructor of the object to be created.

Objects that support additional parameters on their creation are presented with a non-empty list of parameters. The parameters are listed in the order they should be provided to a create stream returned by [L4::Factory.create\(\)](#).

- [Dmar\\_space\(\)](#)
- [L4::Factory\(l4\\_umword\\_t\)](#)
  - Argument: factory quota (in bytes).
  - See [L4::Factory.create\\_factory\(\)](#) for details.
- [L4::lpc\\_gate\(\)](#)
  - Creates an unbound IPC gate.
  - Alternatively, an IPC gate can be immediately bound to a thread upon creation using [L4::Factory.create\\_gate\(\)](#).
- [L4::lirq\(\)](#)
- [L4::Semaphore\(\)](#)
- [L4::Task\(l4\\_fpage\\_t\)](#)
  - Argument: utcb\_area
  - See [L4::Factory.create\\_task\(\)](#) for details.
- [L4::Thread\(\)](#)
- [L4::Vm\(\)](#)

# Chapter 5

## L4Re Servers

Here you shall find a quick overview over the standard services running on the [L4Re](#) Microkernel.

### Sigma0, the Root Pager

Sigma0 is a special server running on [L4](#) because it is responsible of resolving page faults for the root task, the first useful task on [L4Re](#). Sigma0 can be seen as part of the kernel, however it runs in unprivileged mode. To run something useful on the [L4Re](#) Microkernel you usually need to run Sigma0, nevertheless it is possible to replace Sigma0 by a different implementation.

For more details see [Sigma0, the Root-Pager](#)

### Moe, the Root Task

Moe is our implementation of the [L4](#) root task that is responsible for bootstrapping the system, and to provide basic resource management services to the applications on top. Therefore Moe provides [L4Re](#) resource management and multiplexing services:

- **Memory** in the form of memory allocators ([L4Re::Mem\\_alloc](#), [L4::Factory](#)) and data spaces ([L4Re::Dataspace](#))
- **Cpu** in the form of basic scheduler objects ([L4::Scheduler](#))
- **Vcon** multiplexing for debug output (output only)
- **Virtual memory management** for applications, [L4Re::Rm](#)

Moe further provides an implementation of [L4Re](#) name spaces ([L4Re::Namespace](#)), which are for example used to provide a read only directory of all multi-boot modules. In the case of a boot loader, like grub that enables a VESA frame buffer, there is also a single instance of an [L4Re](#) graphics session ([L4Re::Goos](#)).

To start the system Moe starts a single ELF program, the init process. The init process (usually Ned, see the next section) gets access to all resources managed by Moe and to the Sigma0 root pager interface.

For more details see [Moe, the Root-Task](#).

## Ned, the Default Init Process

To keep the root task free from complicated scripting engines and to avoid circular dependencies in application startup (that could lead to dead locks) the configuration and startup of the real system is managed by an extra task, the init process.

Ned is such an init process that allows system configuration via Lua scripts.

For more information see [Ned](#).

## Io, the Platform and Device Resource Manager

Because all peripheral management in [L4Re](#) is done in user-level applications, there is the need to have a centralized management of the resources belonging to the platform and to peripheral devices.

This is the job of Io. Io provides portable abstractions for iterating and accessing devices and their resources (IRQ's, IO Memory...), as well as delegating access to those resources to other applications (e.g., device drivers).

For more details see [Io, the Io Server](#).

## Other Servers

The following additional server package are available on top of the core [L4Re](#) environment.

- [Rtc, the Real-Time Clock Server](#)  
is a simple multiplexer for real-time clock hardware on your platform.
- [fb-drv, the Low-Level Graphics Driver](#)  
provides low-level access and initialization of various graphics hardware. It has support for running VESA BIOS calls on Intel x86 platforms, as well as support for various ARM display controllers. `fb-drv` provides a single instance of the `L4Re::Goos` interface and can serve as a back end for the Mag server, in particular, if there is no graphics support in the boot loader.
- [AHCI driver](#)
- [Cons, the Console Multiplexer](#)  
An interactive multiplexer for console in- and output. It buffers the output from different L4 clients and allows to switch between them to redirect input.
- [Sigma0, the Root-Pager](#)
- [Mag, the GUI Multiplexer](#)  
Our default multiplexer for the graphics hardware is Mag. Mag is a Nitpicker (TODO: ref) derivate that allows secure multiplexing of the graphics and input hardware among multiple applications and multiple complete windowing environments.
- [NVMe server](#)
- [Uvmm, the virtual machine monitor](#)
- [l4vio\\_net\\_p2p, a virtual network point-to-point link](#)

## 5.1 Sigma0, the Root-Pager

Sigma0 is a special [L4](#) server that serves as the origin for mapping memory.

It is started by Fiasco.OC on the system boot and gets full access to all userland RAM and device memory. It functions as the pager (main memory provider) for Moe and as the provider for device memory for Io. Moe and Io are trusted and usually the only applications besides Ned that get a capability for Sigma0. Memory can be requested from Sigma0 directly via an IPC, or indirectly by causing page faults and having them resolved by Sigma0.

### 5.1.1 Factory

There is only one instance of Sigma0 in an [L4Re](#) system, which is made accessible to Moe via an IPC gate capability. Using this capability, Moe can request Sigma0 to create new communication channels to itself by creating additional IPC gate capabilities. This request is done using the [L4::Factory](#) interface. This is the only kind of object that can be created by the factory in Sigma0.

List of objects that the Sigma0 Factory can create:

- Sigma0 ()
  - Use protocol id [L4\\_PROTO\\_SIGMA0](#) for creation
  - No arguments supported

See also

[Sigma0 API](#)

## 5.2 Moe, the Root-Task

Moe is the default root-task implementation for L4Re-based systems.

*Moe* is the first task which is usually started in L4Re-based systems. The micro kernel starts *Moe* as the Root-Task.

### 5.2.1 Moe objects

Moe provides a default implementation for the basic [L4Re](#) abstractions, such as data spaces ([L4Re::Dataspace](#)), region maps ([L4Re::Rm](#)), memory allocators ([L4::Factory](#), [L4Re::Mem\\_alloc](#)), name spaces ([L4Re::Namespace](#)) and so on (see [L4Re Interface](#)). These are described in the following subsections.

### 5.2.1.1 Factory

The factory in Moe is responsible for all kinds of dynamic object allocation.

Moe's factory allows allocation of the following objects:

- [L4Re::Namespace](#)
- [L4Re::Dataspace](#), RAM allocation
- [L4Re::Dma\\_space](#), memory management for DMA-capable devices
- [L4Re::Rm](#), virtual memory management for application tasks
- [L4::Vcon](#) (output only)
- [L4::Scheduler](#), to provide a restricted priority / CPU range for clients
- [L4::Factory](#), to provide a quota limited allocation for clients

#### Note

[L4::Scheduler](#) objects can be only created through the user factory provided by Moe to the initial application. Other factory instances cannot create this object.

#### 5.2.1.1.1 Passing parameters to the create stream

[L4::Factory.create\(\)](#) returns a [create stream](#) that allows arguments to be forwarded to the the object creation in Moe.

Objects that support additional parameters on their creation are presented next with a non-empty list of parameters. The parameters are listed in the order they should be provided to a create stream. Optional parameters are identified by their default values. Multiple entries in the next list denote different ways of initializing an object.

- [L4Re::Namespace](#) ()
  - For more details see [Namespace](#)
- [L4Re::Dataspace](#) (l4\_mword\_t size, l4\_umword\_t flags = 0, l4\_umword\_t align = 0)
  - Argument `size`: size in bytes (mandatory)
  - Argument `flags`: special dataspace properties, see [L4Re::Mem\\_alloc::Mem\\_alloc\\_flags](#)
  - Argument `align`: Log2 alignment of dataspace if supported by allocator
  - See detailed description of the parameters in [L4Re::Mem\\_alloc::alloc\(\)](#)
  - For details on the types of dataspace provided by Moe, see [Dataspace](#)
- [L4Re::Dma\\_space](#) ()
  - For more details see [DMA Space](#)
- [L4Re::Rm](#) ()
  - For more details see [Region Map](#)
- [L4::Vcon](#) (char const \*label, l4\_mword\_t color = 7)
  - Argument `label`: label used as prefix for the console output
  - Argument `color`: color code 0..15

- For more details see [Log Subsystem](#)
- **L4::Vcon** (`char const *label, char const *color = "w"`)
  - Argument `label`: label used as prefix for the console output
  - Argument `color`: color code
    - \* The color is identified by a single character
    - \* Supported colors: N, n, R, r, G, g, Y, y, B, b, M, m, C, c, W, w
  - For more details see [Log Subsystem](#)
- **L4::Scheduler** (`l4_mword_t limit, l4_mword_t offset, l4_umword_t bitmap = ~0UL, ...`)
  - Argument `limit`: maximum priority
  - Argument `offset`: priority offset
  - Argument `bitmap`: bitmap of CPUs - can be repeated to address higher order CPUs
  - Argument `limit` must be greater than `offset`
  - For more details see [Scheduler subsystem](#)
- **L4::Factory** (`l4_mword_t quota`)
  - Argument `quota`: limit in bytes (not zero)
  - The limit is deducted from the limit of the factory that creates the new factory

### 5.2.1.2 Namespace

Moe provides a name space conforming to the [L4Re::Namespace](#) interface (see [Name-space API](#)). Per default Moe creates a single name space for the [Boot FS](#). That is available as `rom` in the initial objects of the init process.

#### 5.2.1.2.1 Boot FS

The Boot FS subsystem provides access to the files loaded during the platform boot (or available in ROM). These files are either linked into the boot image or loaded via a flexible boot loader, such as GRUB.

The subsystem provides an [L4Re::Namespace](#) object as directory and an [L4Re::Dataspace](#) object for each file.

By default all files are read only and visible in the namespace `rom`. As an option, files can be supplied with the argument `:rw` to mark them as writable modules. Moe will allow read and write access to these dataspace and make them visible in a different namespace called ``rwfs``.

An example entry in 'modules.list' would look like this:

```
module somemodule :rw
```

#### Note

In order for a client to receive write permissions to the dataspace, the corresponding cap also needs write permissions.

### 5.2.1.3 Dataspace

Dataspaces can be allocated with an arbitrary size. The granularity for memory allocation however is the machine page size ([L4\\_PAGESIZE](#)). A dataspace user must be aware that, as a result of this page-size granularity, there may be padding memory at the end of a dataspace which is accessible to each client. Moe currently allows most dataspace operations on this padding area. Nonetheless, the client must not make any assumptions about the size or content of the padding area, as this behaviour might change in the future.

The provided data spaces can have different characteristics:

- Physically contiguous and pre-allocated
- Non contiguous and on-demand allocated with possible copy on write (COW)

Dataspaces allocated via the Moe's factory allow mappings with any combination of the read-write-execute (RWX) rights, subject to a possible restriction of the writable right for client capabilities lacking the 'W' right.

### 5.2.1.4 Log Subsystem

The logging facility of Moe provides per application tagged and synchronized log output.

### 5.2.1.5 DMA Space

### 5.2.1.6 Scheduler subsystem

The scheduler subsystem provides a simple scheduler proxy for scheduling policy enforcement.

The priority offset provided on the creation of a scheduler proxy defines the minimum priority assigned to threads which are scheduled by that instance of the scheduler proxy. The offset is implicitly added to priorities provided to [L4::Scheduler.run\\_thread\(\)](#).

### 5.2.1.7 Region Map

## 5.2.2 Command Line Options

Moe's command-line syntax is:

```
moe [--debug=<flags>] [--init=<binary>] [--l4re-dbg=<flags>] [--ldr-flags=<flags>] [-- <init options>]
```

```
--debug=<debug flags>
```

This option enables debug messages from Moe itself, the `<debug flags>` values are a combination of `info`, `warn`, `boot`, `server`, `loader`, `exceptions`, and `ns` (or all for full verbosity).

```
--init=<init process>
```

This options allows to override the default init process binary, which is 'rom/ned'.

```
--l4re-dbg=<debug flags>
```

This option allows to set the debug options for the [L4Re](#) runtime environment of the init process. The flags are the same as for `--debug=`.

```
--ldr-flags=<loader flags>
```

This option allows setting some loader options for the [L4Re](#) runtime environment. The flags are `pre_alloc`, `all_segs_cow`, and `pinned_segs`.

```
--brk=<address>
```

This option is only present on systems without MMU. It restricts dynamic allocations to addresses equal or higher than `<address>`. The argument is parsed as hexadecimal number without any `0x` prefix. Use it to prevent moe from allocating memory in regions that shall later be used by other applications or virtual machines.

```
-- <init options>
```

All command-line parameters after the special `--` option are passed directly to the init process.

## 5.3 Ned, the Init Process

Ned's job is to bootstrap the system running on [L4Re](#).

The main thing to do here is to coordinate the startup of services and applications as well as to provide the communication channels for them. The central facility in Ned is the Lua ( <http://www.lua.org>) script interpreter with the [L4Re](#) and ELF-loader bindings.

The boot process is based on the execution of one or more Lua scripts that create communication channels (IPC gates), instantiate other [L4Re](#) objects, organize capabilities to these objects in sets, and start application processes with access to those objects (or based on those objects).

For starting applications, Ned depends on the services of [Moe, the Root-Task](#) or another *loader*, which must provide data spaces and region maps. Ned also uses the 'rom' capability as source for Lua scripts and at least the 'l4re' binary (the runtime environment core) running in each application.

Each application Ned starts is equipped with an [L4Re::Env](#) environment that provides information about all the initial objects made accessible to this application.

### 5.3.1 Lua Bindings for L4Re

Ned provides various bindings for [L4Re](#) abstractions. These bindings are located in the '[L4](#)' package (`require "L4"`).

### 5.3.1.1 Capabilities in Lua

Capabilities are handled as normal values in Lua. They can be stored in normal variables or Lua compound structures (tables). A capability in Lua possesses additional information about the access rights that shall be transferred to other tasks when the capability is transferred. To support implementation of the Principle of Least Privilege, minimal rights are assigned by default. Extended rights can be added using the method `mode("...")` (short `m("...")`) that returns a new reference to the capability with the given rights.

#### Note

It is generally impossible to elevate the real access rights to an object. This means that if Ned has only restricted rights to an object it is not possible to upgrade the access rights with the `mode` method.

The capabilities in Lua also carry dynamic type information about the referenced objects. They thereby provide type-specific operations on the objects, such as the `create` operation on a generic factory or the `query` and `register` operations on a name space.

### 5.3.1.2 Access to L4Re::Env Capabilities

The initial objects provided to Ned itself are accessible via the table `L4.Env`. The default (usually unnamed) capabilities are accessible as `factory`, `log`, `mem_alloc`, `parent`, `rm`, and `scheduler` in the `L4.Env` table.

### 5.3.1.3 Constants

#### Protocols

The protocol constants are defined by default in the [L4](#) package's table `L4.Proto`. The definition is not complete and only covers what is usually needed to configure and start applications. The protocols are for example used as first argument to the `Factory:create` method.

```
Proto = {
  Dataspace = 0x4000,
  Namespace = 0x4001,
  Goos      = 0x4003,
  Mem_alloc = 0x4004,
  Rm        = 0x4005,
  Event     = 0x4006,
  Inhibitor = 0x4007,
  Sigma0    = -6,
  Log       = -13,
  Scheduler = -14,
  Factory   = -15,
  Vm        = -16,
  Dma_space = -17,
  Irq_sender = -18,
  Semaphore = -20,
  Iommu     = -22,
  Ipc_gate  = 0,
}
```

#### Rights

The rights of a Lua capability can be defined in two ways via the `:mode()` interface. Either via a string representation of the rights or via an integer value. An example for the former is `:mode("rsnc")` while the latter equivalent is `:mode(L4.Rights.r | L4.Rights.s | L4.Rights.n | L4.Rights.c)`. The following listing shows the integer constants. The constant names can be used in the string parameter to `:mode()`.

```
Rights = {
  s = 2,
  w = 1,
  r = 4,
  d = 8,
  n = 16,
```

```

c    = 32,
ro   = 4,
rw   = 5,
rws  = 7,
}

```

## Debugging Flags

Debugging flags used for the applications [L4Re](#) core:

```

Dbg = {
    Info      = 1,
    Warn      = 2,
    Boot      = 4,
    Server     = 0x10,
    Exceptions = 0x20,
    Cmd_line   = 0x40,
    Loader     = 0x80,
    Name_space = 0x400,
    All        = 0xffffffff,
}

```

## Loader Flags

Flags for configuring the loading process of an application.

```

Ldr_flags = {
    eager_map      = 0x1, -- L4RE_AUX_LDR_FLAG_EAGER_MAP
    all_segs_cow  = 0x2, -- L4RE_AUX_LDR_FLAG_ALL_SEGS_COW
    pinned_segs   = 0x4, -- L4RE_AUX_LDR_FLAG_PINNED_SEGS
}

```

### 5.3.1.4 Application Startup Details

The central facility for starting a new task with Ned is the class `L4.Loader`. This class provides interfaces for conveniently configuring and starting programs. It provides three operations:

- `new_channel()` Returns a new IPC gate that can be used to connect two applications
- `start()` and `startv()` Start a new application process and return a process object

The `new_channel()` call is used to provide a service application with a communication channel to bind its initial service to. The concrete behavior of the object and the number of IPC gates required by a server depends on the server implementation. The channel can be passed to client applications as well or can be used for operations within the script itself.

`start()` and `startv()` always require at least two arguments. The first one is a table that contains information about the initial objects an application shall get. The second argument is a string, which for `start()` is the program name plus a white-space-separated list of program arguments (`argv`). For `startv()` the second argument is just the program binary name – which may contain spaces –, and the program arguments are provided as separate string arguments following the binary name (allowing spaces in arguments, too). The last optional argument is a table containing the POSIX environment variables for the program.

The Loader class uses reasonable defaults for most of the initial objects. However, you can override any initial object with some user-defined values. The main elements of the initial object table are:

- `factory` The factory used by the new process to create new kernel objects, such as threads etc. This must be a capability to an object implementing the [L4::Factory](#) protocol and defaults to the factory object provided to Ned.
- `mem` The memory allocator provided to the application and used by Ned allocates data spaces for the process. This defaults to Ned's memory allocator object (see [L4Re::Mem\\_alloc](#)).
- `rm_fab` The generic factory object used to allocate the region-map object for the process. (defaults to Ned's memory allocator).

- `log_fab` The generic factory to create the [L4Re::Log](#) object for the application's output (defaults to Ned's memory allocator). The `create` method of the `log_fab` object is called with `log_tag` and `log_color`, from this table, as arguments.
- `log_tag` The string used for tagging log output of this process (defaults to the program name) (see `log_fab`).
- `log_color` The color used for the log tag (defaults to "white").
- `scheduler` The scheduler object used for the process' threads (defaults to Ned's own scheduler).
- `caps` The table with application-specific named capabilities (default is an empty table). If the table does not contain a capability with the name 'rom', the 'rom' capability from Ned's initial caps is inserted into the table.

The `start()` and `startv()` calls return a task object that supports a number of operations.

- `state()` returns a string with the current task state: "running" or "zombie" if the task has terminated. If the task was already reaped (`wait()` returned) or if `kill()` was called, then the function will return `nil`.
- `exit_code()` returns the exit code if the task has terminated or `nil` if it was either killed or has been reaped.
- `kill()` forcefully terminates the task. Returns "killed" if the task was terminated or the exit code if the task was already gone. Returns `nil` if the task was already reaped.
- `exit_handler(function)` registers a Lua function that is invoked when the task terminates. If the task has already terminated, the function is called immediately. Returns `true` if the callback is pending, otherwise `false`. The callback function gets the exit code (`nil` if killed) of the task as its only parameter. The return value of the function is ignored. Only one callback can be registered.
- `wait()` suspends execution until the task has terminated. It's better to use `exit_handler()` instead. While the Lua code executes `wait()`, no `exit_handler()` will be dispatched.

### 5.3.1.5 Reacting on task termination

Ned can react on the termination of child tasks. The preferred mechanism is to register an `exit_handler()` for a task:

```
task = L4.default_loader:start(...)
task:exit_handler(function(exit_code)
  if exit_code == nil then
    print("Task was killed")
  else
    print("Task has terminated w/ code [" .. exit_code .. "]")
  end
end)
```

If the task did already terminate then the callback is invoked immediately. It is also possible to suspend execution of the Ned script until a task has terminated:

```
task = L4.default_loader:start(...)
task:wait()
```

This method should be used with caution, though. The Ned script will wait until the child task has terminated. Neither will any of the registered `exit_handler()` will be called during this time, nor will the [remote command interface](#) be able to execute commands either.

### 5.3.1.6 Access to the kernel debugger

Applications can enrich the kernel debugger with information using the API defined in [l4/sys/debugger](#). In order to do so, the developer has to assign access to the kernel debugger kernel object to the application. This can be done like this:

```
L4.default_loader:start({ caps = { jdb = L4.Env.jdb; }}, "rom/example")
```

### 5.3.1.7 Using the interactive ned prompt

Ned can be used in interactive mode by connecting the small ned-prompt helper tool to the command capability. Add the following code snippet at the end of your ned script:

```
local L4 = require("L4");
local l = L4.default_loader;

cmd = l:new_channel()

l:start({ log = L4.Env.log, caps = { svr = cmd } }, "rom/ned-prompt")

L4.server_loop(cmd)
```

The script hands in ned's own log capability to `ned-prompt`. This ensures that input and output of ned and the prompt appear on the same console.

`ned-prompt` needs to be added to your modules list.

## 5.3.2 Command Line Options

Ned's command line syntax is:

```
[--exit|--wait-and-exit] [--execute|-e STATEMENT] <lua script> [options passed to lua script]
```

Ned interprets the first non-option argument `<lua script>` as the Lua script which it should load and run. All arguments following the first non-option argument are passed as arguments to the Lua script via Lua's global `arg` table.

- Exit Options: **exit**, **wait-and-exit** (must be first if used)
  - `exit*`: terminates the application after the script has run through even if there are still tasks running. `wait` for tasks at the end of the script to ensure they do not die forcefully.
  - `exit-and-wait**`: terminates the application after the script has run through and all tasks started by ned have signaled their exit.
- Execute Statement Option: **execute**, **e**
  - Execute the Lua statement `STATEMENT`.

## 5.4 Io, the Io Server

The Io server handles all platform devices and resources such as I/O memory, ports (on x86) and interrupts, and grants access to those to clients.

Upon startup Io discovers all platform devices using available means on the system, e.g. on x86 the PCI bus is scanned and the ACPI subsystem initialised. Available I/O resource can also be configured via configuration scripts.

Io's configuration consists of two parts:

- the description of the real hardware
- the description of virtual buses

Both descriptions represent a hierarchical (tree) structure of device nodes. Where each device has a set of resources attached to it. And a device that has child devices can be considered a bus.

## Hardware Description

The hardware description represents the devices that are available on the particular platform including their resource descriptions, such as MMIO regions, IO-Port regions, IRQs, bus numbers etc.

The root of the hardware devices is formed by a system bus device (accessible in the configuration via `lo.system↔_bus()`). As mentioned before, platforms that support methods for device discovery may populate the hardware description automatically, for example from ACPI. On platforms that do not have support for such methods you have to specify the hardware description by hand. A simple example for this is `x86-legacy.devs`.

## Virtual Bus Description

Each lo server client is provided with its own virtual bus which it can iterate to find devices. A virtual PCI bus may be a part of this virtual bus.

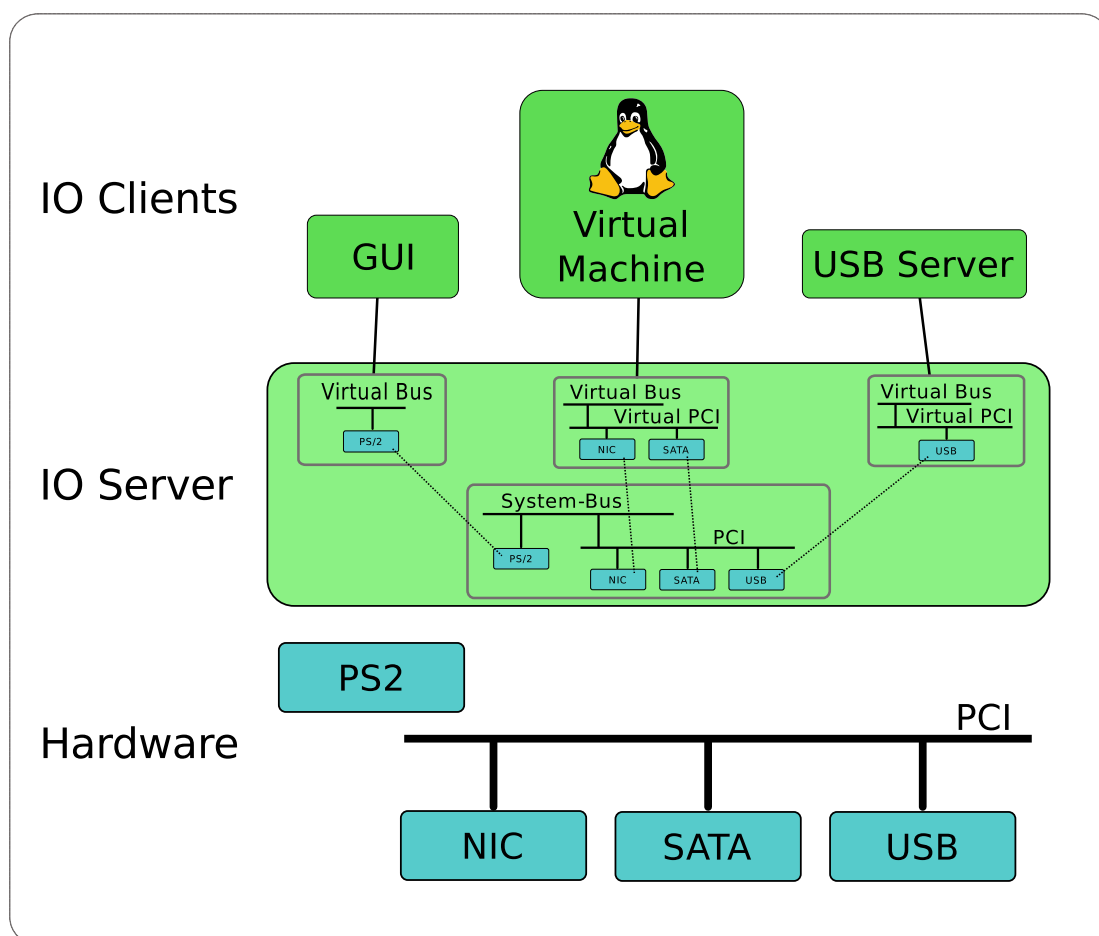

Figure 5.1 IO Service Architecture Overview

The lo server must be configured to create virtual buses for its clients.

This is done with at least one configuration file specifying static resources as well as virtual buses for clients. The configuration may be split across several configuration files passed to lo through the command line.

To allow clients access to available devices, a virtual system bus needs to be created that lists the devices and their resources that should be available to that client. The names of the buses correspond to the capabilities given to lo in its launch configuration.

A very simple configuration for Io could look like this:

```
-- vim:ft=lua
-- Example configuration for io

-- Configure two platform devices to be known to io
Io.Dt.add_children(Io.system_bus(), function()

    -- create a new hardware device called "FOODEVICE"
    FOODEVICE = Io.Hw.Device(function()
        -- set the compatibility IDs for this device
        -- a client tries to match against these IDs and configures
        -- itself accordingly
        -- the list should be sorted from specific to less specific IDs
        compatible = {"dev-foo,mmio", "dev-foo"};

        -- set the 'hid' property of the device, the hid can also be used
        -- as a compatible ID when matching clients
        Property.hid = "dev-foo,Example";

        -- note: names for resources are truncated to 4 letters and a client
        -- can determine the name from the ID field of a l4vbus_resource_t
        -- add two resources 'irq0' and 'reg0' to the device
        Resource.irq0 = Io.Res.irq(17);
        Resource.reg0 = Io.Res.mmio(0x6f000000, 0x6f007fff);
    end);

    -- create a new hardware device called "BARDEVICE"
    BARDEVICE = Io.Hw.Device(function()
        -- set the compatibility IDs for this device
        -- a client tries to match against these IDs and configures
        -- itself accordingly
        -- the list should be sorted from specific to less specific IDs
        compatible = {"dev-bar,mmio", "dev-bar"};

        -- set the 'hid' property of the device, the hid can also be used
        -- as a compatible ID when matching clients
        Property.hid = "dev-bar,Example";

        -- Specify that this device is able to use direct memory access (DMA).
        -- This is needed to allow clients to gain access to DMA addresses
        -- used by this device to directly access memory.
        Property.flags = Io.Hw_device_DF_dma_supported;

        -- note: names for resources are truncated to 4 letters and a client
        -- can determine the name from the ID field of a l4vbus_resource_t
        -- add three resources 'irq0', 'irq1', and 'reg0' to the device
        Resource.irq0 = Io.Res.irq(19);
        Resource.irq1 = Io.Res.irq(20);
        Resource.reg0 = Io.Res.mmio(0x6f100000, 0x6f100fff);
    end);
end);

Io.add_vbusses
{
    -- Create a virtual bus for a client and give access to FOODEVICE
    client1 = Io.Vi.System_bus(function ()
        dev = wrap(Io.system_bus():match("dev-foo,mmio"));
    end);

    -- Create a virtual bus for another client and give it access to BARDEVICE
    client2 = Io.Vi.System_bus(function ()
        dev = wrap(Io.system_bus():match("dev-bar,Example"));
    end);
}
```

Each device supports a 'compatible' property. It is a list of compatibility strings. A client matches itself against one (or multiple) compatibility IDs and configures itself accordingly. All other device members are handled according to their type. If the type is a resource (Io.Res) it is added as a named resource. Note that resource names are truncated to 4 letters and are stored in the ID field of a [l4vbus\\_resource\\_t](#). If the type is a device it is added as a child device to the current one. All other types are treated as a device property which can be used to configure a device driver. Right now, device properties are internal to Io only.

## Matching and Assigning PCI Devices

Assigning clients PCI devices could look like this:

```
-- This is a configuration snippet for PCI device selection

local hw = Io.system_bus();

Io.add_vbusses
```

```

{
  pciclient = Io.Vi.System_bus(function ()
    PCI = Io.Vi.PCI_bus(function ()
      pci_mm      = wrap(hw:match("PCI/CC_04"));
      pci_net     = wrap(hw:match("PCI/CC_02"));
      pci_storage = wrap(hw:match("PCI/CC_01"));
    end)
  end)
}

```

The "PCI/" is followed by a bus-specific ID string. The format of the PCI ID string may be one of the following:

- PCI/CC\_cc
- PCI/CC\_ccss
- PCI/CC\_ccssp
- PCI/VEN\_vvvv
- PCI/DEV\_dddd
- PCI/SUBSYS\_ssssssss
- PCI/REV\_rr
- PCI/ADR\_xxxx:xx:xx.x

Where:

- cc is the hexadecimal representation of the class code byte
- ss is the hexadecimal representation of the subclass code byte
- pp is the hexadecimal representation of the programming interface byte
- vvvv is the hexadecimal representation of the vendor ID
- dddd is the hexadecimal representation of the device ID
- ssssssss is the hexadecimal representation of the subsystem ID
- rr is the hexadecimal representation of the revision byte
- xxxx:xx:xx.x is the bus address in PCI nomenclature

As a special extension lo supports replacing the ID string with a human-readable common PCI class name. The following table gives an overview of the names known to lo and their respective PCI class and subclass.

Common Name	Description	PCI ID string
storage	Mass storage controller	CC_01
scsi	SCSI storage controller	CC_0100
ide	IDE interface	CC_0101
floppy	Floppy disk controller	CC_0102
raid	RAID bus controller	CC_0104
ata	ATA controller	CC_0105
sata	SATA controller	CC_0106
sas	Serial attached SCSI controller	CC_0107
nvm	Non-volatile memory controller	CC_0108
-	-	-
network	Network controller	CC_02
ethernet	Ethernet controller	CC_0200

Common Name	Description	PCI ID string
token_ring	Token ring network controller	CC_0201
fddi	FDDI network controller	CC_0202
atm	ATM network controller	CC_0203
isdn	ISDN controller	CC_0204
picmg	PICMG controller	CC_0206
net_infiniband	Infiniband controller	CC_0207
fabric	Fabric controller	CC_0208
network_nw	Network controller e.g. Wifi	CC_0280
-	-	-
display	Display controller	CC_03
vga	VGA compatible controller	CC_0300
xga	XGA compatible controller	CC_0301
-	-	-
media	Multimedia controller	CC_04
mm_video	Multimedia video controller	CC_0400
mm_audio	Multimedia audio controller	CC_0401
telephony	Computer telephony device	CC_0402
audio	Audio device	CC_0403
-	-	-
bridge	Bridge	CC_06
br_host	Host bridge	CC_0600
br_isa	ISA bridge	CC_0601
br_eisa	EISA bridge	CC_0602
br_microchannel	MicroChannel bridge	CC_0603
br_pci	PCI bridge	CC_0604
br_pcmcia	PCMCIA bridge	CC_0605
br_nubus	NuBus bridge	CC_0606
br_cardbus	CardBus bridge	CC_0607
br_raceway	RACEway bridge	CC_0608
br_semi_pci	Semi-transparent PCI-to-PCI bridge	CC_0609
br_infiniband_to_pci	InfiniBand to PCI host bridge	CC_060a
-	-	-
com	Communication controller	CC_07
com_serial	Serial controller	CC_0700
com_parallel	Parallel controller	CC_0701
com_multiport_ser	Multiport serial controller	CC_0702
com_modem	Modem	CC_0703
com_gpib	GPiB controller	CC_0704
com_smart_card	Smart card controller	CC_0705
-	-	-
serial_bus	Serial bus controller	CC_0c
firewire	FireWire (IEEE 1394)	CC_0c00
access_bus	ACCESS bus	CC_0c01
ssa	SSA	CC_0c02
usb	USB controller	CC_0c03
fibre_channel	Fibre channel	CC_0c04
smbus	SMBus	CC_0c05
bus_infiniband	InfiniBand	CC_0c06
ipmi_smic	IPMI SMIC interface	CC_0c07
sercos	SERCOS interface	CC_0c08

Common Name	Description	PCI ID string
canbus	CAN bus	CC_0c09
-	-	-
wireless	Wireless controller	CC_0d
bluetooth	Bluetooth	CC_0d11
w_8021a	802.1a controller	CC_0d20
w_8021b	802.1b controller	CC_0d21

### Strong Matching of PCI Devices

If more specific matching of PCI devices is required it is possible to concatenate multiple ID strings using `&`. An example where a specific device from a specific vendor at a fixed bus address is matched would use the string `PCI/VEN_vvvv&DEV_dddd&ADR_xxxx:xx:xx.x`.

### Isolation of PCIe devices

PCIe encodes device communication with a network-like protocol with destination headers and packet fragmentation allowing a devices to talk directly to other devices. This potentially works against security boundaries for a system. E.g. two network cards could exchange packets and thereby leak information from one security domain to the other without involvement of the OS.

PCIe introduced an optional capability named PCI Access Control Services (PCI/ACS) to control communication between PCIe devices.

With PCI/ACS it is possible to restrict inter-device communication between PCIe devices.

PCI/ACS is optional and for Intel chipsets, it is usually only implemented on high-end PCI platform controller hubs (PCHs), and is missing on low-end and mobile PCHs. On some Intel-PCHs there exist facilities that allow for similar isolation.

If IO encounters a supported PCH, it will enable those facilities in order to enforce device isolation.

### Command Line Options

The Io Server supports the following optional parameters:

```
[--verbose|v] [--transparent-msi] [--trace <trace_mask>] [--acpi-debug-level <debug_level>] [config_files]
```

- **verbose|v**

By default, error debug messages are enabled. This option increments the verbosity level, and can be applied multiple times to reach the desired debug level. The available debug levels are ordered as: `DBG_ERR` (default, level 1), `DBG_WARN`, `DBG_INFO`, `DBG_DEBUG`, `DBG_DEBUG2` and `DBG_ALL` (level 6).

- **transparent-msi**

Enable MSI on PCI devices which support this feature. This is transparent to clients, as there are no changes in the API used to interact with PCI device via interrupts.

- **acpi-debug-level <level\_mask>**

Set the ACPI debug level. The `<level_mask>` is a mask that selects components of interest for debugging. It can be constructed from the ACPI debug constants defined in the linux kernel, see [ACPI Debug Output](#) for details. By default, the ACPI debug level is set to `ACPI_LV_INIT | ACPI_LV_TABLES | ACPI_LV_VERBOSE_INFO`.

- **trace <trace\_mask>**

Enable tracing of events matching `trace_mask`. The only supported trace mask is 1 and this matches ACPI events.

- **config\_files**

Space separated list of Lua configuration files specifying real hardware and virtual buses. See example on [Virtual Bus Description](#).

## 5.5 AHCI driver

The AHCI driver is a driver for PCI serial ATA host controllers.

The AHCI driver is capable of exposing entire disks (by serial number) or individual partitions (by their partition UUID) of a hard drive to clients via the Virtio block interface.

The driver consists of two parts. The first one is the hardware driver itself that takes care of the communication with the underlying hardware and interrupt handling. The second part implements a virtual block device and is responsible to communicate with clients. The virtual block device translates commands it receives into AHCI requests and issues them to the hardware driver.

The AHCI driver allows both statically and dynamically configured clients. A static configuration is given priority over dynamically connecting clients and configured while the service starts. Dynamic clients can connect and disconnect during runtime of the AHCI driver.

### Building and Configuration

The AHCI driver can be built using the [L4Re](#) build system. Just place this project into your `pkg` directory. The resulting binary is called `ahci-drv`

### Starting the service

The AHCI driver can be started with Lua like this:

```
local ahci_bus = L4.default_loader:new_channel();
L4.default_loader:start({
  caps = {
    vbus = vbus_ahci,
    svr = ahci_bus:svr(),
  },
},
"rom/ahci-drv");
```

First an IPC gate (`ahci_bus`) is created which is used between the AHCI driver and a client to request access to a particular disk or partition. The server-side is assigned to the mandatory `svr` capability of the AHCI driver. See the section below on how to configure access to a disk or partition.

The ahci driver needs access to a virtual bus capability (`vbus`). On the virtual bus the AHCI driver searches for AHCI 1.0 compliant storage controllers. Please see io's documentation about how to setup a virtual bus.

### Options

In the example above the ahci driver is started in its default configuration. To customize the configuration of the ahci-driver it accepts the following command line options:

- `-A`  
Disable check for address width of the device. Only do this if all physical memory is guaranteed to be below 4GB.

- `-v`  
Enable verbose mode. You can repeat this option up to three times to increase verbosity up to trace level.
- `-q`  
This option enables the quiet mode. All output is silenced.
- `--client <cap_name>`  
This option starts a new static client option context. The following `device`, `ds-max` and `readonly` options belong to this context until a new client option context is created.  
The option parameter is the name of a local IPC gate capability with server rights.
- `--device <UUID | SN>`  
This option denotes the partition UUID or serial number of the preceding `client` option.
- `--ds-max <max>`  
This option sets the upper limit of the number of dataspaces the client is able to register with the AHCI driver for virtio DMA.
- `--slot-max <max>`  
This option defines the maximum number of requests a single client may have in parallel running on the device. If a positive number is given, then this is considered the absolute number of slots to be used. If a negative number is given, then the client may use all available slots except the number given. In any case, a client gets at least 1 slot and at most the number of slots available in hardware. This parameter is only valid when a client accesses a partition and ignored otherwise.
- `--readonly`  
This option sets the access to disks or partitions to read only for the preceding `client` option.

## Connecting a client

Prior to connecting a client to a virtual block session it has to be created using the following Lua function. It has to be called on the client side of the IPC gate capability whose server side is bound to the ahci driver.

```
create(obj_type, "device=<UUID | SN>", "ds-max=<max>"[, "slot-max=<max>"])
```

- `obj_type`  
The type of object that should be created by the driver. The type must be a positive integer. Currently the following objects are supported:
  - 0: Virtio block host
- `"device=<UUID | SN>"`  
This string denotes either a partition UUID or a disk serial number the client wants to be exported via the Virtio block interface.
- `"ds-max=<max>"`  
Specifies the upper limit of the number of dataspaces the client is allowed to register with the AHCI driver for virtio DMA.
- `"slot-max=<max>"`  
Specifies the maximum number of requests that will be processed in parallel by the AHCI device. See `--slot-max` option above for details.

If the `create()` call is successful a new capability which references an AHCI virtio driver is returned. A client uses this capability to communicate with the AHCI driver using the Virtio block protocol.

## Examples

A couple of examples on how to request different disks or partitions are listed below.

- Request a partition with the given UUID

```
vda1 = ahci_bus:create(0, "ds-max=5", "device=88E59675-4DC8-469A-98E4-B7B021DC7FBE")
```

- Request complete disk with the given serial number

```
vda = ahci_bus:create(0, "ds-max=4", "device=QM00005")
```

- A more elaborate example with a static client. The client uses the client side of the `ahci_cl1` capability to communicate with the AHCI driver.

```
local ahci_cl1 = L4.default_loader:new_channel();
local ahci_bus = L4.default_loader:new_channel();
L4.default_loader:start({
  caps = {
    vbus = vbus_ahci,
    svr = ahci_bus:svr(),
    cl1 = ahci_cl1:svr(),
  },
},
"rom/ahci-drv --client cl1 --device 88E59675-4DC8-469A-98E4-B7B021DC7FBE --ds-max 5");
```

## 5.6 Cons, the Console Multiplexer

`cons` allows to multiplex console output from different [L4](#) clients to different [L4::Vcon](#)-capable in/output servers.

### Multiplexers and Frontends

`cons` is able to connect multiple clients with multiple in/output servers.

Clients are handled by a *multiplexer*. Each multiplexer publishes a server capability that allows to create new client connections. The default multiplexer is normally known under the `cons` capability.

Actual in/output is handled by separate frontends. From the point-of-view of `cons`, a frontend consists of an IPC channel to a server that speaks an appropriate server protocol. By default the `L4.Env.log` capability is used.

For clients `cons` implements the [L4::Vcon](#) and the Virtio console interface. The supported frontends is limited to [L4::Vcon](#) only.

### Command Line Options

`cons` accepts the following command line switches:

- `-a, --show-all`

Initially show output from all clients.

- `-c <client>, --autoconnect <client>`

Automatically connect to the client with the given name. That means that output of this client will be visible and input will be routed to it.

- `-k, --keep`  
Keep the console buffer when a client disconnects.
- `-l, --no-line-buffering`  
By default, merge the client output to entire lines. If the client writes characters without a final newline, the following client output is merged with the current line content. Specifying this switch disables the line buffered mode by default.
- `--line-buffering-ms <timeout>`  
Timeout in milliseconds before buffered client output is written even without a newline. Default value is 50.
- `-n, --defaultname`  
Default multiplexer capability to use. Default: `cons`.
- `-B <size>, --defaultbufsize <size>`  
Default buffer size per client in bytes. Default: 40960
- `-m <prompt name>, --mux <prompt name>`  
Add a new multiplexer named `<prompt name>`. This is necessary if output should be sent to different frontends.
- `-f <cap>, --frontend <cap>`  
Set the frontend for the current multiplexer. Output for the multiplexer is then sent to the capability with the given name. The server connected to the capability needs to understand the [L4::Vcon](#) protocol.

## Connecting a client

```
create(backend_type, ["client_name"], ["color"], ["options"])
```

- `backend_type`  
The type of backend that should be created for the client. The type is a positive integer and currently the following types are supported:
  - `L4.Proto.Log`: [L4::Vcon](#) client
  - `1`: Virtio console client

## 5.7 Mag, the GUI Multiplexer

Mag is the default multiplexer for graphics hardware.

It is not, and does not attempt to be, a fully-fledged window manager.

### Command Line Options

As Mag's only command line option it supports loading additional plugins via the application's command line. Plugins must be either a Lua file or a shared library. Shared libraries must be named `libmag-$LIBNAME.so`.

## Mag Sessions

Mag provides two types of sessions which a client can create via the Factory interface.

### 1. Mag client session

A client with a mag client session gets access to the whole screen. The client has to allocate and manage its own buffers and has to position them on the screen on its own. Mag provides the factory to create client sessions via the capability named `mag`.

### 2. Client framebuffer session

For a client framebuffer session mag allocates a view of the requested size and displays it at the requested coordinates on the screen. Mag provides the factory to create framebuffer sessions via the capability named `svc`.

The options described below are options the client provides to the `L4::Factory::create()` call. These options influence the appearance and behaviour of the newly created session.

## Session Factory Options

As a simple nitpicker clone Mag supports the so-called Xray mode. This mode displays all session labels and draws a colored frame around them. The session that currently has the input focus is highlighted. The Xray mode is activated via the special keys *Scroll* or *NEXTSONG*.

Mag allows to define a text label and a color for all client session types. The label and the color are displayed when Mag enters the Xray mode.

- Label Option: **label**

`l=LABEL, label=LABEL` Set the session's text label to LABEL. The label is restricted to a length of 256 characters.

- Color Option: **col**

`col=COLOR` Set the session's color which is used in Xray mode to tint the session's screen area and the border drawn around it. The argument can be either one of the following letters or a hexadecimal representation of the RGB values.

- `r`, `R` Red color
- `g`, `G` Green color
- `b`, `B` Blue color
- `w`, `W` White color
- `y`, `Y` Yellow color
- `v`, `V` Magenta color

## Example

```
-- set label to "Linux" and use a light blue color
fb = mag_client:create(L4.Proto.Goos, "l=Linux", "col=98d9ff");
```

## Mag Client Session Options

These options only apply to Mag client sessions.

- Default Background Option: **default-background**  
`dfl-bg, default-background` Marks this session as the default background.

## Mag Client Framebuffer Session Options

These options only apply to Mag client framebuffer sessions.

- Geometry Option: **geometry**  
`g=GEOMETRY, geometry=GEOMETRY` Set the session's geometry and position on the screen. GEOMETRY is provided in an X11-style format, e.g. `g=WIDTHxHEIGHT+X_OFFSET+Y_OFFSET`.
- Focus Option: **focus**  
`focus` Set the focus to this session.
- Collapsed Option: **shaded**  
`shaded` The window is collapsed and only the title bar is visible. The window can be expanded by clicking into the title bar with the middle mouse button. Collapsing and expanding works also independently of this option.
- Fixed Option: **fixed** `fixed` The window cannot be moved on the screen.
- Barheight Option: **barheight**  
`barheight=X` Set the height of the title bar in pixels.

### Example

```
-- create a window of 640x480 pixels at position (100,100) on the screen.
fb = mag_fb:create(L4.Proto.Goos, "g=640x480+100+100");
```

## 5.8 NVMe server

The NVMe server is a driver for PCI Express NVMe controllers.

The NVMe server is capable of exposing entire disks (i.e. NVMe namespaces) (by serial number and namespace identifier) or individual partitions (by their partition UUID) of a hard drive to clients via the Virtio block interface.

The server consists of two parts. The first one is the hardware driver itself that takes care of the communication with the underlying hardware and interrupt handling. The second part implements a virtual block device and is responsible to communicate with clients. The virtual block device translates commands it receives into NVMe requests and issues them to the hardware driver.

The NVMe server allows both statically and dynamically configured clients. A static configuration is given priority over dynamically connecting clients and configured while the service starts. Dynamic clients can connect and disconnect during runtime of the NVMe server.

## Building and Configuration

The NVMe server can be built using the [L4Re](#) build system. Just place this project into your `pkg` directory. The resulting binary is called `nvme-drv`

## Starting the service

The NVMe server can be started with Lua like this:

```
local nvme_bus = L4.default_loader:new_channel();
L4.default_loader:start({
  caps = {
    vbus = vbus_nvme,
    svr = nvme_bus:svr(),
  },
},
"rom/nvme-drv");
```

First an IPC gate (`nvme_bus`) is created which is used between the NVMe server and a client to request access to a particular disk or partition. The server-side is assigned to the mandatory `svr` capability of the NVMe server. See the section below on how to configure access to a disk or partition.

The NVMe server needs access to a virtual bus capability (`vbus`). On the virtual bus the NVMe server searches for NVMe compliant storage controllers. Please see `io`'s documentation about how to setup a virtual bus.

## Options

In the example above the NVMe server is started in its default configuration. To customize the configuration of the NVMe-server it accepts the following command line options:

- `-v`  
Enable verbose mode. You can repeat this option up to three times to increase verbosity up to trace level.
- `-q`  
This option enables the quiet mode. All output is silenced.
- `--client <cap_name>`  
This option starts a new static client option context. The following `device`, `ds-max` and `readonly` options belong to this context until a new client option context is created.  
The option parameter is the name of a local IPC gate capability with server rights.
- `--device <UUID | SN:n<NAMESPACE_ID>>`  
This option denotes the partition UUID or serial number of the preceding `client` option followed by a colon, letter 'n' and the identifier of the requested NVMe namespace.
- `--ds-max <max>`  
This option sets the upper limit of the number of dataspace the client is able to register with the NVMe server for virtio DMA.
- `--readonly`  
This option sets the access to disks or partitions to read only for the preceding `client` option.

- `--nosgl`  
This option disables support for SGLs.
- `--noms`  
This option disables support for MSI interrupts.
- `--nomsix`  
This option disables support for MSI-X interrupts.
- `-d <cap_name>, --register-ds <cap_name>` This option registers a trusted dataspace capability. If this option gets used, it is not possible to communicate to the driver via dataspaces other than the registered ones. Can be used multiple times for multiple dataspaces.  
The option parameter is the name of a dataspace capability.

## Connecting a client

Prior to connecting a client to a virtual block session it has to be created using the following Lua function. It has to be called on the client side of the IPC gate capability whose server side is bound to the NVMe server.

```
create(obj_type, "device=<UUID | SN:n<NAMESPACE_ID>>", "ds-max=<max>", "read-only")
```

- `obj_type`  
The type of object that should be created by the server. The type must be a positive integer. Currently the following objects are supported:
  - 0: Virtio block host
- `"device=<UUID | SN>"`  
This string denotes either a partition UUID, or a disk serial number the client wants to be exported via the Virtio block interface followed by a colon, letter 'n' and the identifier of the requested NVMe namespace.
- `"ds-max=<max>"`  
Specifies the upper limit of the number of dataspaces the client is allowed to register with the NVMe server for virtio DMA.
- `"read-only"`  
This string sets the access to disks or partitions to read only for the client.

If the `create()` call is successful a new capability which references an NVMe virtio device is returned. A client uses this capability to communicate with the NVMe server using the Virtio block protocol.

## Examples

A couple of examples on how to request different disks or partitions are listed below.

- Request a partition with the given UUID  

```
vda1 = nvme_bus:create(0, "ds-max=5", "device=88E59675-4DC8-469A-98E4-B7B021DC7FBE")
```
- Request complete namespace with the given serial number  

```
vda = nvme_bus:create(0, "ds-max=4", "device=1234:n1")
```

- A more elaborate example with a static client. The client uses the client side of the `nvme_cll` capability to communicate with the NVMe server.

```
local nvme_cll = L4.default_loader:new_channel();
local nvme_bus = L4.default_loader:new_channel();
L4.default_loader:start({
  caps = {
    vbus = vbus_nvme,
    svr = nvme_bus:svr(),
    cll = nvme_cll:svr(),
  },
},
"rom/nvme-drv --client cll --device 88E59675-4DC8-469A-98E4-B7B021DC7FBE --ds-max 5");
```

## 5.9 Uvmm, the virtual machine monitor

Uvmm provides a virtual machine for running an unmodified guest in non-privileged mode.

### Command Line Options

uvmm provides the following command line options:

- `-c, --cmdline=<guest command line>`  
Command line that is passed to the guest on boot.
- `-k, --kernel=<kernel image name>`  
The name of the guest-kernel image file present in the ROM namespace.
- `-d, --dtb=<DTB overlay>`  
The name of the device tree file present in the ROM namespace. The device tree will be placed in the upmost region of guest memory. Optionally, a user may use an additional parameter in the form of "`<DTB overlay>:limit=0xffffffff`" to set an upper limit for the device tree location.
- `-r, --ramdisk=<RAM disk name>`  
The name of the RAM disk file present in the ROM namespace
- `-b, --rambase=<Base address of the guest RAM>`  
Physical start address for the guest RAM. This value is platform specific.
- `-D, --debug=[<component>=] [level]`  
Control the verbosity level of the uvmm. Possible `level` values are: `quiet`, `warn`, `info`, `trace`  
Using the `component` prefix, the verbosity level of each uvmm component is configurable. The component names are: `core`, `cpu`, `mmio`, `irq`, `dev`, `pm`, `vbus_event`  
For example, the following command line sets the verbosity of all uvmm components to `info` except for IRQ handling, which is set to `trace`.  

```
uvmm -D info -D irq=trace
```
- `-f, --fault-mode`  
Control the handling of guest reads/writes to non-existing memory. Possible values are:
  - `ignore` - Invalid writes are ignored. Invalid reads either return 0 or are skipped. The guest may experience undefined behaviour.
  - `halt` - Halt the VM on the first invalid memory access.

- `inject` - Try to forward the invalid access to the guest. This is not supported on all architectures. Falls back to `halt` if the error could not be forwarded to the guest.

Defaults to `ignore`.

- `-q, --quiet`  
Silence all uvmm output.
- `-v, --verbose`  
Increase the verbosity of the uvmm. Repeating the option increases the verbosity by another level.
- `-W, --wakeup-on-system-resume`  
When set, the uvmm resumes when the host system resumes after a suspend call.
- `-i`  
When set, the option forces the guest RAM to be mapped to its corresponding host-physical addresses.

### Setting up guest memory

In the most simple setup, memory for the guest can be provided via a simple dataspace. In your ned script, create a new dataspace of the required size and hand it into uvmm as the `ram` capability:

```
local ramds = L4.Env.user_factory:create(L4.Proto.Dataspace, 60 * 1024 * 1024)
L4.default_loader::startv({caps = {ram = ramds:m("rw")}}, "rom/uvmm")
```

The memory will be mapped to the most appropriate place and a memory node added to the device tree, so that the guest can find the memory.

For a more complex setup, the memory can be configured via the device tree. uvmm scans for memory nodes and tries to set up the memory from them. A memory device node should look like this:

```
memory@0 {
    device_type = "memory";
    reg = <0x00000000 0x00100000
          0x00200000 0xffffffff>;
    l4vmm,dscap = "memcap";
    dma-ranges = <>;
};
```

The `device_type` property is mandatory and needs to be set to `memory`.

`l4vmm,dscap` contains the name of the capability containing the dataspace to be used for the RAM. `reg` describe the memory regions to use for the memory. The regions will be filled up to the size of the supplied dataspace. If they are larger, then the remaining area will be cut.

If the optional `dma-ranges` property is given, the host-physical address ranges for the memory regions will be added here. Note that the property is not cleared first, so it should be left empty.

For more details see [RAM configuration](#).

## Memory layout

uvmm populates the RAM with the following data:

- kernel binary
- (optional) ramdisk
- (optional) device tree

The kernel binary is put at the predefined address. For ELF binaries, this is an absolute physical address. If the binary supports relative addressing, the binary is put to the requested offset relative to beginning of the first 'memory' region defined in the device tree.

The ramdisk and device tree are placed as far as possible to the end of the regions defined in the first 'memory' node.

If there is a part of RAM that must remain empty, then define an extra memory node for it in the device tree. uvmm only writes to memory in the first memory node it finds.

Warning: uvmm does not touch any unpopulated memory. In particular, it does not ensure that the memory is cleared. It is the responsibility of the provider of the RAM dataspace to make sure that no data leakage can happen. Normally this is not an issue because dataspaces are guaranteed to be cleaned when they are newly created but users should be careful when reusing memory or dataspaces, for example, when restarting the uvmm.

## Forwarding hardware resources to the guest

Hardware resources must be specified in two places: the device tree contains the description of all hardware devices the guest could see and the Vbus describes which resources are actually available to the uvmm.

The vbus allows the uvmm access to hardware resources in the same way as any other [L4](#) application. uvmm expects a capability named 'vbus' where it can access its hardware resources. It is possible to leave out the capability for purely virtual guests (Note that this is not actually practical on some architectures. On ARM, for example, the guest needs hardware access to the interrupt controller. Without a 'vbus' capability, interrupts will not work.) For information on how to configure a vbus, see the [IO documentation](#).

The device tree needs to contain the hardware description the guest should see. For hardware devices this usually means to use a device tree that would also be used when running the guest directly on hardware.

On startup, uvmm scans the device tree for any devices that require memory or interrupt resources and compares the required resources with the ones available from its vbus. When all resources are available, it sets up the appropriate forwarding, so that the guest now has direct access to the hardware. If the resources are not available, the device will be marked as 'disabled'. This mechanism allows to work with a standard device tree for all guests in the system while handling the actual resource allocation in a flexible manner via the vbus configuration.

The default mechanism assigns all resources 1:1, i.e. with the same memory address and interrupt number as on hardware. It is also possible to map a hardware device to a different location. In this case, the assignment between vbus device and device tree device must be known in advance and marked in the device tree using the `l4vmm, vbus-dev` property.

The following device will for example be bound with the vbus device with the HID 'l4-test,dev':

```
test@e0000000 {
    compatible = "memdev,bar";
    reg = <0 0xe0000000 0 0x50000>,
        <0 0xe1000000 0 0x50000>;
    l4vmm,vbus-dev = "l4-test,dev";
    interrupts-extended = <&gic 0 139 4>;
};
```

Resources are then matched by name. Memory resources in the vbus must be named `reg0` to `reg9` to match against the address ranges in the device tree `reg` property. Interrupts must be called `irq0` to `irq9` and will be matched against `interrupts` or `interrupts-extended` entries in the device tree. The vbus must expose resources for all resources defined in the device tree entry or the initialisation will fail.

An appropriate IO entry for the above device would thus be:

```
MEM = Io.Hw.Device(function()
    Property.hid = "l4-test,dev"
    Resource.reg0 = Io.Res.mmio(0x41000000, 0x4104ffff)
    Resource.reg1 = Io.Res.mmio(0x42000000, 0x4204ffff)
    Resource.irq0 = Io.Res.irq(134);
end)
```

Please note that HIDs on the vbus are not necessarily unique. If multiple devices with the HID given in `l4vmm,vbus-dev` are available on the vbus, then one device is chosen at random.

If no vbus device with the given HID is available, the device is disabled.

## How to enable guest suspend/resume

### Note

Currently only supported on ARM. It should work fine with Linux version 4.4 or newer.

Uvmm (partially) implements the power state coordination interface (PSCI), which is the standard ARM power management interface. To make use of this interface, you have to announce its availability to the guest operating system via the device tree like so:

```
psci {
    compatible = "arm,psci-0.2";
    method = "hvc";
};
```

The Linux guest must be configured with at least these options:

```
CONFIG_SUSPEND=y
CONFIG_ARM_PSCI=y
```

## How to communicate power management (PM) events

Uvmm can be instructed to inform a PM manager of PM events through the [L4::Platform\\_control](#) interface. To that end, uvmm may be equipped with a `pfc` cap. On suspend, uvmm will call [l4\\_platform\\_ctl\\_system\\_suspend\(\)](#).

The `pfc` cap can also be implemented by IO. In that case the guest can start a machine suspend/shutdown/reboot.

### Ram block device support

The example ramdisk works by loading a file system into RAM, which needs RAM block device support to work. In the Linux kernel configuration add: `CONFIG_BLK_DEV_RAM=y`

### Framebuffer support for uvmm/amd64 guests

Uvmm can be instructed to pass along a framebuffer to the Linux guest. To enable this three things need to be done:

1. Configure Linux to support a simple framebuffer by enabling `CONFIG_FB_SIMPLE=y` `CONFIG_X86_`  
`SYSFB=y`
2. Configure a simple framebuffer device in the device tree (currently only read by uvmm, linearer framebuffer at [0xf0000000 - 0xf1000000])  

```
simplefb { compatible = "simple-framebuffer"; reg = <0x0 0xf0000000 0x0 0x1000000>; l4vmm,fbcap = "fb";
};
```
3. Start a framebuffer instance and connect it to uvmm e.g. – Start fb-drv (but only if we need to) local `fbdrv_fb`  
`= L4.Env.vesa;` if (not `fbdrv_fb`) then `fbdrv_fb = l:new_channel(); l:start({ caps = { vbus = io_busses.fbdrv, fb`  
`= fbdrv_fb:svr(), }, log = { "fbdrv", "r" }, }, "rom/fb-drv"); end vmm.start_vm{ ext_caps = { fb = fbdrv_fb }, – ...`

### Requirements on the Fiasco.OC configuration on amd64

The kernel configuration must feature `CONFIG_SYNC_TSC=y` in order for the emulated timers to reach a sufficiently high resolution.

### Recommended Linux configuration options for uvmm/amd64 guests

The following options are recommended in addition to the amd64 defaults provided by a `make defconfig`:

Virtio support is required to access virtual devices provided by uvmm:

```
CONFIG_VIRTIO=y
CONFIG_VIRTIO_PCI=y
CONFIG_VIRTIO_BLK=y
CONFIG_BLK_MQ_VIRTIO=y
CONFIG_VIRTIO_CONSOLE=y
CONFIG_VIRTIO_INPUT=y
CONFIG_VIRTIO_NET=y
```

It is highly recommended to use the X2APIC, which needs virtualization awareness to work under uvmm:

```
CONFIG_X86_X2APIC=y
CONFIG_PARAVIRT=y
CONFIG_PARAVIRT_SPINLOCKS=y
```

### KVM clock for uvmm/amd64 guests

When executing L4Re + uvmm on QEMU, the PIT as clock source is not reliable. The paravirtualized KVM clock provides the guest with a stable clock source.

A KVM clock device is available to the guest, if the device tree contains the corresponding entry:

```
kvm_clock {
    compatible = "kvm-clock";
    reg = <0x0 0x0 0x0 0x0>;
};
```

To make use of this clock, the Linux guest must be built with the following configuration options:

```
CONFIG_HYPERVISOR_GUEST=y
CONFIG_KVM_GUEST=y
CONFIG_PTP_1588_CLOCK_KVM is not set
```

Note: KVM calls besides the KVM clock are unhandled and lead to failure in the uvmm, e.g. vmcall 0x9 for the PTP\_1588\_CLOCK\_KVM.

This is considered a development feature. The KVM clock is not required when running on physical hardware as TSC calibration via the PIT works as expected.

### Development notes for amd64

When you are developing on Linux using QEMU please note that nested virtualization support is necessary on your host system to run uvmm guests. Your host Linux version should be 4.12 or greater, **excluding 4.20**.

Check if your KVM module has nested virtualization enabled via:

```
> cat /sys/module/kvm_intel/parameters/nested
Y
```

In case it shows N instead of Y enable nested virtualization support via:

```
modprobe kvm_intel nested=1
```

On AMD platforms the module name is `kvm_amd`.

### QEMU network setup for a uvmm guest on amd64

```
qemu-system-x86_64 -M q35 -cpu host -enable-kvm -device intel-iommu -device e1000e,netdev=net0 -netdev bridge,id=net0,br=virbr0
```

where 'virbr0' is the name of the host's bridge device. The line 'allow virbr0' needs to be present in /etc/qemu/bridge.conf. The bridge can either be created via the network manager or via the command line↵:

```
brctl addbr virbr0
ip addr add 192.168.124.1/24 dev virbr0
ip link set up dev virbr0
```

In the guest linux with eth0 as network device:

```
ip a a 192.168.124.5/24 dev eth0
ip li se up dev eth0
```

Now the host and guest can ping each other using their respective IPs.

Of course, uvmm needs to be connected to io and io needs a vbus configuration for the uvmm client like this:

```
Io.add_vbusses
{
  vm_pci = Io.Vi.System_bus(function ()
    Property.num_msis = 6
    PCI = Io.Vi.PCI_bus(function ()
      pci_net = wrap(Io.system_bus():match("PCI/CC_0200"))
    end)
  end)
}
```

### QEMU emulated VirtIO devices and IO-MMU on amd64

QEMU does not route VirtIO devices through the IO-MMU per default. To use QEMU emulated VirtIO devices add the `disable-legacy=on,disable-modern=off,iommu_platform=on` flags to the option list of the device. The e1000e card in the network example above can be replaced with an virtio-net-pci card like this:

```
-device virtio-net-pci,disable-legacy=on,disable-modern=off,
      iommu_platform=on,netdev=net0
```

For more information on VirtIO devices and their options see <https://wiki.qemu.org/Features/VT-d>.

### Using the uvmm monitor interface

Uvmm implements an interface with which parts of the guest's state can be queried and manipulated at runtime. This monitor interface needs to be enabled during compilation as well as during startup of uvmm. This is described in detail below.

## Compiling uvmm with monitor interface support

To compile uvmm with monitor interface support pass the `CONFIG_MONITOR=y`, option during the `make` step (or set in in the `Makefile.config`). This option is available on all architectures but note that the set of available monitor interface features may vary significantly between them. Also note that the monitor interface will always be disabled in release mode, i.e. if `CONFIG_RELEASE_MODE=y`.

## Enabling the monitor interface at runtime

When starting a uvmm instance from inside a `ned` script using the `vmm.start_vm` function, the `mon` argument controls whether the monitor interface is enabled at runtime. There are three cases to distinguish:

- `mon=true` (default): The monitor interface is enabled but no server implementing the client side of the monitor interface is started. The monitor interface can still be utilized via `cons` but no readline functionality will be available.
- `'mon=some_binary'`: If a string is passed as the value of `mon`, the monitor interface is enabled and the string is interpreted as the name of a server binary which implements the client side of the monitor interface. This server is automatically started and has access to a `vcon` capability named `mon` at startup through which it can make use of the monitor interface. Unless you have written your own server you should specify `'uvmm_cli'` which is a server implementing a simple readline interface.
- `mon=false`: The monitor interface is disabled at runtime.

## Using the monitor interface

If the monitor interface was enabled you can connect to it via `cons` under the name `mon<n>` where `<n>` is a unique integer for every uvmm instance that is started with the monitor interface enabled (numbered starting from one in order of corresponding `vmm.start_vm` calls). If `'mon=uvmm_cli'` was specified, readline functionality such as command completion and history will be available. Enter a command followed by `enter` to run that command. To obtain a list of all available commands issue the `help` command, to obtain usage information for a specific command `foo` issue `help foo`.

### Note

Some commands will modify the guests state. Since it should be obvious to which ones this applies this is usually not specifically highlighted. Exercise reasonable caution.

## Using the guest debugger

The guest debugger provides monitoring functionality akin to a very bare-bone GDB interface, e.g. guest RAM and page table dumping, breakpointing and single stepping. Additional functionality might be added in the future.

### Note

The guest debugger is currently still under development. The guest debugger may also not be available on all architectures. To check whether the guest debugger is available check if `help dbg` returns usage information.

If the guest debugger is available, you have to manually load it at runtime using the monitor interface. This saves resources if the guest debugger is not used. To enable the guest debugger, issue the `dbg on` monitor command. Once enabled, the guest debugger can not be disabled again.

To list available guest debugger subcommands, issue `dbg help` after `dbg on`.

### Note

When using SMP, most guest debugger subcommands require you to explicitly specify a guest vcpu using an index starting from zero.

### 5.9.1 RAM configuration

#### RAM configuration for uvmm

##### Without a memory node in the device tree

- setup default RAM for guest VM.
- RAM starts either
  - at base-address which defaults to 0x0 or the base address value set via the -b cmdline option or
  - in case of identity mapping at the host-physical address of the dataspace allocated for the RAM

##### With a memory node in the device tree

The memory node needs at least the properties `device_type` and `l4vmm,dscap`:

```
memory@0 {  
    device_type = "memory";  
    l4vmm,dscap = "ram";  
}
```

Where the given `l4vmm,dscap` name is accessible in the capability namespace of the uvmm. If the capability is invalid, the memory node is disabled.

If memory nodes are given, but none provides valid RAM the configuration is invalid and uvmm refuses to boot.

Additional properties of the memory node are `reg` and `dma-ranges`.

The `reg` property describes the location in the guest's address space that should be backed by RAM.

The `dma-ranges` property describes the offset between guest-physical and host-physical addresses. The guest can evaluate this non-standard property to derive the correct DMA addresses to program into passed-through devices. Usage of this property **requires** modification of guest code.

##### Without `reg` and `dma-ranges` properties

The `reg` property is optional only in case the uvmm maps the guest's RAM into the VM under the host-physical addresses of the backing memory (`l4vmm,dscap`).

This case can be forced via the cmdline parameter `-i` and is the default for platforms without IOMMU, but with DMA capable devices on the configured vBus.

##### Without a `reg` property, but with a `dma-ranges` property

If the `-i` cmdline parameter is given, identity mapping is forced and the behavior is the same as in the case above. Additionally, the `dma-ranges` property is written

In case no `-i` cmdline parameter is given, the configuration is invalid and uvmm refuses to boot.

### With a reg property

uvmm parses the reg property of the memory node and maps the memory into the VM to the given range(s).

If the -i cmdline parameter is set, the reg property is ignored and the memory is mapped into the VM under the corresponding host-physical addresses of the backing memory (l4vmm,dscap)

### With a reg and dma-ranges property

uvmm parses the reg property of the memory node and maps the memory into the VM to the given range(s).

The dma-ranges property is filled with the corresponding host-physical addresses of the backing memory (l4vmm,dscap).

## 5.10 l4vio\_net\_p2p, a virtual network point-to-point link

The virtual network point-to-point server (p2p) connects two clients with a virtual network connection.

It uses virtio as the transport mechanism. Each virtual network p2p endpoint implements the device-side of a virtio network device. Each client can access its endpoint using the driver-side semantics of a virtio network device.

### Building and Configuration

The virtual network p2p server can be built using the [L4Re](#) build system by placing this project into the `pkg` directory.

### Starting the service

The virtual network p2p server can be started with Lua like this:

```
local p2p = L4.default_loader:new_channel();
L4.default_loader:start(
{
  caps = {
    svr = p2p:svr(),
  },
},
"rom/l4vio_net_p2p [<options>]");
```

First an IPC gate (p2p) is created which is used between the virtual network p2p server and a client to create new virtual ports. The server-side is assigned to the mandatory `svr` capability of the virtual network p2p server. See the section below on how to create a new virtual port and connect a client to it.

### Options

The following command line options are supported:

- `-p <num_usec>,--poll <num_usec>`  
Enable polling mode and set the poll interval. IRQ notification is disabled for queues while in polling mode. Must be a positive integer specified in microseconds.
- `-s <num>,--size <num>`  
Set the maximum queue size for the device-side virtio queues. Must be a power of 2 in the range of 1 to 32768 inclusive.

## Connecting a client

Prior to connecting a client to a virtual network p2p server port it has to be created using the following Lua function. It has to be called on the client side of the IPC gate capability whose server side is bound to the virtual network p2p server.

The "key=value" pairs passed to create() can be omitted and their order is not important.

```
create(obj_type, ["ds-max=<max>" , "mac-addr=<mac_address>"])
```

- obj\_type

The type of object that should be created by the server. The type must be a positive integer. Currently the following objects are supported:

- 0: Virtual p2p port

- "ds-max=<max>"

Specifies the upper limit of the number of dataspaces the client is allowed to register with the server for virtio DMA. Must be in the range of 1 to 80 inclusive. The default value is 2.

- "mac-addr=<mac\_address>"

Specify the MAC address of the endpoint where <mac\_address> is of the form X:XX:Xx:x:xx:xX.

If the create() call is successful a new capability which references a virtual network p2p server port is returned. A client uses this capability to talk to the virtual network p2p server using the virtio network protocol.

A couple of examples on how to create ports with different properties are listed below.

```
-- two normal ports with at most 4 data spaces
net0 = p2p:create(0, "ds-max=4")
net1 = p2p:create(0, "ds-max=4")
-- normal port with 4 data spaces and MAC address
net0 = p2p:create(0, "ds-max=4", "mac-addr=11:22:33:44:55:66")
```

## Chapter 6

# Bootstrap, the L4 kernel bootstrapper

### Bootstrap Command Line Options

`bootstrap` and the kernel can be configured through command line switches. `bootstrap` is responsible for parsing both command lines: `bootstrap` options are the ones directly given to `bootstrap`, whereas kernel options are those directly given to the kernel, respectively.

When using Multiboot boot, the first module directly after `bootstrap` is considered the kernel: An example using GRUB2 might look like this:

```
multiboot /path/to/bootstrap bootstrap -bs-boolean-opt -bs-opt-with-argument=foo
module /path/to/fiasco fiasco -kernel-opt-with-argument=bar -kernel-boolean-opt
```

#### Note

The exact way to provide the command line to `bootstrap` is platform-dependent. On platforms supporting booting via Multiboot Specification the command line can be specified in the boot configuration (currently x86/amd64 only, e.g. using GRUB) whereas other platforms need the command line to be compiled into the `bootstrap` binary.

Platforms utilising flattened device trees usually also allow specifying a command line through the DT. This mechanism is **not** currently supported in `bootstrap`!

#### Note

`bootstrap` will ignore options it does not understand. For most cases, this also holds true if an option's arguments cannot be understood.

## bootstrap options

Command line options directly understood by `bootstrap` itself are as follows (passed via `bootstrap` command line):

- `-comirq=<irqno>` (x86/amd64 only)

If serial logging is enabled (default on), `<irqno>` defines which IRQ to use for serial port communication. This option is ignored if `-noserial` is also specified (see below).

- `-comport=<portspec>` (x86/amd64 only)

If serial logging is enabled (default on), `<portspec>` defines which serial port to use, being one of:

- `<number>`  
Use legacy port `<number>`, e.g. use `-comport=1` for the port commonly known as *COM1*, or
- `pci:<card>:<port>`  
Use serial port number `<port>` at PCI card number `<card>`, e.g. use `-comport=pci:0:1` for the second port on the first PCI card.
- `pci:probe`  
Use this to have `bootstrap` autodiscover all PCI serial lines. On each discovered line a message will be displayed, telling the correct `<portspec>` to be given to use the respective line.

### Note

`bootstrap` does not support specifying the serial port's baudrate and always uses 115200 bps.

- `-noserial`

Disable serial logging.

- `-wait`

Wait for key press at early startup.

### Note

This is not to be confused with the kernel's `-wait` option, see below.

- `-maxmem=<mbytes>`

Limit the available memory to at most `<mbytes>` MiB.

- `-mem=<size>@<offset>`

Add a region of memory of `<size>` at `<offset>` to the system's memory map. Both `<size>` and `<offset>` may be suffixed by either G, M, or K/k to denote GiB, MiB, or KiB, respectively.

This option may be specified multiple times. If the option is not given, a platform-specific method for determining the memory layout will be used, if available.

- `-presetmem=<intval>`

Initialise memory regions with `<intval>` before starting the kernel.

- `-modaddr=<paddr>`

Relocate modules to the physical address `<paddr>`. Use this when utilising a version of GRUB that lacks support for the `modaddr` command.

## Kernel Options

Command line options for the kernel (passed on kernel command line, i.e. to first module) `bootstrap` understands are as follows.

### Note

Availability of individual options might depend on used platform and/or actual kernel configuration.

- `-wait`  
Enter debugger directly after startup, prior to executing any task.
- `-serial_esc`  
Enable entering the debugger over serial line by pressing `Esc`.
- `-noserial`  
Disable serial logging.

### Note

If this is given as kernel command line argument, it does not affect `bootstrap` but only the kernel.

- `-noscreen`  
Disable VGA console.
- `-esc`  
Enable entering the debugger by pressing `Esc` on attached keyboard.
- `-nojdb`  
Disable the kernel debugger.
- `-nohlt`  
Enable quirk for broken HLT instruction.
- `-apic`  
Use Advanced Programmable Interrupt Controller (APIC) if available and known to be well-behaving.
- `-loadcnt`  
Use load counter for performance counting.
- `-watchdog`  
Enable watchdog timer.
- `-irq0`  
Allow IRQ 0 to be used by userland. This enables some sanity checks to ensure IRQ 0 is not used by the kernel, e.g. for profiling or scheduling purposes. This only has an effect on x86.
- `-nosfn`  
Disable SFN (special fully nested) mode of interrupt controller. This only has an effect on x86 with PIC8259 interrupt controller.
- `-jdb_never_stop`  
Prevent system from stopping to enter JDB. This only has an effect on x86.
- `-kmemsize=<kbytes>`  
Reserve `<kbytes>` KiB of memory for the kernel.

- `-tbuf_entries=<number>`  
Specify the `<number>` of trace buffer entries.
- `-out_buf=<length>`  
Specify length of console buffer to be `<length>` bytes.
- `-jdb_cmd=<ctrlseq>`  
Execute JDB command sequence `<ctrlseq>` right after start-up. If `-wait` is also given, `<ctrlseq>` is executed right before entering JDB.

## Module options

Bootstrap supports module attributes for `sigma0` and the `roottask`. They need to be specified in `modules.list`, e.g.:

```
sigma0[attr:nodes=4-7] ...
```

Attributes are not supported when using multi-boot on platforms that support it. The following attributes are supported:

- `nodes`

This is a colon separated list of AMP node ranges. A range can also be a single number. Examples:

- `nodes=1` – Only node 1
- `nodes=1-3` – Nodes 1 to 3 (inclusive)
- `nodes=0:2-3` – Nodes 0, 2 and 3

If not present, the `sigma0/roottask` module is applicable to all AMP nodes.

- `reloc`

Normally the `sigma0` or `roottask` images are loaded at the preferred load address if the RAM is available at the desired location. If this is not possible, they will be relocated to some free RAM region. Setting the "reloc" module attribute to a non-empty string will always request the dynamic relocation.

This attribute can be used on no-MMU systems to maximize the size of contiguous free RAM regions.

# Chapter 7

## Deprecated List

### Struct [L4::Irq\\_mux](#)

IRQ muxer objects are no longer supported by the kernel.

### Global [L4\\_CAP\\_SIZE](#)

Superseded by [L4\\_CAP\\_OFFSET](#).

### Global [l4\\_irq\\_mux\\_chain](#) ([l4\\_cap\\_idx\\_t](#) irq, [l4\\_cap\\_idx\\_t](#) slave) [L4\\_NOTHROW](#)

IRQ muxer objects are no longer supported by the kernel.

### Global [l4\\_kip\\_clock\\_lw](#) ([l4\\_kernel\\_info\\_t](#) const \*kip) [L4\\_NOTHROW](#)

Use [l4\\_kip\\_clock\(\)](#) instead.

### Global [L4\\_SYSF\\_NONE](#)

Default flags (call to a kernel object).

Using this value as flags in the capability selector for an invocation indicates a call (send and wait for a reply).

### Global [L4Re::Util::Registry\\_server](#) < [LOOP\\_HOOKS](#) > ::[Registry\\_server](#) ([l4\\_utcb\\_t](#) \*, [L4::Cap](#) < [L4::Thread](#) > server, [L4::Cap](#) < [L4::Factory](#) > factory)

Note that this variant of the constructor is deprecated, please do not supply the UTCB pointer, it's not used.

### Global [l4util\\_kip\\_for\\_each\\_feature](#) (s)

Use [l4\\_kip\\_for\\_each\\_feature\(\)](#).

### Global [l4util\\_kip\\_kernel\\_has\\_feature](#) ([l4\\_kernel\\_info\\_t](#) const \*k, char const \*str)

Use [l4\\_kip\\_kernel\\_has\\_feature\(\)](#).

### Global [l4util\\_micros2l4to](#) ([l4\\_uint64\\_t](#) us) [L4\\_NOTHROW](#)

Use [l4\\_timeout\\_from\\_us\(\)](#).

Low-Level Thread Functions . . . . .	646
Random number support . . . . .	646
Timestamp Counter . . . . .	647
vCPU Support Library . . . . .	654
Extended vCPU support . . . . .	662

## Chapter 9

# Namespace Index

### 9.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

<a href="#">cxx</a>	Our C++ library . . . . .	663
<a href="#">cxx::Bits</a>	Internal helpers for the cxx package . . . . .	667
<a href="#">L4</a>	<a href="#">L4</a> low-level kernel interface . . . . .	667
<a href="#">L4::lpc</a>	IPC related functionality . . . . .	677
<a href="#">L4::lpc::Msg</a>	IPC Message related functionality . . . . .	685
<a href="#">L4::lpc_svr</a>	Helper classes for <a href="#">L4::Server</a> instantiation . . . . .	690
<a href="#">L4::Typeid</a>	Definition of interface data-type helpers . . . . .	691
<a href="#">L4::Types</a>	<a href="#">L4</a> basic type helpers for C++ . . . . .	692
<a href="#">L4Re</a>	<a href="#">L4Re</a> C++ Interfaces . . . . .	693
<a href="#">L4Re::Util</a>	Documentation of the <a href="#">L4</a> Runtime Environment utility functionality in C++ . . . . .	709
<a href="#">L4Re::Vfs</a>	Virtual file system for interfaces in POSIX libc . . . . .	718
<a href="#">L4vbus</a>	C++ interface of the <a href="#">Vbus</a> API. . . . .	719
<a href="#">L4virtio</a>	L4-VIRTIO Transport C++ API . . . . .	720

# Chapter 10

## Hierarchical Index

### 10.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

L4::lpc::Array_ref< char const, unsigned long > . . . . .	1033
L4::lpc::Array_ref< ELEM_TYPE, Array_len_default > . . . . .	1033
cxx::Bits::Base_avl_set< ITEM_TYPE, Lt_functor< ITEM_TYPE >, New_allocator, Bits::Avl_set_get_↵ key< ITEM_TYPE > > . . . . .	807
cxx::Bits::Base_avl_set< Pair< KEY_TYPE, DATA_TYPE >, Lt_functor< KEY_TYPE >, New_allocator, Bits::Avl_map_get_key< KEY_TYPE > > . . . . .	807
cxx::Bits::Base_avl_set< Pair< Region, Hdlr >, cxx::Lt_functor< Region >, Alloc, Bits::Avl_map_get_↵ key< Region > > . . . . .	807
cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc > . . . . .	763
cxx::Base_slab< sizeof(Type), L4_PAGESIZE, 2, New_allocator > . . . . .	763
cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator > . . . . .	769
cxx::Bits::Basic_list< Bits::Basic_list_policy< cxx::Base_slab::Slab_i, H_list_item > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< Observer, H_list_item > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item_t< T > > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< T, S_list_item > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< Timeout, H_list_item > > . . . . .	823
cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > > .	823
Block_device::Device_discard_feature . . . . .	721
Block_device::Device_mgr< DEV, FACTORY, SCHEDULER > . . . . .	722
Block_device::Device_with_notification_domain< DEV > . . . . .	723
Block_device::Dma_region_info . . . . .	724
Block_device::Impl::Partitioned_device_discard_mixin< PART_DEV, BASE_DEV, bool > . . . . .	731
Block_device::Partitioned_device< BASE_DEV > . . . . .	738
Block_device::Impl::Partitioned_device_discard_mixin< PART_DEV, BASE_DEV, true > . . . . .	732
Block_device::Inout_block . . . . .	733
Block_device::Inout_memory< DEV > . . . . .	734
Block_device::Mem_region_info . . . . .	735
Block_device::Notification_domain . . . . .	735
Block_device::Partition_info . . . . .	736
Block_device::Partition_reader< DEV > . . . . .	737
Block_device::Pending_request . . . . .	739
Block_device::Scheduler_base< DEV > . . . . .	742
Block_device::Rr_scheduler< DEV > . . . . .	740
L4::Types::Bool< __lface_conflict< I, I2 >::value  _lface_conflict< I, LIST::type >::value > . . . . .	1339

L4::Types::Bool< false > . . . . .	1339
L4::Types::False . . . . .	1340
L4::Types::Same< A, B > . . . . .	1352
L4::Types::Bool< I1::Proto !=PROTO_EMPTY &&I1::Proto==I2::Proto > . . . . .	1339
L4::Types::Bool< lface_conflict< I, L2::type >::value  _Conflict< L1::type, L2::type >::value > . . . . .	1339
L4::Types::Bool< true > . . . . .	1339
L4::Types::True . . . . .	1354
L4::lpc::Msg::ls_valid_rpc_type< A * > . . . . .	1082
L4::lpc::Msg::ls_valid_rpc_type< T > . . . . .	1082
L4::Types::Bool< Typeid::Conflict< L1::type, L2::type >::value  Conflict< L1, LIST... >::value  Conflict< L2, LIST... >::value > . . . . .	1339
L4::Types::Bool< Typeid::lface_conflict< I::type, L::type >::value  lface_conflict< I, LIST... >::value > . . . . .	1339
cxx::Bits::Bst< _Node, Bits::Avl_map_get_key< KEY_TYPE >, Lt_functor< KEY_TYPE > > . . . . .	825
cxx::Bits::Bst< _Node, Bits::Avl_map_get_key< Region >, cxx::Lt_functor< Region > > . . . . .	825
cxx::Bits::Bst< _Node, Bits::Avl_set_get_key< ITEM_TYPE >, Lt_functor< ITEM_TYPE > > . . . . .	825
cxx::Bits::Bst< _Node, GET_KEY, COMPARE > . . . . .	825
cxx::Bits::Bst< Entry, Names_get_key, Lt_functor< typename Get_key::Key_type > > . . . . .	825
cxx::Bits::Bst< Node, Get_key, Lt_functor< typename Get_key::Key_type > > . . . . .	825
L4::lpc::Msg::Cnt_val_ops< Detail::_Plain< T >::type, DIR, CLASS > . . . . .	1067
L4::lpc::Msg::Cnt_val_ops< Detail::_Plain< typename ELEM::arg_type >::type, typename Direction< A * >::type, typename Class< typename Detail::_Plain< A * >::type >::type > . . . . .	1067
L4::lpc::Msg::Cnt_val_ops< Detail::_Plain< typename ELEM::arg_type >::type, typename Direction< A const * >::type, typename Class< typename Detail::_Plain< A const * >::type >::type > . . . . .	1067

L4drivers::Register_block_base< 32 > . . . . .	1428

L4drivers::Register_block_base< 64 > . . . . .	1428
L4drivers::Register_block_base< 8 > . . . . .	1428
L4drivers::Register_block_base< MAX_BITS > . . . . .	1428
L4drivers::Register_block_impl< Mmio_register_block< 32 >, 32 > . . . . .	1429
L4drivers::Register_block_tmpl< Register_block_base< MAX_BITS > > . . . . .	1431
L4drivers::Register_block_tmpl< Register_block_base< MAX_BITS > const > . . . . .	1431
cxx::Bits::Smart_ptr_list< Connection > . . . . .	843
L4::lpc::Msg::Svr_val_ops< Array_ref< A, LEN >, Dir_in, CLASS > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< Array_ref< A, LEN >, Dir_out, CLASS > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< L4::lpc::Snd_fpage, Dir_in, CLASS > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< A * >::type, typename Class< typename Detail::_Plain< A * >::type >::type > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< A >::type, typename Class< typename Detail::_Plain< A >::type >::type > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< A const * >::type, typename Class< typename Detail::_Plain< A const * >::type >::type > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< Array_ref< A, LEN > & >::type, typename Class< typename Detail::_Plain< Array_ref< A, LEN > & >::type >::type > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< Array_ref< A, LEN > >::type, typename Class< typename Detail::_Plain< Array_ref< A, LEN > >::type >::type > . . . . .	1084
L4::lpc::Msg::Svr_val_ops< typename ELEM::svr_type, typename Direction< T >::type, typename Class< typename Detail::_Plain< T >::type >::type > . . . . .	1084
L4Re::Rm::Unique_region< char * > . . . . .	1548
L4Re::Rm::Unique_region< l4_addr_t > . . . . .	1548
L4Re::Rm::Unique_region< l4_uint8_t * > . . . . .	1548
L4Re::Rm::Unique_region< L4virtio::Device::Config_hdr * > . . . . .	1548
L4Re::Rm::Unique_region< l4virtio_config_hdr_t * > . . . . .	1548
L4Re::Rm::Unique_region< unsigned char * > . . . . .	1548
L4Re::Rm::Unique_region< void * > . . . . .	1548
cxx::Bitmap_base::Word< Bits > . . . . .	805
cxx::Bitmap_base::Word< COUNT > . . . . .	805
cxx::Bitmap_base::Word< Size > . . . . .	805

# Chapter 11

## Data Structure Index

### 11.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">Block_device::Device_discard_feature</a>	721
Partial interface for devices that offer discard functionality . . . . .	
<a href="#">Block_device::Device_mgr&lt; DEV, FACTORY, SCHEDULER &gt;</a>	722
Basic class that scans devices and handles client connections . . . . .	
<a href="#">Block_device::Device_with_notification_domain&lt; DEV &gt;</a>	723
Device with a per-device notification domain . . . . .	
<a href="#">Block_device::Dma_region_info</a>	724
Base class used by the driver implementation to derive its own DMA mapping tracking structure	
<a href="#">Block_device::Errand::Errand</a>	724
Wrapper for a small task executed asynchronously in the server loop . . . . .	
<a href="#">Block_device::Errand::Poll_errand</a>	728
Wrapper for a regularly repeated task . . . . .	
<a href="#">Block_device::Impl::Partitioned_device_discard_mixin&lt; PART_DEV, BASE_DEV, bool &gt;</a>	731
Dummy class used when the device class is not derived from <a href="#">Device_discard_feature</a> . . . . .	
<a href="#">Block_device::Impl::Partitioned_device_discard_mixin&lt; PART_DEV, BASE_DEV, true &gt;</a>	732
Mixin implementing discard for partition devices . . . . .	
<a href="#">Block_device::Inout_block</a>	733
Description of an inout block to be sent to the device . . . . .	
<a href="#">Block_device::Inout_memory&lt; DEV &gt;</a>	734
Helper class that temporarily allocates memory that can be used for in/out operations with the device . . . . .	
<a href="#">Block_device::Mem_region_info</a>	735
Additional info stored in each <a href="#">L4virtio::Svr::Driver_mem_region_t</a> used for tracking dataspace-wide DMA mappings . . . . .	
<a href="#">Block_device::Notification_domain</a>	735
Opaque type for representing a notification domain . . . . .	
<a href="#">Block_device::Partition_info</a>	736
Information about a single partition . . . . .	
<a href="#">Block_device::Partition_reader&lt; DEV &gt;</a>	737
Partition table reader for block devices . . . . .	
<a href="#">Block_device::Partitioned_device&lt; BASE_DEV &gt;</a>	738
A partition device for the given device interface . . . . .	
<a href="#">Block_device::Pending_request</a>	739
Interface for pending requests . . . . .	
<a href="#">Block_device::Rr_scheduler&lt; DEV &gt;</a>	740
Round Robin scheduler class . . . . .	

<a href="#">Block_device::Scheduler_base&lt; DEV &gt;</a>	
Scheduler base class	742
<a href="#">cxx::Avl_map&lt; KEY_TYPE, DATA_TYPE, COMPARE, ALLOC &gt;</a>	
AVL tree based associative container	744
<a href="#">cxx::Avl_set&lt; ITEM_TYPE, COMPARE, ALLOC &gt;</a>	
AVL set for simple compareable items	750
<a href="#">cxx::Avl_tree&lt; Node, Get_key, Compare &gt;</a>	
A generic AVL tree	754
<a href="#">cxx::Avl_tree_node</a>	
Node of an AVL tree	761
<a href="#">cxx::Base_slab&lt; Obj_size, Slab_size, Max_free, Alloc &gt;</a>	
Basic slab allocator	763
<a href="#">cxx::Base_slab&lt; Obj_size, Slab_size, Max_free, Alloc &gt;::Slab_i</a>	
Type of a slab	769
<a href="#">cxx::Base_slab_static&lt; Obj_size, Slab_size, Max_free, Alloc &gt;</a>	
Merged slab allocator (allocators for objects of the same size are merged together)	769
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;</a>	
Definition for a member (part) of a bit field	774
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value&lt; TT &gt;</a>	
Internal helper type	786
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value_base&lt; TT &gt;</a>	
Internal helper type	788
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value_unshifted&lt; TT &gt;</a>	
Internal helper type	789
<a href="#">cxx::Bitmap&lt; BITS &gt;</a>	
A static bitmap	790
<a href="#">cxx::Bitmap_base</a>	
Basic bitmap abstraction	795
<a href="#">cxx::Bitmap_base::Bit</a>	
A writeable bit in a bitmap	803
<a href="#">cxx::Bitmap_base::Char&lt; BITS &gt;</a>	
Helper abstraction for a byte contained in the bitmap	804
<a href="#">cxx::Bitmap_base::Word&lt; BITS &gt;</a>	
Helper abstraction for a word contained in the bitmap	805
<a href="#">cxx::Bits::Avl_map_get_key&lt; KEY_TYPE &gt;</a>	
Key-getter for <a href="#">Avl_map</a>	806
<a href="#">cxx::Bits::Avl_set_get_key&lt; KEY_TYPE &gt;</a>	
Internal, key-getter for <a href="#">Avl_set</a> nodes	806
<a href="#">cxx::Bits::Base_avl_set&lt; ITEM_TYPE, COMPARE, ALLOC, GET_KEY &gt;</a>	
Internal: AVL set with internally managed nodes	807
<a href="#">cxx::Bits::Base_avl_set&lt; ITEM_TYPE, COMPARE, ALLOC, GET_KEY &gt;::Node</a>	
A smart pointer to a tree item	820
<a href="#">cxx::Bits::Basic_list&lt; POLICY &gt;</a>	
Internal: Common functions for all head-based list implementations	823
<a href="#">cxx::Bits::Bst&lt; Node, Get_key, Compare &gt;</a>	
Basic binary search tree (BST)	825
<a href="#">cxx::Bits::Bst_node</a>	
Basic type of a node in a binary search tree (BST)	839
<a href="#">cxx::Bits::Direction</a>	
The direction to go in a binary search tree	841
<a href="#">cxx::Bits::Smart_ptr_list&lt; ITEM &gt;</a>	
List of smart-pointer-managed objects	843
<a href="#">cxx::Bits::Smart_ptr_list_item&lt; T, STORE_T &gt;</a>	
List item for an arbitrary item in a <a href="#">Smart_ptr_list</a>	846
<a href="#">cxx::H_list&lt; T, POLICY &gt;</a>	
General double-linked list of unspecified <a href="#">cxx::H_list_item</a> elements	848
<a href="#">cxx::H_list_item_t&lt; ELEM_TYPE &gt;</a>	
Basic element type for a double-linked <a href="#">H_list</a>	856

<a href="#">cxx::H_list_t&lt; T &gt;</a>	Double-linked list of typed <a href="#">H_list_item_t</a> elements . . . . .	859
<a href="#">cxx::List&lt; D, Alloc &gt;</a>	Doubly linked list, with internal allocation . . . . .	862
<a href="#">cxx::List&lt; D, Alloc &gt;::Iter</a>	Iterator . . . . .	864
<a href="#">cxx::List_alloc</a>	Standard list-based allocator . . . . .	865
<a href="#">cxx::List_item</a>	Basic list item . . . . .	868
<a href="#">cxx::List_item::Iter</a>	Iterator for a list of <a href="#">ListItem</a> -s . . . . .	872
<a href="#">cxx::List_item::T_iter&lt; T, Poly &gt;</a>	Iterator for derived classes from <a href="#">ListItem</a> . . . . .	873
<a href="#">cxx::Lt_functor&lt; Obj &gt;</a>	Generic comparator class that defaults to the less-than operator . . . . .	875
<a href="#">cxx::New_allocator&lt; _Type &gt;</a>	Standard allocator based on <code>operator new ()</code> . . . . .	875
<a href="#">cxx::Nothrow</a>	Helper type to distinguish the <code>operator new</code> version that does not throw exceptions . . .	876
<a href="#">cxx::Pair&lt; First, Second &gt;</a>	Pair of two values . . . . .	877
<a href="#">cxx::Pair_first_compare&lt; Cmp, Typ &gt;</a>	Comparison functor for <a href="#">Pair</a> . . . . .	880
<a href="#">cxx::Ref_obj_list_item&lt; T &gt;</a>	Item for list linked via <a href="#">cxx::Ref_ptr</a> with default reference counting . . . . .	882
<a href="#">cxx::Ref_ptr&lt; T, CNT &gt;</a>	A reference-counting pointer with automatic cleanup . . . . .	883
<a href="#">cxx::S_list&lt; T, POLICY &gt;</a>	Simple single-linked list . . . . .	887
<a href="#">cxx::Slab&lt; Type, Slab_size, Max_free, Alloc &gt;</a>	Slab allocator for object of type <code>Type</code> . . . . .	890
<a href="#">cxx::Slab_static&lt; Type, Slab_size, Max_free, Alloc &gt;</a>	Merged slab allocator (allocators for objects of the same size are merged together) . . . . .	894
<a href="#">cxx::static_vector&lt; T, IDX &gt;</a>	Simple encapsulation for a dynamically allocated array . . . . .	898
<a href="#">cxx::String</a>	Allocation free string class with explicit length field . . . . .	899
<a href="#">cxx::Weak_ref&lt; T &gt;</a>	Typed weak reference to an object of type <code>T</code> . . . . .	905
<a href="#">cxx::Weak_ref_base</a>	Generic (base) weak reference to some object . . . . .	908
<a href="#">cxx::Weak_ref_base::List</a>	The list type for keeping all weak references to an object . . . . .	911
<a href="#">Elf32_Auxv</a>	Auxiliary vector (32-bit) . . . . .	915
<a href="#">Elf32_Dyn</a>	ELF32 dynamic entry . . . . .	916
<a href="#">Elf32_Ehdr</a>	ELF32 header . . . . .	917
<a href="#">Elf32_Phdr</a>	ELF32 program header . . . . .	920
<a href="#">Elf32_Rel</a>	ELF32 relocation entry w/o addend . . . . .	921
<a href="#">Elf32_Rela</a>	ELF32 relocation entry w/ addend . . . . .	922
<a href="#">Elf32_Shdr</a>	ELF32 section header . . . . .	923

<a href="#">Elf32_Sym</a>	ELF32 symbol table entry . . . . .	924
<a href="#">Elf64_Auxv</a>	Auxiliary vector (64-bit) . . . . .	925
<a href="#">Elf64_Dyn</a>	ELF64 dynamic entry . . . . .	926
<a href="#">Elf64_Ehdr</a>	ELF64 header . . . . .	927
<a href="#">Elf64_Phdr</a>	ELF64 program header . . . . .	930
<a href="#">Elf64_Rel</a>	ELF64 relocation entry w/o addend . . . . .	931
<a href="#">Elf64_Rela</a>	ELF64 relocation entry w/ addend . . . . .	932
<a href="#">Elf64_Shdr</a>	ELF64 section header . . . . .	933
<a href="#">Elf64_Sym</a>	ELF64 symbol table entry . . . . .	934
<a href="#">gfxbitmap_offset</a>	Offsets in pmap[] and bmap[] . . . . .	935
<a href="#">L4::Alloc_list</a>	A simple list-based allocator . . . . .	936
<a href="#">L4::Arm_smccc</a>	Wrapper for function calls that follow the ARM SMC/HVC calling convention . . . . .	937
<a href="#">L4::Base_exception</a>	Base class for all exceptions, thrown by the <a href="#">L4Re</a> framework . . . . .	938
<a href="#">L4::Basic_registry</a>	This registry returns the corresponding server object based on the label of an <a href="#">lpc_gate</a> . . . . .	941
<a href="#">L4::Bounds_error</a>	Access out of bounds . . . . .	944
<a href="#">L4::Cap&lt; T &gt;</a>	C++ interface for capabilities . . . . .	946
<a href="#">L4::Cap_base</a>	Base class for all kinds of capabilities . . . . .	952
<a href="#">L4::Com_error</a>	Error conditions during IPC . . . . .	963
<a href="#">L4::Debugger</a>	C++ kernel debugger API . . . . .	967
<a href="#">L4::Element_already_exists</a>	<a href="#">Exception</a> for duplicate element insertions . . . . .	976
<a href="#">L4::Element_not_found</a>	<a href="#">Exception</a> for a failed lookup (element not found) . . . . .	979
<a href="#">L4::Epiface</a>	Base class for interface implementations . . . . .	982
<a href="#">L4::Epiface_t&lt; Derived, IFACE, BASE, bool &gt;</a>	<a href="#">Epiface</a> implementation for Kobject-based interface implementations . . . . .	987
<a href="#">L4::Epiface_t0&lt; RPC_IFACE, BASE &gt;</a>	<a href="#">Epiface</a> mixin for generic Kobject-based interfaces . . . . .	990
<a href="#">L4::Exception</a>	<a href="#">Exception</a> interface . . . . .	993
<a href="#">L4::Exception_tracer</a>	Back-trace support for exceptions . . . . .	994
<a href="#">L4::Factory</a>	C++ Factory interface, see <a href="#">Factory</a> for the C interface . . . . .	996
<a href="#">L4::Factory::Lstr</a>	Special type to add a pascal string into the factory create stream . . . . .	1005
<a href="#">L4::Factory::Nil</a>	Special type to add a void argument into the factory create stream . . . . .	1006

<a href="#">L4::Factory::S</a>	Stream class for the <a href="#">create()</a> argument stream . . . . .	1007
<a href="#">L4::lcu</a>	C++ <a href="#">lcu</a> interface, see <a href="#">Interrupt controller</a> for the C interface . . . . .	1011
<a href="#">L4::lcu::Info</a>	This class encapsulates information about an ICU . . . . .	1019
<a href="#">L4::Invalid_capability</a>	Indicates that an invalid object was invoked . . . . .	1021
<a href="#">L4::lo_pager</a>	<a href="#">lo_pager</a> interface . . . . .	1024
<a href="#">L4::lomu</a>	Interface for IO-MMUs used for DMA remapping . . . . .	1026
<a href="#">L4::IOModifier</a>	Modifier class for the IO stream . . . . .	1028
<a href="#">L4::lpc::Array&lt; ELEM_TYPE, LEN_TYPE &gt;</a>	Array data type for dynamically sized arrays in RPCs . . . . .	1029
<a href="#">L4::lpc::Array_in_buf&lt; ELEM_TYPE, LEN_TYPE, MAX &gt;</a>	Server-side copy in buffer for <a href="#">Array</a> . . . . .	1032
<a href="#">L4::lpc::Array_ref&lt; ELEM_TYPE, LEN_TYPE &gt;</a>	Array reference data type for arrays located in the message . . . . .	1033
<a href="#">L4::lpc::As_value&lt; T &gt;</a>	Pass the argument as plain data value . . . . .	1034
<a href="#">L4::lpc::Call</a>	RPC attribute for a standard RPC call . . . . .	1035
<a href="#">L4::lpc::Call_t&lt; RIGHTS &gt;</a>	RPC attribute for an RPC call with required rights . . . . .	1037
<a href="#">L4::lpc::Call_zero_send_timeout</a>	RPC attribute for an RPC call, with zero send timeout . . . . .	1038
<a href="#">L4::lpc::Cap&lt; T &gt;</a>	Capability type for RPC interfaces (see <a href="#">L4::Cap&lt;T&gt;</a> ) . . . . .	1039
<a href="#">L4::lpc::Gen_fpage</a>	Generic RPC base for <a href="#">L4</a> flex-pages . . . . .	1042
<a href="#">L4::lpc::In_out&lt; T &gt;</a>	Mark an argument as in-out argument . . . . .	1045
<a href="#">L4::lpc::lostream</a>	Input/Output stream for IPC [un]marshalling . . . . .	1046
<a href="#">L4::lpc::lstream</a>	Input stream for IPC unmarshalling . . . . .	1056
<a href="#">L4::lpc::Msg::CInt_val_ops&lt; MTYPE, DIR, CLASS &gt;</a>	Defines client-side handling of 'MTYPE' as RPC argument . . . . .	1067
<a href="#">L4::lpc::Msg::Cls_buffer</a>	Marker type for receive buffer values . . . . .	1068
<a href="#">L4::lpc::Msg::Cls_data</a>	Marker type for data values . . . . .	1069
<a href="#">L4::lpc::Msg::Cls_item</a>	Marker type for item values . . . . .	1070
<a href="#">L4::lpc::Msg::Dir_in</a>	Marker type for input values . . . . .	1071
<a href="#">L4::lpc::Msg::Dir_out</a>	Marker type for output values . . . . .	1072
<a href="#">L4::lpc::Msg::Do_in_data</a>	Marker for Input data . . . . .	1073
<a href="#">L4::lpc::Msg::Do_in_items</a>	Marker for Input items . . . . .	1074
<a href="#">L4::lpc::Msg::Do_out_data</a>	Marker for Output data . . . . .	1075
<a href="#">L4::lpc::Msg::Do_out_items</a>	Marker for Output items . . . . .	1076

<a href="#">L4::lpc::Msg::Do_rcv_buffers</a>	
Marker for receive buffers	1077
<a href="#">L4::lpc::Msg::Elem&lt; Array&lt; A, LEN &gt; &amp; &gt;</a>	
Array as output argument	1079
<a href="#">L4::lpc::Msg::Elem&lt; Array&lt; A, LEN &gt; &gt;</a>	
Array as input arguments	1080
<a href="#">L4::lpc::Msg::Elem&lt; Array_ref&lt; A, LEN &gt; &amp; &gt;</a>	
Array_ref as output argument	1081
<a href="#">L4::lpc::Msg::Is_valid_rpc_type&lt; T &gt;</a>	
Type trait defining a valid RPC parameter type	1082
<a href="#">L4::lpc::Msg::Svr_arg_pack&lt; IPC_TYPE &gt;</a>	
Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function	1084
<a href="#">L4::lpc::Msg::Svr_val_ops&lt; MTYPE, DIR, CLASS &gt;</a>	
Defines server-side handling for MTYPE server arguments	1084
<a href="#">L4::lpc::Msg_ptr&lt; T &gt;</a>	
Pointer to an element of type T in an <a href="#">lpc::lstream</a>	1085
<a href="#">L4::lpc::Opt&lt; T &gt;</a>	
Attribute for defining an optional RPC argument	1086
<a href="#">L4::lpc::Ostream</a>	
Output stream for IPC marshalling	1088
<a href="#">L4::lpc::Out&lt; T &gt;</a>	
Mark an argument as a output value in an RPC signature	1094
<a href="#">L4::lpc::Rcv_fpage</a>	
Rcv flex-page	1095
<a href="#">L4::lpc::Ret_array&lt; T &gt;</a>	
Dynamically sized output array of type T	1097
<a href="#">L4::lpc::Send_only</a>	
RPC attribute for a send-only RPC	1098
<a href="#">L4::lpc::Small_buf</a>	
A receive item for receiving a single object capability	1098
<a href="#">L4::lpc::Snd_fpage</a>	
Send flex-page	1100
<a href="#">L4::lpc::Str_cp_in&lt; T &gt;</a>	
Abstraction for extracting a zero-terminated string from an <a href="#">lpc::lstream</a>	1102
<a href="#">L4::lpc::Varg</a>	
Variably sized RPC argument	1103
<a href="#">L4::lpc::Varg_list&lt; MAX &gt;</a>	
Self-contained list of variable-sized RPC parameters	1109
<a href="#">L4::lpc::Varg_list_ref</a>	
List of variable-sized RPC parameters as received by the server	1111
<a href="#">L4::lpc::Varg_list_ref::Iterator</a>	
Iterator for Valists	1113
<a href="#">L4::lpc_gate</a>	
The C++ IPC gate interface, see <a href="#">IPC-Gate API</a> for the C interface	1114
<a href="#">L4::lpc_svr::Br_manager_no_buffers</a>	
Empty implementation of <a href="#">Server_iface</a>	1119
<a href="#">L4::lpc_svr::Compound_reply</a>	
Mix in for LOOP_HOOKS to always use compound reply and wait	1123
<a href="#">L4::lpc_svr::Default_loop_hooks</a>	
Default LOOP_HOOKS	1125
<a href="#">L4::lpc_svr::Default_setup_wait</a>	
Mix in for LOOP_HOOKS for setup_wait no op	1128
<a href="#">L4::lpc_svr::Default_timeout</a>	
Mix in for LOOP_HOOKS to use a 0 send and a infinite receive timeout	1129
<a href="#">L4::lpc_svr::Direct_dispatch&lt; R &gt;</a>	
Direct dispatch helper, for forwarding dispatch calls to a registry <i>R</i>	1131

<a href="#">L4::lpc_svr::Direct_dispatch&lt; R * &gt;</a>	Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry <i>R</i> . . . . .	1133
<a href="#">L4::lpc_svr::Exc_dispatch&lt; R, Exc &gt;</a>	Dispatch helper wrapping try {} catch {} around the dispatch call . . . . .	1134
<a href="#">L4::lpc_svr::Ignore_errors</a>	Mix in for LOOP_HOOKS to ignore IPC errors . . . . .	1136
<a href="#">L4::lpc_svr::Server_iface</a>	Interface for server-loop related functions . . . . .	1137
<a href="#">L4::lpc_svr::Timeout</a>	Callback interface for <a href="#">Timeout_queue</a> . . . . .	1143
<a href="#">L4::lpc_svr::Timeout_queue</a>	<a href="#">Timeout</a> queue to be used in <a href="#">L4re</a> server loop . . . . .	1146
<a href="#">L4::lpc_svr::Timeout_queue_hooks&lt; HOOKS, BR_MAN &gt;</a>	Loop hooks mixin for integrating a timeout queue into the server loop . . . . .	1151
<a href="#">L4::lrq</a>	C++ <a href="#">lrq</a> interface, see <a href="#">IRQs</a> for the C interface . . . . .	1157
<a href="#">L4::lrq_eoi</a>	Interface for sending an unmask message to an object . . . . .	1165
<a href="#">L4::lrq_handler_object</a>	<a href="#">Server</a> object base class for handling <a href="#">IRQ</a> messages . . . . .	1167
<a href="#">L4::lrq_mux</a>	<a href="#">IRQ</a> multiplexer for shared <a href="#">IRQs</a> . . . . .	1170
<a href="#">L4::lrqep_t&lt; Derived, BASE, bool &gt;</a>	<a href="#">Epiface</a> implementation for interrupt handlers . . . . .	1174
<a href="#">L4::Kip::Mem_desc</a>	Memory descriptors stored in the kernel interface page . . . . .	1179
<a href="#">L4::Kobject</a>	Base class for all kinds of kernel objects and remote objects, referenced by capabilities . . . . .	1189
<a href="#">L4::Kobject_2t&lt; Derived, Base1, Base2, PROTO, S_DEMAND &gt;</a>	Helper class to create an <a href="#">L4Re</a> interface class that is derived from two base classes (see <a href="#">L4::Kobject_t</a> ) . . . . .	1192
<a href="#">L4::Kobject_3t&lt; Derived, Base1, Base2, Base3, PROTO, S_DEMAND &gt;</a>	Helper class to create an <a href="#">L4Re</a> interface class that is derived from three base classes (see <a href="#">L4::Kobject_t</a> ) . . . . .	1195
<a href="#">L4::Kobject_demand&lt; T &gt;</a>	Get the combined server-side resource requirements for all type <i>T</i> . . . . .	1199
<a href="#">L4::Kobject_t&lt; Derived, Base, PROTO, S_DEMAND &gt;</a>	Helper class to create an <a href="#">L4Re</a> interface class that is derived from a single base class . . . . .	1200
<a href="#">L4::Kobject_typeid&lt; T &gt;</a>	<a href="#">Meta</a> object for handling access to type information of <a href="#">Kobjects</a> . . . . .	1201
<a href="#">L4::Kobject_typeid&lt; void &gt;</a>	Minimalistic ID for <code>void</code> interface . . . . .	1204
<a href="#">L4::Kobject_x&lt; Derived, ARGS &gt;</a>	Generic <a href="#">Kobject</a> inheritance template . . . . .	1205
<a href="#">L4::Meta</a>	<a href="#">Meta</a> interface that shall be implemented by each <a href="#">L4Re</a> object and gives access to the dynamic type information for <a href="#">L4Re</a> objects . . . . .	1206
<a href="#">L4::Out_of_memory</a>	<a href="#">Exception</a> signalling insufficient memory . . . . .	1211
<a href="#">L4::Pager</a>	<a href="#">Pager</a> interface including the <a href="#">lo_pager</a> interface . . . . .	1214
<a href="#">L4::Platform_control</a>	<a href="#">L4</a> C++ interface for controlling platform-wide properties, see <a href="#">Platform Control C API</a> for the C interface . . . . .	1218
<a href="#">L4::Poll_timeout_counter</a>	Evaluate an expression for a maximum number of times . . . . .	1222
<a href="#">L4::Poll_timeout_kipclock</a>	A polling timeout based on the <a href="#">L4Re</a> clock . . . . .	1225

<a href="#">L4::Proto_t&lt; P &gt;</a>	Data type for defining protocol numbers . . . . .	1228
<a href="#">L4::Rcv_endpoint</a>	Interface for kernel objects that allow to receive IPC from them . . . . .	1229
<a href="#">L4::Registry_iface</a>	Abstract interface for object registries . . . . .	1233
<a href="#">L4::Runtime_error</a>	<a href="#">Exception</a> for an abstract runtime error . . . . .	1237
<a href="#">L4::Scheduler</a>	C++ interface of the <a href="#">Scheduler</a> kernel object, see <a href="#">Scheduler</a> for the C interface . . . . .	1241
<a href="#">L4::Semaphore</a>	C++ Kernel-provided semaphore interface, see <a href="#">Kernel-provided semaphore</a> for the C interface . . . . .	1248
<a href="#">L4::Server&lt; LOOP_HOOKS &gt;</a>	Basic server loop for handling client requests . . . . .	1254
<a href="#">L4::Server_object</a>	Abstract server object to be used with <a href="#">L4::Server</a> and <a href="#">L4::Basic_registry</a> . . . . .	1259
<a href="#">L4::Server_object_t&lt; IFACE, BASE &gt;</a>	Base class (template) for server implementing server objects . . . . .	1263
<a href="#">L4::Server_object_x&lt; Derived, IFACE, BASE &gt;</a>	Helper class to implement p_dispatch based server objects . . . . .	1269
<a href="#">L4::Smart_cap&lt; T, SMART &gt;</a>	Smart capability class . . . . .	1272
<a href="#">L4::String</a>	A null-terminated string container class . . . . .	1276
<a href="#">L4::Task</a>	C++ interface of the <a href="#">Task</a> kernel object, see <a href="#">Task</a> for the C interface . . . . .	1277
<a href="#">L4::Thread</a>	C++ <a href="#">L4</a> kernel thread interface, see <a href="#">Thread</a> for the C interface . . . . .	1289
<a href="#">L4::Thread::Attr</a>	<a href="#">Thread</a> attributes used for <a href="#">control()</a> . . . . .	1302
<a href="#">L4::Thread::Modify_senders</a>	Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread . . . . .	1307
<a href="#">L4::Triggerable</a>	Interface that allows an object to be triggered by some source . . . . .	1309
<a href="#">L4::Type_info</a>	Dynamic Type Information for <a href="#">L4Re</a> Interfaces . . . . .	1313
<a href="#">L4::Type_info::Demand</a>	Data type for expressing the needed receive buffers at the server-side of an interface . . . . .	1314
<a href="#">L4::Type_info::Demand_t&lt; CAPS, FLAGS, MEM, PORTS &gt;</a>	Template type statically describing demand of receive buffers . . . . .	1318
<a href="#">L4::Type_info::Demand_union_t&lt; D1, D2 &gt;</a>	Template type statically describing the combination of two <a href="#">Demand</a> object . . . . .	1320
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, X &gt;</a>	Empty list of RPCs . . . . .	1323
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, Default_op&lt; R &gt; &gt;::Rpc&lt; Y &gt;</a>	Find the given RPC in the list . . . . .	1325
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, R, X... &gt;</a>	Non-empty list of RPCs . . . . .	1325
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, R, X... &gt;::Rpc&lt; Y &gt;</a>	Find the given RPC in the list . . . . .	1327
<a href="#">L4::Typeid::Detail::Rpc_end</a>	Internal end-of-list marker . . . . .	1327
<a href="#">L4::Typeid::P_dispatch&lt; LIST &gt;</a>	Use for protocol based dispatch stage . . . . .	1328
<a href="#">L4::Typeid::Raw_ipc&lt; CLASS &gt;</a>	RPCs list for passing raw incoming IPC to the server object . . . . .	1329

<a href="#">L4::Typeid::Rpc_nocode&lt; OPERATION &gt;</a>	1330
List of RPCs of an interface using a single operation without an opcode	
<a href="#">L4::Typeid::Rpcs&lt; RPCS &gt;</a>	1332
Standard list of RPCs of an interface	
<a href="#">L4::Typeid::Rpcs_code&lt; OPCODE_TYPE &gt;</a>	1334
List of RPCs of an interface using a special opcode type	
<a href="#">L4::Typeid::Rpcs_code&lt; OPCODE_TYPE &gt;::F&lt; RPCS &gt;</a>	1335
<a href="#">L4::Typeid::Rpcs_sys&lt; ARG &gt;</a>	1337
List of RPCs typically used for kernel interfaces	
<a href="#">L4::Types::Bool&lt; V &gt;</a>	1339
Boolean meta type	
<a href="#">L4::Types::False</a>	1340
False meta value	
<a href="#">L4::Types::Flags&lt; BITS_ENUM, UNDERLYING &gt;</a>	1342
Template for defining typical <a href="#">Flags</a> bitmaps	
<a href="#">L4::Types::Flags_ops_t&lt; DT &gt;</a>	1346
Mixin class to define a set of friend bitwise operators on DT	
<a href="#">L4::Types::Flags_t&lt; DT, T &gt;</a>	1348
Template type to define a flags type with bitwise operations	
<a href="#">L4::Types::Int_for_size&lt; SIZE, bool &gt;</a>	1350
Metafunction to get an unsigned integral type for the given size	
<a href="#">L4::Types::Int_for_type&lt; T &gt;</a>	1351
Metafunction to get an integral type of the same size as T	
<a href="#">L4::Types::Same&lt; A, B &gt;</a>	1352
Compare two data types for equality	
<a href="#">L4::Types::True</a>	1354
True meta value	
<a href="#">L4::Uart</a>	1356
Uart driver abstraction	
<a href="#">L4::Uart_apb</a>	1361
Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (apb)	
<a href="#">L4::Unknown_error</a>	1367
Exception for an unknown condition	
<a href="#">L4::Vcon</a>	1369
C++ <a href="#">L4 Vcon</a> interface, see <a href="#">Virtual Console</a> for the C interface	
<a href="#">L4::Vm</a>	1378
Virtual machine host address space	
<a href="#">l4_buf_regs_t</a>	1383
Encapsulation of the buffer-registers block in the UTCB	
<a href="#">l4_exc_regs_t</a>	1384
UTCB structure for exceptions	
<a href="#">l4_ext_vcpu_state_vmx_t</a>	1387
VMX extended vCPU state	
<a href="#">l4_fpage_t</a>	1388
L4 flexpage type	
<a href="#">l4_icu_info_t</a>	1389
Info structure for an ICU	
<a href="#">l4_icu_msi_info_t</a>	1390
Info to use for a specific MSI	
<a href="#">l4_kernel_info_mem_desc_t</a>	1391
Memory descriptor data structure	
<a href="#">l4_kernel_info_t</a>	1392
L4 Kernel Interface Page	
<a href="#">l4_msg_regs_t</a>	1394
Encapsulation of the message-register block in the UTCB	
<a href="#">l4_msgtag_t</a>	1395
Message tag data structure	

<a href="#">l4_sched_cpu_set_t</a>	
CPU sets	1397
<a href="#">l4_sched_param_t</a>	
Scheduler parameter set	1401
<a href="#">l4_snd_fpage_t</a>	
Send-flex-page types	1402
<a href="#">l4_thread_regs_t</a>	
Encapsulation of the thread-control-register block of the UTCB	1403
<a href="#">l4_timeout_s</a>	
Basic timeout specification	1404
<a href="#">l4_timeout_t</a>	
Timeout pair	1405
<a href="#">l4_vcon_attr_t</a>	
Vcon attribute structure	1406
<a href="#">l4_vcpu_arch_state_t</a>	
Architecture-specific vCPU state	1407
<a href="#">l4_vcpu_ipc_regs_t</a>	
VCPU message registers	1408
<a href="#">l4_vcpu_regs_t</a>	
VCPU registers	1409
<a href="#">l4_vcpu_state_t</a>	
State of a vCPU	1413
<a href="#">l4_vhw_descriptor</a>	
Virtual hardware devices description	1416
<a href="#">l4_vhw_entry</a>	
Description of a device	1417
<a href="#">l4_vm_svm_vmcb_control_area</a>	
VMCB structure for SVM VMs	1418
<a href="#">l4_vm_svm_vmcb_state_save_area</a>	
State save area structure for SVM VMs	1419
<a href="#">l4_vm_svm_vmcb_state_save_area_seg</a>	
State save area segment selector struct	1420
<a href="#">l4_vm_svm_vmcb_t</a>	
Control structure for SVM VMs	1420
<a href="#">l4_vm_tz_state</a>	
State structure for TrustZone VMs	1421
<a href="#">l4_vmx_offset_table_t</a>	
Software VMCS field offset table	1422
<a href="#">L4drivers::Mmio_register_block&lt; MAX_BITS &gt;</a>	
An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order	1424
<a href="#">L4drivers::Register_block&lt; MAX_BITS, BLOCK &gt;</a>	
Handles a reference to a register block of the given maximum access width	1425
<a href="#">L4drivers::Register_block_base&lt; MAX_BITS &gt;</a>	
Abstract register block interface	1428
<a href="#">L4drivers::Register_block_impl&lt; BASE, MAX_BITS &gt;</a>	
Implementation helper for register blocks	1429
<a href="#">L4drivers::Register_block_tmpl&lt; BLOCK &gt;</a>	
Helper template that translates to the <a href="#">Register_block_base</a> interface	1431
<a href="#">L4drivers::Register_tmpl&lt; BITS, BLOCK &gt;</a>	
Single hardware register inside a <a href="#">Register_block_base</a> interface	1432
<a href="#">L4drivers::Ro_register_block&lt; MAX_BITS, BLOCK &gt;</a>	
Handles a reference to a read only register block of the given maximum access width	1436
<a href="#">L4drivers::Ro_register_tmpl&lt; BITS, BLOCK &gt;</a>	
Single read only register inside a <a href="#">Register_block_base</a> interface	1438
<a href="#">L4Re::Cap_alloc</a>	
Capability allocator interface	1440
<a href="#">L4Re::Console</a>	
Console class	1443

<a href="#">L4Re::Dataspace</a>	
Interface for memory-like objects	1446
<a href="#">L4Re::Dataspace::F</a>	
<a href="#">Dataspace</a> flags definitions	1457
<a href="#">L4Re::Dataspace::Stats</a>	
Information about the dataspace	1458
<a href="#">L4Re::Debug_obj</a>	
Debug interface	1459
<a href="#">L4Re::Default_event_payload</a>	
Default event stream payload	1462
<a href="#">L4Re::Dma_space</a>	
Managed DMA Address Space	1463
<a href="#">L4Re::Env</a>	
C++ interface of the initial environment that is provided to an <a href="#">L4</a> task	1469
<a href="#">L4Re::Event</a>	
Event class	1481
<a href="#">L4Re::Event_buffer_t&lt; PAYLOAD &gt;</a>	
Event buffer class	1488
<a href="#">L4Re::Event_buffer_t&lt; PAYLOAD &gt;::Event</a>	
Event structure used in buffer	1492
<a href="#">L4Re::Inhibitor</a>	
Set of inhibitor locks, which inhibit specific actions when held	1493
<a href="#">L4Re::Log</a>	
Log interface class	1498
<a href="#">L4Re::Mem_alloc</a>	
Memory allocation interface	1503
<a href="#">L4Re::Mmio_space</a>	
Interface for memory-like address space accessible via IPC	1509
<a href="#">L4Re::Namespace</a>	
Name-space interface	1513
<a href="#">L4Re::Ned::Cmd_control</a>	
Direct control interface for Ned	1520
<a href="#">L4Re::Parent</a>	
Parent interface	1522
<a href="#">L4Re::Random</a>	
Low-bandwidth interface for random number generators	1526
<a href="#">L4Re::Rm</a>	
Region map	1531
<a href="#">L4Re::Rm::F</a>	
Rm flags definitions	1545
<a href="#">L4Re::Rm::Range</a>	
A range of virtual addresses	1547
<a href="#">L4Re::Rm::Unique_region&lt; T &gt;</a>	
Unique region	1548
<a href="#">L4Re::Smart_cap_auto&lt; Unmap_flags &gt;</a>	
Helper for Unique_cap and Unique_del_cap	1554
<a href="#">L4Re::Smart_count_cap&lt; Unmap_flags &gt;</a>	
Helper for Ref_cap and Ref_del_cap	1555
<a href="#">L4Re::Util::Br_manager</a>	
Buffer-register (BR) manager for <a href="#">L4::Server</a>	1556
<a href="#">L4Re::Util::Br_manager_hooks</a>	
Predefined server-loop hooks for a server loop using the <a href="#">Br_manager</a>	1562
<a href="#">L4Re::Util::Br_manager_timeout_hooks</a>	
Predefined server-loop hooks for a server with using the <a href="#">Br_manager</a> and a timeout queue	1564
<a href="#">L4Re::Util::Cap_alloc_base</a>	
Capability allocator	1568
<a href="#">L4Re::Util::Counter&lt; COUNTER &gt;</a>	
Counter for <a href="#">Counting_cap_alloc</a> with variable data width	1569

<a href="#">L4Re::Util::Counter_atomic&lt; COUNTER &gt;</a>	
Thread safe version of counter for <a href="#">Counting_cap_alloc</a>	1571
<a href="#">L4Re::Util::Counting_cap_alloc&lt; COUNTERTYPE, Dbg &gt;</a>	
Internal reference-counting cap allocator	1572
<a href="#">L4Re::Util::Dataspace_svr</a>	
Dataspace server class	1578
<a href="#">L4Re::Util::Event_buffer_consumer_t&lt; PAYLOAD &gt;</a>	
An event buffer consumer	1584
<a href="#">L4Re::Util::Event_buffer_t&lt; PAYLOAD &gt;</a>	
Event_buffer utility class	1589
<a href="#">L4Re::Util::Event_svr&lt; SVR &gt;</a>	
Convenience wrapper for implementing an event server	1593
<a href="#">L4Re::Util::Event_t&lt; PAYLOAD &gt;</a>	
Convenience wrapper for getting access to an event object	1595
<a href="#">L4Re::Util::Item_alloc_base</a>	
Item allocator	1599
<a href="#">L4Re::Util::Names::Name</a>	
Name class	1599
<a href="#">L4Re::Util::Names::Name_space</a>	
Abstract server-side implementation of the <a href="#">L4::Namespace</a> interface	1603
<a href="#">L4Re::Util::Object_registry</a>	
A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread	1607
<a href="#">L4Re::Util::Ref_cap&lt; T &gt;</a>	
Automatic capability that implements automatic free and unmap of the capability selector	1614
<a href="#">L4Re::Util::Ref_del_cap&lt; T &gt;</a>	
Automatic capability that implements automatic free and unmap+delete of the capability selector	1615
<a href="#">L4Re::Util::Registry_server&lt; LOOP_HOOKS &gt;</a>	
A server loop object which has a <a href="#">Object_registry</a> included	1616
<a href="#">L4Re::Util::Smart_cap_auto&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Unique_cap</a> and <a href="#">Unique_del_cap</a>	1621
<a href="#">L4Re::Util::Smart_count_cap&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Ref_cap</a> and <a href="#">Ref_del_cap</a>	1622
<a href="#">L4Re::Util::Vcon_svr&lt; SVR &gt;</a>	
Console server template class	1623
<a href="#">L4Re::Util::Video::Goos_svr</a>	
Goos server class	1624
<a href="#">L4Re::Vfs::Be_file</a>	
Boiler plate class for implementing an open file for <a href="#">L4Re::Vfs</a>	1627
<a href="#">L4Re::Vfs::Be_file_system</a>	
Boilerplate class for implementing a <a href="#">L4Re::Vfs::File_system</a>	1631
<a href="#">L4Re::Vfs::Directory</a>	
Interface for a POSIX file that is a directory	1634
<a href="#">L4Re::Vfs::File</a>	
The basic interface for an open POSIX file	1639
<a href="#">L4Re::Vfs::File_system</a>	
Basic interface for an <a href="#">L4Re::Vfs</a> file system	1642
<a href="#">L4Re::Vfs::Fs</a>	
POSIX File-system related functionality	1644
<a href="#">L4Re::Vfs::Generic_file</a>	
The common interface for an open POSIX file	1648
<a href="#">L4Re::Vfs::Mman</a>	
Interface for POSIX memory management	1651
<a href="#">L4Re::Vfs::Ops</a>	
Interface for the POSIX backends of an application	1653
<a href="#">L4Re::Vfs::Regular_file</a>	
Interface for a POSIX file that provides regular file semantics	1656

<a href="#">L4Re::Vfs::Special_file</a>	
Interface for a POSIX file that provides special file semantics . . . . .	1662
<a href="#">L4Re::Video::Color_component</a>	
A color component . . . . .	1664
<a href="#">L4Re::Video::Goos</a>	
Class that abstracts framebuffers . . . . .	1668
<a href="#">L4Re::Video::Goos::Info</a>	
Information structure of a <a href="#">Goos</a> . . . . .	1674
<a href="#">L4Re::Video::Pixel_info</a>	
Pixel information . . . . .	1676
<a href="#">L4Re::Video::View</a>	
<a href="#">View</a> of a framebuffer . . . . .	1684
<a href="#">L4Re::Video::View::Info</a>	
Information structure of a view . . . . .	1688
<a href="#">l4re_aux_t</a>	
Auxiliary descriptor . . . . .	1691
<a href="#">l4re_ds_stats_t</a>	
Information about the data space . . . . .	1692
<a href="#">l4re_elf_aux_mword_t</a>	
Auxiliary vector element for a single unsigned data word . . . . .	1692
<a href="#">l4re_elf_aux_t</a>	
Generic header for each auxiliary vector element . . . . .	1693
<a href="#">l4re_elf_aux_vma_t</a>	
Auxiliary vector element for a reserved virtual memory area . . . . .	1693
<a href="#">l4re_env_cap_entry_t</a>	
Entry in the <a href="#">L4Re</a> environment array for the named initial objects . . . . .	1694
<a href="#">l4re_env_t</a>	
Initial environment data structure . . . . .	1696
<a href="#">l4re_event_t</a>	
Event structure used in buffer . . . . .	1698
<a href="#">l4re_video_color_component_t</a>	
Color component structure . . . . .	1699
<a href="#">l4re_video_goos_info_t</a>	
Goos information structure . . . . .	1699
<a href="#">l4re_video_pixel_info_t</a>	
Pixel_info structure . . . . .	1701
<a href="#">l4re_video_view_info_t</a>	
View information structure . . . . .	1702
<a href="#">l4re_video_view_t</a>	
C representation of a goos view . . . . .	1703
<a href="#">l4shmc_ringbuf_head_t</a>	
Head field of a ring buffer . . . . .	1704
<a href="#">l4shmc_ringbuf_t</a>	
Ring buffer . . . . .	1705
<a href="#">l4util_idt_desc_t</a>	
IDT entry . . . . .	1706
<a href="#">l4util_idt_header_t</a>	
Header of an IDT table . . . . .	1707
<a href="#">l4util_l4mod_info</a>	
Base module structure . . . . .	1708
<a href="#">l4util_l4mod_mod</a>	
A single module . . . . .	1709
<a href="#">l4util_mb_addr_range_t</a>	
INT-15, AX=E820 style "AddressRangeDescriptor" ...with a "size" parameter on the front which is the structure size - 4, pointing to the next one, up until the full buffer length of the memory map has been reached . . . . .	1710
<a href="#">l4util_mb_apm_t</a>	
APM BIOS info . . . . .	1711

<a href="#">L4util_mb_drive_t</a>	
Drive Info structure	1712
<a href="#">L4util_mb_info_t</a>	
MultiBoot Info description	1714
<a href="#">L4util_mb_mod_t</a>	
The structure type "mod_list" is used by the <a href="#">multiboot_info</a> structure	1715
<a href="#">L4util_mb_vbe_ctrl_t</a>	
VBE controller information	1716
<a href="#">L4util_mb_vbe_mode_t</a>	
VBE mode information	1717
<a href="#">L4vbus::Device</a>	
Device on a <a href="#">L4vbus::Vbus</a>	1721
<a href="#">L4vbus::Gpio_module</a>	
A <a href="#">Gpio_module</a> groups multiple GPIO pins together	1730
<a href="#">L4vbus::Gpio_module::Pin_slice</a>	
A slice of the pins provided by this module	1737
<a href="#">L4vbus::Gpio_pin</a>	
A GPIO pin	1737
<a href="#">L4vbus::Icu</a>	
Vbus Interrupt controller API	1746
<a href="#">L4vbus::Pci_dev</a>	
A PCI device	1750
<a href="#">L4vbus::Pci_host_bridge</a>	
A Pci host bridge	1756
<a href="#">L4vbus::Pm&lt; DEC &gt;</a>	
Power-management API mixin	1762
<a href="#">L4vbus::Vbus</a>	
The virtual bus ( <a href="#">Vbus</a> ) interface	1765
<a href="#">L4vbus_device_t</a>	
Detailed information about a vbus device	1776
<a href="#">L4vbus_resource_t</a>	
Description of a single vbus resource	1777
<a href="#">L4vcpu::State</a>	
C++ implementation of state word in the vCPU area	1778
<a href="#">L4vcpu::Vcpu</a>	
C++ implementation of the vCPU save state area	1780
<a href="#">L4virtio::Device</a>	
IPC interface for virtio over <a href="#">L4 IPC</a>	1791
<a href="#">L4virtio::Driver::Block_device</a>	
Simple class for accessing a virtio block device synchronously	1799
<a href="#">L4virtio::Driver::Block_device::Handle</a>	
Handle to an ongoing request	1808
<a href="#">L4virtio::Driver::Device</a>	
Client-side implementation for a general virtio device	1809
<a href="#">L4virtio::Driver::Virtio_net_device</a>	
Simple class for accessing a virtio net device	1822
<a href="#">L4virtio::Driver::Virtio_net_device::Packet</a>	
Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated	1831
<a href="#">L4virtio::Driver::Virtqueue</a>	
Driver-side implementation of a <a href="#">Virtqueue</a>	1831
<a href="#">L4virtio::Ptr&lt; T &gt;</a>	
Pointer used in virtio descriptors	1842
<a href="#">L4virtio::Svr::Bad_descriptor</a>	
Exception used by Queue to indicate descriptor errors	1846
<a href="#">L4virtio::Svr::Block_dev_base&lt; Ds_data &gt;</a>	
Base class for virtio block devices	1848

<a href="#">L4virtio::Svr::Block_request&lt; Ds_data &gt;</a>	
A request to read or write data . . . . .	1856
<a href="#">L4virtio::Svr::Console::Control_message</a>	
Virtio console control message . . . . .	1859
<a href="#">L4virtio::Svr::Console::Control_request</a>	
Specialised <code>Virtqueue::Request</code> providing access to control message payload . . . . .	1860
<a href="#">L4virtio::Svr::Console::Device</a>	
Base class implementing a virtio console device with L4Re-based notification handling . . . . .	1862
<a href="#">L4virtio::Svr::Console::Device_port</a>	
A console port with associated read/write state . . . . .	1874
<a href="#">L4virtio::Svr::Console::Features</a>	
Virtio console specific feature bits . . . . .	1878
<a href="#">L4virtio::Svr::Console::Port</a>	
Representation of a Virtio console port . . . . .	1881
<a href="#">L4virtio::Svr::Console::Virtio_con</a>	
Base class implementing a virtio console functionality . . . . .	1884
<a href="#">L4virtio::Svr::Data_buffer</a>	
Abstract data buffer . . . . .	1899
<a href="#">L4virtio::Svr::Dev_config</a>	
Abstraction for L4-Virtio device config memory . . . . .	1903
<a href="#">L4virtio::Svr::Dev_features</a>	
Type for device feature bitmap . . . . .	1916
<a href="#">L4virtio::Svr::Dev_status</a>	
Type of the device status register . . . . .	1918
<a href="#">L4virtio::Svr::Device_t&lt; DATA &gt;</a>	
Server-side L4-VIRTIO device stub . . . . .	1919
<a href="#">L4virtio::Svr::Driver_mem_list_t&lt; DATA &gt;</a>	
List of driver memory regions assigned to a single L4-VIRTIO transport instance . . . . .	1927
<a href="#">L4virtio::Svr::Driver_mem_region_t&lt; DATA &gt;</a>	
Region of driver memory, that shall be managed locally . . . . .	1936
<a href="#">L4virtio::Svr::Request_processor</a>	
Encapsulate the state for processing a VIRTIO request . . . . .	1943
<a href="#">L4virtio::Svr::Scmi::Base_attr_t</a>	
SCMI base protocol attributes . . . . .	1950
<a href="#">L4virtio::Svr::Scmi::Base_proto</a>	
Base class for the SCMI base protocol . . . . .	1951
<a href="#">L4virtio::Svr::Scmi::Perf_proto</a>	
Base class for the SCMI performance protocol . . . . .	1953
<a href="#">L4virtio::Svr::Scmi::Performance_attr_t</a>	
SCMI performance protocol attributes . . . . .	1956
<a href="#">L4virtio::Svr::Scmi::Performance_describe_level_t</a>	
SCMI performance describe level . . . . .	1956
<a href="#">L4virtio::Svr::Scmi::Performance_describe_levels_n_t</a>	
SCMI performance describe levels numbers . . . . .	1957
<a href="#">L4virtio::Svr::Scmi::Performance_domain_attr_t</a>	
SCMI performance domain protocol attributes . . . . .	1958
<a href="#">L4virtio::Svr::Scmi::Proto&lt; OBSERV &gt;</a>	
Base class for all protocols . . . . .	1959
<a href="#">L4virtio::Svr::Scmi::Scmi_dev</a>	
A server implementation of the virtio-scmi protocol . . . . .	1960
<a href="#">L4virtio::Svr::Scmi::Scmi_hdr_t</a>	
SCMI header . . . . .	1964
<a href="#">L4virtio::Svr::Virtqueue</a>	
<code>Virtqueue</code> implementation for the device . . . . .	1964
<a href="#">L4virtio::Svr::Virtqueue::Head_desc</a>	
VIRTIO request, essentially a descriptor from the available ring . . . . .	1975
<a href="#">L4virtio::Virtqueue</a>	
Low-level <code>Virtqueue</code> . . . . .	1977

<a href="#">L4virtio::Virtqueue::Avail</a>	Type of available ring, this is read-only for the host . . . . .	1995
<a href="#">L4virtio::Virtqueue::Avail::Flags</a>	Flags of the available ring . . . . .	1996
<a href="#">L4virtio::Virtqueue::Desc</a>	Descriptor in the descriptor table . . . . .	1997
<a href="#">L4virtio::Virtqueue::Desc::Flags</a>	Type for descriptor flags . . . . .	1999
<a href="#">L4virtio::Virtqueue::Used</a>	Used ring . . . . .	2001
<a href="#">L4virtio::Virtqueue::Used::Flags</a>	Flags for the used ring . . . . .	2002
<a href="#">L4virtio::Virtqueue::Used_elem</a>	Type of an element of the used ring . . . . .	2003
<a href="#">l4virtio_block_config_t</a>	Device configuration for block devices . . . . .	2004
<a href="#">l4virtio_block_discard_t</a>	Structure used for the write zeroes and discard commands . . . . .	2005
<a href="#">l4virtio_block_header_t</a>	Header structure of a request for a block device . . . . .	2006
<a href="#">l4virtio_config_hdr_t</a>	L4-VIRTIO config header, provided in shared data space . . . . .	2007
<a href="#">l4virtio_config_queue_t</a>	Queue configuration entry . . . . .	2008
<a href="#">l4virtio_input_absinfo_t</a>	Information about the absolute axis in the underlying evdev implementation . . . . .	2009
<a href="#">l4virtio_input_config_t</a>	Device configuration for input devices . . . . .	2010
<a href="#">l4virtio_input_devids_t</a>	Device ID information for the device . . . . .	2010
<a href="#">l4virtio_input_event_t</a>	Single event in event or status queue . . . . .	2011
<a href="#">l4virtio_net_config_t</a>	Device configuration for network devices . . . . .	2011
<a href="#">l4virtio_net_header_t</a>	Header structure of a request for a network device . . . . .	2012

# Chapter 12

## File Index

### 12.1 File List

Here is a list of all documented files with brief descriptions:

pkg/drivers-frst/include/asm_access_gen.h	2018
pkg/drivers-frst/include/hw_mmio_register_block	2018
pkg/drivers-frst/include/hw_register_block	2019
pkg/drivers-frst/include/io_regblock.h	2025
pkg/drivers-frst/include/io_regblock_port.h	2027
pkg/drivers-frst/include/Makefile	2028
pkg/drivers-frst/include/poll_timeout_counter.h	2028
pkg/drivers-frst/include/ARCH-amd64/asm_access.h	2013
pkg/drivers-frst/include/ARCH-arm/asm_access.h	2013
pkg/drivers-frst/include/ARCH-arm64/asm_access.h	2014
pkg/drivers-frst/include/ARCH-mips/asm_access.h	2015
pkg/drivers-frst/include/ARCH-ppc32/asm_access.h	2015
pkg/drivers-frst/include/ARCH-riscv/asm_access.h	2016
pkg/drivers-frst/include/ARCH-sparc/asm_access.h	2017
pkg/drivers-frst/include/ARCH-x86/asm_access.h	2017
pkg/drivers-frst/uart/include/Makefile	2028
pkg/drivers-frst/uart/include/uart_16550.h	2029
pkg/drivers-frst/uart/include/uart_16550_dw.h	2030
pkg/drivers-frst/uart/include/uart_apb.h	2030
pkg/drivers-frst/uart/include/uart_base.h	2031
pkg/drivers-frst/uart/include/uart_cadence.h	2032
pkg/drivers-frst/uart/include/uart_dcc-v6.h	2032
pkg/drivers-frst/uart/include/uart_dm.h	2033
pkg/drivers-frst/uart/include/uart_dummy.h	2033
pkg/drivers-frst/uart/include/uart_geni.h	2034
pkg/drivers-frst/uart/include/uart_imx.h	2034
pkg/drivers-frst/uart/include/uart_leon3.h	2035
pkg/drivers-frst/uart/include/uart_linflex.h	2036
pkg/drivers-frst/uart/include/uart_lpuart.h	2036
pkg/drivers-frst/uart/include/uart_mvebu.h	2037
pkg/drivers-frst/uart/include/uart_of.h	2037
pkg/drivers-frst/uart/include/uart_omap35x.h	2038
pkg/drivers-frst/uart/include/uart_pl011.h	2038
pkg/drivers-frst/uart/include/uart_s3c2410.h	2039
pkg/drivers-frst/uart/include/uart_sa1000.h	2040

pkg/drivers-frst/uart/include/uart_sbi.h	2041
pkg/drivers-frst/uart/include/uart_sh.h	2041
pkg/l4re-core/ned/lib/include/cmd_control	2041
pkg/l4re-core/ned/lib/include/Makefile	2028
amd64/l4/sys/__kip-arch.h	2091
amd64/l4/sys/__vcpu-arch.h	
AMD64-specific vCPU interface	2092
amd64/l4/sys/cache.h	
Cache functions	2697
amd64/l4/sys/consts.h	
Common L4 constants, amd64 version	2480
amd64/l4/sys/ktrace_events.h	2101
amd64/l4/sys/l4int.h	
Fixed sized integer types, amd64 version	2857
amd64/l4/sys/linkage.h	
Linkage	2111
amd64/l4/sys/segment.h	
Segment handling	2069
amd64/l4/sys/utcb.h	
UTCB definitions for amd64	2919
amd64/l4/sys/vm.h	2116
amd64/l4/util/bitops_arch.h	
Amd64 bit manipulation functions	2118
amd64/l4/util/cpu.h	
CPU related functions	2125
amd64/l4/util/idt.h	
IDT related functions	2042
amd64/l4/util/irq.h	
Some PIC and hardware interrupt related functions	2814
amd64/l4/util/l4_macros.h	
Main function	2130
amd64/l4/util/mbi_argv.h	
Command line handling	2133
amd64/l4/util/perform.h	
Performance Monitoring using P5/P6 Measurement Counters	2046
amd64/l4/util/port_io.h	
Port I/O functions	2083
amd64/l4/util/rdtsc.h	
Timestamp counter related functions	2058
amd64/l4/util/spin.h	
Spinning for amd64	2067
amd64/l4f/l4/sys/ipc.h	2795
amd64/l4f/l4/sys/segment.h	
L4f specific fs/gs manipulation	2075
amd64/l4f/l4/util/port_io.h	
Port I/O functions	2084
arm/l4/sys/__kip-arch.h	2092
arm/l4/sys/__vcpu-arch.h	
ARM-specific vCPU interface	2095
arm/l4/sys/atomic.h	
Atomic memory modifications	2150
arm/l4/sys/cache.h	
Cache functions	2698
arm/l4/sys/consts.h	
Common L4 constants, arm version	2481
arm/l4/sys/ktrace_events.h	2104
arm/l4/sys/l4int.h	
Fixed sized integer types, arm version	2858

arm/l4/sys/linkage.h	
Linkage	2112
arm/l4/sys/mem_op.h	
Memory access functions (ARM specific)	2113
arm/l4/sys/platform_control.h	2869
arm/l4/sys/task.h	2899
arm/l4/sys/thread.h	
ARM-specific thread related definitions	2903
arm/l4/sys/utcb.h	
UTCB definitions for ARM	2922
arm/l4/sys/vm	2949
arm/l4/sys/vm.h	
ARM virtualization interface	2116
arm/l4/util/bitops_arch.h	
ARM specific implementation of bitops functions	2121
arm/l4/util/cpu.h	
CPU related functions	2128
arm/l4/util/irq.h	
ARM specific implementation of irq functions	2817
arm/l4/util/l4_macros.h	
Main function	2131
arm/l4/util/mbi_argv.h	
Multiboot	2135
arm/l4f/l4/sys/ipc.h	
L4 IPC System Calls, ARM	2796
arm/l4f/l4/sys/syscall_defs.h	
Syscall entry definitions	2138
contrib/libio-io/l4/io/io.h	2139
contrib/libio-io/l4/io/types.h	2142
l4/cxx/alloc.h	
Alloc list	2149
l4/cxx/arith	2150
l4/cxx/atomic.h	
Atomic template	2152
l4/cxx/avl_map	
AVL map	2160
l4/cxx/avl_set	
AVL set	2163
l4/cxx/avl_tree	
AVL tree	2168
l4/cxx/basic_ostream	
Basic IO stream	2174
l4/cxx/basic_vector.h	
Basic vector	2178
l4/cxx/bitfield	2179
l4/cxx/bitmap	2182
l4/cxx/dlist	2204
l4/cxx/exceptions	
Base exceptions	2207
l4/cxx/hlist	2211
l4/cxx/iostream	
IO Stream	2214
l4/cxx/ipc_helper	
IPC helper	2215
l4/cxx/ipc_server	
IPC server loop	2217
l4/cxx/ipc_stream	
IPC stream	2223

l4/cxx/ <a href="#">ipc_timeout_queue</a>	2241
l4/cxx/ <a href="#">l4iostream</a>	
L4 IO stream	2243
l4/cxx/ <a href="#">l4types.h</a>	
L4 Types	2245
l4/cxx/ <a href="#">list</a>	2246
l4/cxx/ <a href="#">list_alloc</a>	2250
l4/cxx/ <a href="#">main_thread</a>	
Main thread	2256
l4/cxx/ <a href="#">minmax</a>	2258
l4/cxx/ <a href="#">observer</a>	2259
l4/cxx/ <a href="#">pair</a>	
Pair implementation	2259
l4/cxx/ <a href="#">ref_ptr</a>	2262
l4/cxx/ <a href="#">ref_ptr_list</a>	
Implementation of a list of ref-ptr-managed objects	2265
l4/cxx/ <a href="#">slab_alloc</a>	2267
l4/cxx/ <a href="#">slist</a>	2271
l4/cxx/ <a href="#">static_container</a>	2274
l4/cxx/ <a href="#">static_vector</a>	2274
l4/cxx/ <a href="#">std_alloc</a>	2275
l4/cxx/ <a href="#">std_exc_io</a>	
Base exceptions std stream operator	2276
l4/cxx/ <a href="#">std_ops</a>	2277
l4/cxx/ <a href="#">string</a>	2278
l4/cxx/ <a href="#">string.h</a>	
String	2281
l4/cxx/ <a href="#">thread</a>	
Thread implementation	2283
l4/cxx/ <a href="#">type_list</a>	2288
l4/cxx/ <a href="#">type_traits</a>	2288
l4/cxx/ <a href="#">unique_ptr</a>	2293
l4/cxx/ <a href="#">unique_ptr_list</a>	
Implementation of a list of unique-ptr-managed objects	2295
l4/cxx/ <a href="#">utils</a>	2297
l4/cxx/ <a href="#">weak_ref</a>	2297
l4/cxx/bits/ <a href="#">bst.h</a>	
AVL tree	2185

- file [consts.h](#)  
*Common L4 constants, x86 version.*

### 13.1.1 Detailed Description

Interfaces for all kinds of base functionality.

Some notes on Inter Process Communication (IPC)

IPC in L4 is always synchronous and unbuffered: a message is transferred from the sender to the recipient if and only if the recipient has invoked a corresponding IPC operation. The sender blocks until this happens or a timeout specified by the sender elapsed without the destination becoming ready to receive.

### 13.1.2 Basic Macros

L4 standard macros for header files, function definitions, and public APIs etc.

Collaboration diagram for Basic Macros:

#### Macros

- `#define L4_INLINE`  
*L4 Inline function attribute.*
- `#define L4_ALWAYS_INLINE`  
*Always inline a function.*
- `#define __BEGIN_DECLS`  
*Start section with C types and functions.*
- `#define __END_DECLS`  
*End section with C types and functions.*
- `#define EXTERN_C_BEGIN`  
*Start section with C types and functions.*
- `#define EXTERN_C_END`

- End section with C types and functions.*

  - **#define EXTERN\_C**  
*Mark C types and functions.*
  - **#define L4\_NOTHROW**  
*Mark a function declaration and definition as never throwing an exception.*
  - **#define L4\_EXPORT**  
*Attribute to mark functions, variables, and data types as being exported from a library.*
  - **#define L4\_HIDDEN**  
*Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.*
  - **#define L4\_CONSTEXPR**  
*Constexpr function attribute.*
  - **#define L4\_NORETURN**  
*Noreturn function attribute.*
  - **#define L4\_NOINSTRUMENT**  
*No instrumentation function attribute.*
  - **#define L4\_LIKELY(x)**  
*Expression is likely to execute.*
  - **#define L4\_UNLIKELY(x)**  
*Expression is unlikely to execute.*
  - **#define L4\_STICKY(x)**  
*Mark symbol sticky (even not there)*
  - **#define L4\_DEPRECATED(s)**  
*Mark symbol deprecated.*
  - **#define L4\_stringify\_helper(x)**  
*stringify helper.*
  - **#define L4\_stringify(x)**  
*stringify.*
  - **#define L4\_CV**  
*Define calling convention.*
  - **#define L4\_CV**  
*Define calling convention.*
  - **#define L4\_CV**  
*Define calling convention.*

## Functions

- unsigned long **l4\_align\_stack\_for\_direct\_fncall** (unsigned long stack)  
*Specify the desired alignment of the stack pointer.*
- void **l4\_barrier** (void)  
*Memory barrier.*
- void **l4\_mb** (void)  
*Memory barrier.*
- void **l4\_wmb** (void)  
*Write memory barrier.*
- **L4\_NORETURN** void **l4\_infinite\_loop** (void)  
*Infinite loop.*

### 13.1.2.1 Detailed Description

L4 standard macros for header files, function definitions, and public APIs etc.

#### Include File

```
#include <l4/sys/compiler.h>
```

### 13.1.2.2 Macro Definition Documentation

#### 13.1.2.2.1 L4\_EXPORT

```
#define L4_EXPORT
```

Attribute to mark functions, variables, and data types as being exported from a library.

All data types, functions, and global variables that shall be exported from a library shall be marked with this attribute. The default may become to hide everything that is not marked as L4\_EXPORT from the users of a library and provide the possibility for aggressive optimization of all those internal functionality of a library.

#### Usage:

```
class L4_EXPORT My_class
{
    ...
};

int L4_EXPORT function(void);

int L4_EXPORT global_data; // global data is not recommended
```

Definition at line 231 of file [compiler.h](#).

#### 13.1.2.2.2 L4\_HIDDEN

```
#define L4_HIDDEN
```

Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.

This attribute is intended for functions, data, and data types that shall never be visible outside of a library. In particular, for shared libraries this may result in much faster code within the library and short linking times.

```
class L4_HIDDEN My_class
{
    ...
};

int L4_HIDDEN function(void);

int L4_HIDDEN global_data; // global data is not recommended
```

Definition at line 228 of file [compiler.h](#).

### 13.1.2.2.3 L4\_NOTHROW

```
#define L4_NOTHROW
```

Mark a function declaration and definition as never throwing an exception.

(Also for C code).

This macro shall be used to mark C and C++ functions that never throw any exception. Note that also C functions may throw exceptions according to the compilers ABI and shall be marked with L4\_NOTHROW if they never do. In C++ this is equivalent to `throw()`.

```
int foo() L4_NOTHROW;
...
int foo() L4_NOTHROW
{
    ...
    return result;
}
```

Definition at line 188 of file [compiler.h](#).

### 13.1.2.3 Function Documentation

#### 13.1.2.3.1 l4\_align\_stack\_for\_direct\_fncall()

```
unsigned long l4_align_stack_for_direct_fncall (
    unsigned long stack ) [inline]
```

Specify the desired alignment of the stack pointer.

**BIGGEST\_ALIGNMENT** provides the largest alignment ever used for any data type on the target machine. This is normally identical to desired stack alignment. Align stack pointer for directly invoked functions.

The stack needs to be aligned to L4\_STACK\_ALIGN for being able to access certain data on the stack. On x86/AMD64, a function call is performed using the 'call' instruction decrementing the stack pointer and writing the return address onto the stack. The called function considers this when adapting the stack pointer after function entry. If the called function was not invoked by a 'call' instruction, the stack pointer is actually off by a machine word leading to stack alignment issues when executing SSE instructions.

This function fixes the stack pointer for directly invoked functions. For architectures not automatically pushing the stack pointer during a function call, just enforce the L4\_STACK\_ALIGN alignment.

Definition at line 285 of file [compiler.h](#).

#### 13.1.2.3.2 l4\_infinite\_loop()

```
L4_NORETURN void l4_infinite_loop (
    void ) [inline]
```

Infinite loop.

Will never return. Use [l4\\_sleep\\_forever\(\)](#) if at all possible.

Definition at line 359 of file [compiler.h](#).

References [l4\\_barrier\(\)](#).

Here is the call graph for this function:

### 13.1.3 C++ IPC Interface Definition.

APIs for defining IPC interfaces using C++ as language.

Collaboration diagram for C++ IPC Interface Definition.:

#### Modules

- [Internal Helpers](#)

#### Namespaces

- namespace [L4::Typeid](#)  
*Definition of interface data-type helpers.*

#### 13.1.3.1 Detailed Description

APIs for defining IPC interfaces using C++ as language.

#### 13.1.3.2 Internal Helpers

Collaboration diagram for Internal Helpers:

#### Data Structures

### 13.1.3.2.1 Detailed Description

## 13.1.4 Cache Consistency

Various functions for cache consistency.

Collaboration diagram for Cache Consistency:

### Functions

- `int l4_cache_clean_data` (unsigned long start, unsigned long end) [L4\\_NOTHROW](#)  
*Cache clean a range in D-cache; writes back to PoC.*
- `int l4_cache_flush_data` (unsigned long start, unsigned long end) [L4\\_NOTHROW](#)  
*Cache flush a range; writes back to PoC.*
- `int l4_cache_inv_data` (unsigned long start, unsigned long end) [L4\\_NOTHROW](#)  
*Cache invalidate a range; might write back to PoC.*
- `int l4_cache_coherent` (unsigned long start, unsigned long end) [L4\\_NOTHROW](#)  
*Make memory coherent between I-cache and D-cache; writes back to PoU.*
- `int l4_cache_dma_coherent` (unsigned long start, unsigned long end) [L4\\_NOTHROW](#)  
*Make memory coherent for use with external memory; writes back to PoC.*
- `int l4_cache_dma_coherent_full` (void) [L4\\_NOTHROW](#)  
*Make memory coherent for use with external memory; writes back to PoC.*

### 13.1.4.1 Detailed Description

Various functions for cache consistency.

These functions shall be used to ensure that

- all blocks (e.g. CPU cores, devices, DMA engines) are guaranteed to see the same copy of a memory location (Point of Coherency – PoC),
- instruction and data caches of a core are guaranteed to see the same copy of a memory location (Point of Unification – PoU).

Certain functions are NOPs on certain architectures, for example on Intel it's not necessary to explicitly make caches coherent to PoU.

### 13.1.4.2 Function Documentation

#### 13.1.4.2.1 `l4_cache_clean_data()`

```
int l4_cache_clean_data (
    unsigned long start,
    unsigned long end ) [inline]
```

Cache clean a range in D-cache; writes back to PoC.

**Parameters**

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

**Return values**

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines in the range but leaves them in the cache and marks the cached copies clean.

**Examples**

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#).

Definition at line [81](#) of file [cache.h](#).

**13.1.4.2.2 l4\_cache\_coherent()**

```
int l4_cache_coherent (
    unsigned long start,
    unsigned long end ) [inline]
```

Make memory coherent between I-cache and D-cache; writes back to PoU.

**Parameters**

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

**Return values**

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Definition at line [105](#) of file [cache.h](#).

**13.1.4.2.3 l4\_cache\_dma\_coherent()**

```
int l4_cache_dma_coherent (
    unsigned long start,
    unsigned long end ) [inline]
```

Make memory coherent for use with external memory; writes back to PoC.

## Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

## Return values

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Definition at line 113 of file [cache.h](#).

**13.1.4.2.4 l4\_cache\_flush\_data()**

```
int l4_cache_flush_data (
    unsigned long start,
    unsigned long end ) [inline]
```

Cache flush a range; writes back to PoC.

## Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

## Return values

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines and invalidates all cache entries in the range.

Definition at line 89 of file [cache.h](#).

**13.1.4.2.5 l4\_cache\_inv\_data()**

```
int l4_cache_inv_data (
    unsigned long start,
    unsigned long end ) [inline]
```

Cache invalidate a range; might write back to PoC.

## Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

## Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Invalidates all cache entries in the range but does not necessarily write back dirty cache lines.

## Note

Implementations may choose to write back dirty lines nonetheless if this is more efficient.

Definition at line 97 of file [cache.h](#).

### 13.1.5 Capabilities

C interface for capabilities.

Collaboration diagram for Capabilities:

#### Typedefs

- typedef unsigned long [l4\\_cap\\_idx\\_t](#)  
*Capability selector type.*

#### Enumerations

- enum [l4\\_cap\\_consts\\_t](#) {  
[L4\\_CAP\\_SHIFT](#) , [L4\\_CAP\\_SIZE](#) = 1UL << [L4\\_CAP\\_SHIFT](#) , [L4\\_CAP\\_OFFSET](#) , [L4\\_CAP\\_MASK](#) ,  
[L4\\_INVALID\\_CAP](#) , [L4\\_INVALID\\_CAP\\_BIT](#) = 1UL << ([L4\\_CAP\\_SHIFT](#) - 1) }  
*Constants related to capability selectors.*
- enum [l4\\_default\\_caps\\_t](#) {  
[L4\\_BASE\\_TASK\\_CAP](#) , [L4\\_BASE\\_FACTORY\\_CAP](#) , [L4\\_BASE\\_THREAD\\_CAP](#) , [L4\\_BASE\\_PAGER\\_CAP](#) ,  
[L4\\_BASE\\_LOG\\_CAP](#) , [L4\\_BASE\\_ICU\\_CAP](#) , [L4\\_BASE\\_SCHEDULER\\_CAP](#) , [L4\\_BASE\\_IOMMU\\_CAP](#) ,  
[L4\\_BASE\\_DEBUGGER\\_CAP](#) , [L4\\_BASE\\_ARM\\_SMCCC\\_CAP](#) , [L4\\_BASE\\_CAPS\\_LAST\\_P1](#) , [L4\\_BASE\\_CAPS\\_LAST](#)  
= [L4\\_BASE\\_CAPS\\_LAST\\_P1](#) - 1 }  
*Default capabilities setup for the initial tasks.*

## Functions

- unsigned [l4\\_is\\_invalid\\_cap](#) ([l4\\_cap\\_idx\\_t](#) c) [L4\\_NOTHROW](#)  
*Test if a capability selector is the invalid capability.*
- unsigned [l4\\_is\\_valid\\_cap](#) ([l4\\_cap\\_idx\\_t](#) c) [L4\\_NOTHROW](#)  
*Test if a capability selector is a valid selector.*
- unsigned [l4\\_capability\\_equal](#) ([l4\\_cap\\_idx\\_t](#) c1, [l4\\_cap\\_idx\\_t](#) c2) [L4\\_NOTHROW](#)  
*Test if the capability indices of two capability selectors are equal.*

### 13.1.5.1 Detailed Description

C interface for capabilities.

Add

```
#include <l4/sys/types.h>
#include <l4/sys/consts.h>
```

to your code to use the functions and definitions explained here.

### 13.1.5.2 Typedef Documentation

#### 13.1.5.2.1 [l4\\_cap\\_idx\\_t](#)

```
typedef unsigned long l4\_cap\_idx\_t
```

Capability selector type.

A capability selector is either a (shifted) capability index or the invalid capability selector [L4\\_INVALID\\_CAP](#).

Usage of the invalid capability selector is defined only for invoking IPC (see [Object Invocation](#)): When IPC is invoked on [L4\\_INVALID\\_CAP](#), then it is resolved to a capability for the current thread with full permissions.

Otherwise, the API assumes that each argument of type [l4\\_cap\\_idx\\_t](#) is a capability index, i.e., `idx << L4\_CAP\_SHIFT` for arbitrary `idx`. The behavior for other arguments is then undefined.

Definition at line [359](#) of file [types.h](#).

### 13.1.5.3 Enumeration Type Documentation

#### 13.1.5.3.1 [l4\\_cap\\_consts\\_t](#)

```
enum l4\_cap\_consts\_t
```

Constants related to capability selectors.

#### Enumerator

<a href="#">L4_CAP_SHIFT</a>	Capability index shift.
<a href="#">L4_CAP_SIZE</a>	
Generated for L4Re by Doxygen	<b>Deprecated</b> Superseded by <a href="#">L4_CAP_OFFSET</a> .
<a href="#">L4_CAP_OFFSET</a>	Offset of two consecutive capability selectors.
<a href="#">L4_CAP_MASK</a>	Mask to get only the relevant bits of an <a href="#">l4_cap_idx_t</a> .

Definition at line 154 of file [consts.h](#).

### 13.1.5.3.2 l4\_default\_caps\_t

```
enum l4_default_caps_t
```

Default capabilities setup for the initial tasks.

These capability selectors are setup per default by the micro kernel for the two initial tasks, the Root-Pager (Sigma0) and the Root-Task (Moe).

#### Attention

These constants do not have any particular meaning for applications started by Moe, see [Initial Environment](#) for this kind of information.

#### See also

[Initial Environment](#) for information useful for normal user applications.

#### Enumerator

L4_BASE_TASK_CAP	Capability selector for the current task.
L4_BASE_FACTORY_CAP	Capability selector for the factory.
L4_BASE_THREAD_CAP	Capability selector for the first thread.
L4_BASE_PAGER_CAP	Capability selector for the pager gate. For Sigma0, the pager is not present since it never raises page faults. For Moe, the pager is set to Sigma0.
L4_BASE_LOG_CAP	Capability selector for the log object. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ICU_CAP	Capability selector for the base icu object.
L4_BASE_SCHEDULER_CAP	Capability selector for the scheduler cap.
L4_BASE_IOMMU_CAP	Capability selector for the IO-MMU cap. Present if the microkernel detected an IO-MMU.
L4_BASE_DEBUGGER_CAP	Capability selector for the debugger cap. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ARM_SMCCC_CAP	Capability selector for the ARM SMCCC cap. Present if the microkernel detected an ARM SMC capable trusted execution environment.
L4_BASE_CAPS_LAST	Last capability index used for base capabilities.

Definition at line 313 of file [consts.h](#).

### 13.1.5.4 Function Documentation

#### 13.1.5.4.1 l4\_capability\_equal()

```
unsigned l4_capability_equal (
    l4_cap_idx_t c1,
    l4_cap_idx_t c2 ) [inline]
```

Test if the capability indices of two capability selectors are equal.

**Parameters**

<i>c1</i>	Capability selector.
<i>c2</i>	Capability selector.

**Return values**

0	The index parts of the capability selectors differ.
1	The index parts of the capability selectors are equal.

**Precondition**

Both capability selectors must be valid (cf. [l4\\_is\\_valid\\_cap\(\)](#)) otherwise the return value is undefined.

Definition at line 420 of file [types.h](#).

References [L4\\_CAP\\_SHIFT](#).

**13.1.5.4.2 l4\_is\_invalid\_cap()**

```
unsigned l4_is_invalid_cap (
    l4_cap_idx_t c ) [inline]
```

Test if a capability selector is the invalid capability.

**Parameters**

<i>c</i>	Capability selector
----------	---------------------

**Return values**

0	The capability selector is not the invalid capability.
>0	The capability selector is the invalid capability.

**Examples**

[examples/libs/l4re/c/ma+rm.c](#), [examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 412 of file [types.h](#).

**13.1.5.4.3 l4\_is\_valid\_cap()**

```
unsigned l4_is_valid_cap (
    l4_cap_idx_t c ) [inline]
```

Test if a capability selector is a valid selector.

## Parameters

<code>c</code>	Capability selector
----------------	---------------------

## Return values

<code>0</code>	The capability selector is not valid.
<code>&gt;0</code>	The capability selector is valid.

Definition at line 416 of file [types.h](#).

Referenced by [L4Re::Util::Cap\\_alloc\\_base::free\(\)](#), and [L4Re::Util::Counting\\_cap\\_alloc< COUNTERTYPE, Dbg >::free\(\)](#).

### 13.1.6 Error codes

Common error codes.

Collaboration diagram for Error codes:

## Enumerations

- enum [l4\\_error\\_code\\_t](#) {  
[L4\\_EOK](#) = 0 , [L4\\_EPERM](#) = 1 , [L4\\_ENOENT](#) = 2 , [L4\\_EIO](#) = 5 ,  
[L4\\_ENXIO](#) = 6 , [L4\\_E2BIG](#) = 7 , [L4\\_EAGAIN](#) = 11 , [L4\\_ENOMEM](#) = 12 ,  
[L4\\_EACCESS](#) = 13 , [L4\\_EFAULT](#) = 14 , [L4\\_EBUSY](#) = 16 , [L4\\_EEXIST](#) = 17 ,

```

L4_ENODEV = 19 , L4_ENOTDIR = 20 , L4_EINVAL = 22 , L4_ENOSPC = 28 ,
L4_ERANGE = 34 , L4_ENAMETOOLONG = 36 , L4_ENOSYS = 38 , L4_EBADPROTO = 39 ,
L4_EADDRNOTAVAIL = 99 , L4_ERRNOMAX = 100 , L4_ENOREPLY = 1000 , L4_MSGTOOSHORT =
1001 ,
L4_MSGTOOLONG = 1002 , L4_MSGMISSARG = 1003 , L4_EIPC_LO = 2000 , L4_EIPC_HI = 2000 +
0x1f }

```

*L4 error codes.*

### 13.1.6.1 Detailed Description

Common error codes.

#### Include File

```
#include <l4/sys/err.h>
```

### 13.1.6.2 Enumeration Type Documentation

#### 13.1.6.2.1 l4\_error\_code\_t

```
enum l4_error_code_t
```

*L4 error codes.*

Those error codes are used by both the kernel and the user programs.

#### Enumerator

L4_EOK	Ok.
L4_EPERM	No permission.
L4_ENOENT	No such entity.
L4_EIO	I/O error.
L4_ENXIO	No such device or address.
L4_E2BIG	Argument value too big.
L4_EAGAIN	Try again.
L4_ENOMEM	No memory.
L4_EACCESS	Permission denied.
L4_EFAULT	Invalid memory address.
L4_EBUSY	Object currently busy, try later.
L4_EEXIST	Already exists.
L4_ENODEV	No such thing.
L4_ENOTDIR	Not a directory.
L4_EINVAL	Invalid argument.
L4_ENOSPC	No space left on device.
L4_ERANGE	Range error.
L4_ENAMETOOLONG	Name too long.
L4_ENOSYS	No sys.
L4_EBADPROTO	Unsupported protocol.
L4_EADDRNOTAVAIL	Address not available.
L4_ERRNOMAX	Maximum error value.

## Enumerator

L4_ENOREPLY	No reply.
L4_MSGTOOSHORT	Message too short.
L4_MSGTOOLONG	Message too long.
L4_MSGMISSARG	Message has invalid capability.
L4_EIPC_LO	Communication error-range low.
L4_EIPC_HI	Communication error-range high.

Definition at line 41 of file [err.h](#).

### 13.1.7 Fiasco extensions

Extensions of the Fiasco [L4](#) implementation.

Collaboration diagram for Fiasco extensions:

### Modules

- [Fiasco real time scheduling extensions](#)  
*Real time scheduling extension for the Fiasco L4 implementation.*
- [Kernel Debugger](#)  
*Kernel debugger related functionality.*
- [Kernel Tracing](#)  
*Kernel tracing related functionality.*

### Files

- file [segment.h](#)  
*l4f specific fs/gs manipulation*
- file [segment.h](#)  
*l4f specific segment manipulation*

## Functions

- long `fiasco_ldt_set` (`l4_cap_idx_t` task, void \*ldt, unsigned int num\_desc, unsigned int entry\_number\_start, `l4_utcb_t` \*utcb)  
*Set LDT segments descriptors.*
- long `fiasco_gdt_set` (`l4_cap_idx_t` thread, void \*desc, unsigned int size, unsigned int entry\_number\_start, `l4_utcb_t` \*utcb)  
*Set GDT segment descriptors.*
- unsigned `fiasco_gdt_get_entry_offset` (`l4_cap_idx_t` thread, `l4_utcb_t` \*utcb)  
*Return the offset of the entry in the GDT.*

### 13.1.7.1 Detailed Description

Extensions of the Fiasco L4 implementation.

### 13.1.7.2 Function Documentation

#### 13.1.7.2.1 `fiasco_gdt_get_entry_offset()`

```
unsigned fiasco_gdt_get_entry_offset (
    l4_cap_idx_t thread,
    l4_utcb_t * utcb ) [inline]
```

Return the offset of the entry in the GDT.

#### Parameters

<i>thread</i>	Thread to get info from.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Definition at line 177 of file [segment.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_THREAD](#), [L4\\_THREAD\\_X86\\_GDT\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

Here is the call graph for this function:

### 13.1.7.2.2 `fiasco_gdt_set()`

```
long fiasco_gdt_set (
    l4_cap_idx_t thread,
    void * desc,
    unsigned int size,
    unsigned int entry_number_start,
    l4_utcb_t * utcb ) [inline]
```

Set GDT segment descriptors.

Fiasco supports 4 consecutive entries, starting at the value returned by `fiasco_gdt_get_entry_offset()`.

#### Parameters

<i>thread</i>	Thread to set the GDT entry for.
<i>desc</i>	Pointer to GDT descriptors.
<i>size</i>	Size of the descriptors in bytes (multiple of 8).
<i>entry_number_start</i>	Entry number to start (valid values: 0-3).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

<code>&lt; 0</code>	At least one provided GDT descriptor is considered unsafe by the kernel, and not all selected GDT descriptors have been updated.
<code>L4_EOK</code>	Success.

Definition at line 52 of file [segment.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_THREAD](#), [L4\\_THREAD\\_X86\\_GDT\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

Here is the call graph for this function:

### 13.1.7.2.3 `fiasco_ldt_set()`

```
long fiasco_ldt_set (
    l4_cap_idx_t task,
```

```
void * ldt,
unsigned int num_desc,
unsigned int entry_number_start,
l4_utcb_t * utcb ) [inline]
```

Set LDT segments descriptors.

#### Parameters

<i>task</i>	Task to set the segment for.
<i>ldt</i>	Pointer to LDT hardware descriptors.
<i>num_desc</i>	Number of descriptors.
<i>entry_number_start</i>	Entry number to start.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

<i>-L4_ENOSYS</i>	The kernel configuration doesn't support this feature.
<i>-L4_EINVAL</i>	Invalid descriptor or invalid entry number.
<i>L4_EOK</i>	Success.

#### Note

This feature is not available if the kernel is configured with page table isolation.

Definition at line 164 of file [segment.h](#).

References [L4\\_EINVAL](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_TASK](#), [L4\\_TASK\\_LDT\\_SET\\_X86\\_OP](#), [L4\\_TASK\\_LDT\\_X86\\_ENTRY\\_SIZE](#), [L4\\_TASK\\_LDT\\_X86\\_MAX\\_ENTRIES](#), and [l4\\_msg\\_regs\\_t::mr](#).

*Add loaded image information for a task.*

#### 13.1.7.4.1 Detailed Description

Kernel debugger related functionality.

##### Attention

This API is subject to change!

This is a debugging facility, any call to any function might be invalid. Do not rely on it in any real code.

##### Include File

```
#include <l4/sys/debugger.h>
```

#### 13.1.7.4.2 Function Documentation

##### 13.1.7.4.2.1 l4\_debugger\_add\_image\_info()

```
l4_msgtag_t l4_debugger_add_image_info (
    l4_cap_idx_t cap,
    l4_addr_t base,
    const char * name ) [inline]
```

Add loaded image information for a task.

##### Parameters

<i>cap</i>	Capability which refers to the task object.
<i>base</i>	Load base address of image.
<i>name</i>	Image base name.

This is a debugging facility, the call might be invalid.

Definition at line 428 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

### 13.1.7.4.2.2 l4\_debugger\_get\_object\_name()

```
l4_msgtag_t l4_debugger_get_object_name (
    l4_cap_idx_t cap,
    unsigned id,
    char * name,
    unsigned size ) [inline]
```

Get name of the kernel object with Id `id`.

#### Parameters

	<i>cap</i>	Capability of the debugger object.
	<i>id</i>	Global id of the object whose name is asked.
out	<i>name</i>	Buffer to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <code>name</code> buffer.

#### Returns

Syscall return tag

Definition at line 421 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.7.4.2.3 l4\_debugger\_global\_id()

```
unsigned long l4_debugger_global_id (
    l4_cap_idx_t cap ) [inline]
```

Get the globally unique ID of the object behind a capability.

#### Parameters

<i>cap</i>	Capability
------------	------------

#### Return values

<code>~0UL</code>	Capability is not valid.
-------------------	--------------------------

## Return values

<i>otherwise</i>	Global debugger id.
------------------	---------------------

This is a debugging facility, the call might be invalid.

Definition at line 386 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## 13.1.7.4.2.4 l4\_debugger\_kobj\_to\_id()

```

unsigned long l4_debugger_kobj_to_id (
    l4_cap_idx_t cap,
    l4_addr_t kobjp ) [inline]
  
```

Get the globally unique ID of the object behind the kobject pointer.

## Parameters

<i>cap</i>	Capability
<i>kobjp</i>	Kobject pointer

## Return values

$\sim 0UL$	The capability or the kobject pointer are invalid.
<i>otherwise</i>	The globally unique id.

This is a debugging facility, the call might be invalid.

Definition at line 392 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.7.4.2.5 l4\_debugger\_query\_log\_name()

```
long l4_debugger_query_log_name (
    l4_cap_idx_t cap,
    unsigned idx,
    char * name,
    unsigned namelen,
    char * shortname,
    unsigned shortnamelen ) [inline]
```

Query the name of a log type given the ID.

##### Parameters

<i>cap</i>	Debugger capability.
<i>idx</i>	ID to query.
<i>name</i>	Buffer to copy name to.
<i>namelen</i>	Buffer length of name.
<i>shortname</i>	Buffer to copy shortname to.
<i>shortnamelen</i>	Buffer length of shortname.

##### Return values

0	Success
<0	Error

This is a debugging facility, the call might be invalid.

Definition at line 405 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

#### 13.1.7.4.2.6 l4\_debugger\_query\_log\_typeid()

```
long l4_debugger_query_log_typeid (
    l4_cap_idx_t cap,
    const char * name,
    unsigned idx ) [inline]
```

Query the log-id for a log type.

##### Parameters

<i>cap</i>	Debugger capability
<i>name</i>	Name to query for.
<i>idx</i>	Idx to start searching, start with 0

##### Returns

positive ID, or negative error code

This is a debugging facility, the call might be invalid.

Definition at line 398 of file [debugger.h](#).

References [l4\\_utcb\(\)](#).

#### 13.1.7.4.2.7 l4\_debugger\_set\_object\_name()

```
l4_msgtag_t l4_debugger_set_object_name (
    l4_cap_idx_t cap,
    const char * name ) [inline]
```

Set the name of a kernel object.

##### Parameters

<i>cap</i>	Capability which refers to the kernel object.
<i>name</i>	Name of the kernel object that is e.g. displayed in the kernel debugger.

This is a debugging facility, the call might be invalid.

##### Examples

[examples/libs/shmc/prodcons.c](#), and [examples/sys/aliens/main.c](#).

```
l4_msgtag_t l4_debugger_switch_log (
    l4_cap_idx_t cap,
    const char * name,
    int on_off ) [inline]
```

Set or unset log.

##### Parameters

<i>cap</i>	Debugger object.
<i>name</i>	Name of the log type.
<i>on_off</i>	1: turn log on, 0: turn log off

**Returns**

Syscall return tag

Definition at line 414 of file [debugger.h](#).

### 13.1.7.5.1 Detailed Description

Kernel tracing related functionality.

#### Attention

This API is subject to change!

This is a tracing facility for the Fiasco kernel trace buffer. Any call to any function might be invalid. Do not rely on it in any real code.

#### Include File

```
#include <l4/sys/ktrace.h>
```

### 13.1.7.5.2 Function Documentation

#### 13.1.7.5.2.1 fiasco\_tbuf\_log()

```
l4_umword_t fiasco_tbuf_log (
    const char * text ) [inline]
```

Create new trace-buffer entry with describing <text>.

#### Parameters

<i>text</i>	Logging text
-------------	--------------

#### Returns

Pointer to trace-buffer entry

Definition at line 35 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_kdebug\\_text\(\)](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

### 13.1.7.5.2.2 fiasco\_tbuf\_log\_3val()

```
l4_umword_t fiasco_tbuf_log_3val (
    const char * text,
    l4_umword_t v1,
    l4_umword_t v2,
    l4_umword_t v3 ) [inline]
```

Create new trace-buffer entry with describing <text> and three additional values.

#### Parameters

<i>text</i>	Logging text
<i>v1</i>	first value
<i>v2</i>	second value
<i>v3</i>	third value

#### Returns

Pointer to trace-buffer entry

Definition at line 42 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_kdebug\\_3\\_text\(\)](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

### 13.1.7.5.2.3 fiasco\_tbuf\_log\_binary()

```
l4_umword_t fiasco_tbuf_log_binary (
    const unsigned char * data ) [inline]
```

Create new trace-buffer entry with binary data.

#### Parameters

<i>data</i>	binary data
-------------	-------------

**Returns**

Pointer to trace-buffer entry

Definition at line 65 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_kdebug\\_text\(\)](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

**13.1.8 Flex pages**

Flex-page related API.

- Determine maximum flex page size of a region.*

### 13.1.8.1 Detailed Description

Flex-page related API.

A flex page is a page with a variable size, that can describe memory, IO-Ports (IA32 only), and sets of kernel objects.

A flex page describes an always size aligned region of an address space. The size is given in a log2 scale. This means the size in elements (bytes for memory, ports for IO-Ports, and capabilities for kernel objects) is always a power of two.

A flex page also carries type and access right information for the described region. The type information selects the address space in which the flex page is valid. Access rights have a meaning depending on the specific address space (type).

There exists a special type for defining *receive windows* or for the [l4\\_task\\_unmap\(\)](#) method, that can be used to describe all address spaces (all types) with a single flex page.

### 13.1.8.2 Enumeration Type Documentation

#### 13.1.8.2.1 anonymous enum

`anonymous enum`

Constants for flexpages.

## Enumerator

L4_WHOLE_ADDRESS_SPACE	Whole address space size. This value does not only specify the log2 size of the biggest possible memory flex page. It can be also used as size for a special flex page to define a flex page which completely covers all spaces.
------------------------	--

Definition at line 93 of file [\\_\\_l4\\_fpage.h](#).

## 13.1.8.2.2 anonymous enum

anonymous enum

Special constants for IO flex pages.

## Enumerator

L4_WHOLE_IOADDRESS_SPACE	Whole I/O address space size. In contrast to <a href="#">L4_WHOLE_ADDRESS_SPACE</a> , this value forms the log2 size of the biggest possible I/O flex page.
L4_IOPORT_MAX	Maximum I/O port address plus 1.

Definition at line 304 of file [\\_\\_l4\\_fpage.h](#).

## 13.1.8.2.3 L4\_cap\_fpage\_rights

enum [L4\\_cap\\_fpage\\_rights](#)

Cap-flex-page rights.

Capabilities are modified or transfered with map and unmap operations. For that capabilities are wrapped into flex-page objects. The flex-page carries a set of rights the sender wants to hand over to the receiver along with the capability.

For the user only the 'S' and the 'W' right are visible. Other rights such as the 'D' right are internal to the corresponding kernel object and cannot be evaluated by the receiver.

## Note

A thread can also map a capability from its task's capability table with a reduced set of rights into another slot of its own capability table.

## Enumerator

L4_CAP_FPAGE_W	Interface specific 'W' right for capability flex-pages. The semantics of the 'W' right is defined by the protocol. For example in case of a dataspace cap, the 'W' right is needed to get a writable dataspace.
L4_CAP_FPAGE_S	Interface specific 'S' right for capability flex-pages. The semantics of the 'S' right is defined by the interface. When transferring object capabilities via IPC, the kernel masks this right with the 'S' right of the capability used to address the IPC partner. Thus, the 'S' right of sent capabilities is only transferred if both the flex-page and the IPC gate or thread capability specifying the IPC partner have the 'S' right. For <a href="#">L4::Task::map()</a> , the 'S' right is only transferred if the flex-page, the source and destination task capabilities have the 'S' right.
Generated for L4Re by Doxygen	

## Enumerator

L4_CAP_FPAGE_R	Read right for capability flex-pages. This is always required, otherwise no capability is mapped.
L4_CAP_FPAGE_RO	Read right for capability flex-pages. This is always required, otherwise no capability is mapped.
L4_CAP_FPAGE_D	Delete right for capability flex-pages. This allows the receiver to delete the corresponding kernel object using <code>unmap()</code> regardless of other tasks still holding a capability to the kernel object. Such capabilities are set to an empty capability if the object is deleted.
L4_CAP_FPAGE_RW	Read and interface specific 'W' right for capability flex-pages. The semantics of the 'W' right is defined by the interface.  See also <a href="#">L4_CAP_FPAGE_W</a>
L4_CAP_FPAGE_RS	Read and interface specific 'S' right for capability flex-pages. The semantics of the 'S' right is defined by the interface.  See also <a href="#">L4_CAP_FPAGE_S</a>
L4_CAP_FPAGE_RWS	Read, interface specific 'W', and 'S' rights for capability flex-pages. The semantics of the 'W' and 'S' right are defined by the interface.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , and <a href="#">L4_CAP_FPAGE_S</a>
L4_CAP_FPAGE_RWSD	Full rights for capability flex-pages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , <a href="#">L4_CAP_FPAGE_S</a> , and <a href="#">L4_CAP_FPAGE_D</a>
L4_CAP_FPAGE_RWD	Read, write, and delete right for capability flex-pages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , and <a href="#">L4_CAP_FPAGE_D</a>
L4_CAP_FPAGE_RSD	Read, 'S', and delete right for capability flex-pages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_S</a> , and <a href="#">L4_CAP_FPAGE_D</a>

Definition at line 151 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.8.2.4 l4\_fpage\_cacheability\_opt\_t

```
enum l4_fpage_cacheability_opt_t
```

Flex-page cacheability option.

## Enumerator

L4_FPAGE_CACHE_OPT	Enable the cacheability option in a send flex page.
L4_FPAGE_CACHEABLE	Cacheability option to enable caches for the mapping.
L4_FPAGE_BUFFERABLE	Cacheability option to enable buffered writes for the mapping.
L4_FPAGE_UNCACHEABLE	Cacheability option to disable caching for the mapping.

Definition at line 285 of file [\\_\\_l4\\_fpage.h](#).

## 13.1.8.2.5 L4\_fpage\_consts

enum [L4\\_fpage\\_consts](#)

[L4](#) flexpage structure.

## Enumerator

L4_FPAGE_RIGHTS_SHIFT	Access permissions shift.
L4_FPAGE_TYPE_SHIFT	Flexpage type shift (memory, IO port, obj...)
L4_FPAGE_SIZE_SHIFT	Flexpage size shift (log2-based)
L4_FPAGE_ADDR_SHIFT	Page address shift.
L4_FPAGE_RIGHTS_BITS	Access permissions size.
L4_FPAGE_TYPE_BITS	Flexpage type size (memory, IO port, obj...)
L4_FPAGE_SIZE_BITS	Flexpage size size (log2-based)
L4_FPAGE_ADDR_BITS	Page address size.
L4_FPAGE_RIGHTS_MASK	Mask to get the flexpage rights.
L4_FPAGE_RIGHTS_ALL	Specify as flexpage rights during grant.

Definition at line 57 of file [\\_\\_l4\\_fpage.h](#).

## 13.1.8.2.6 L4\_fpage\_control

enum [L4\\_fpage\\_control](#)

Flex-page map control flags.

## Enumerator

L4_FPAGE_CONTROL_OFFSET_SHIFT	Number of bits an index must be shifted or an address must be aligned to in the control word.
L4_FPAGE_CONTROL_MASK	Mask for truncating the lower bits of the send base or the index of the control word.

Definition at line 244 of file [\\_\\_l4\\_fpage.h](#).

### 13.1.8.2.7 L4\_fpage\_rights

enum [L4\\_fpage\\_rights](#)

Memory and IO port flex-page rights.

For IO flexpages, bit 1 and bit 2 are a combined read/write right. In a map operation, the receiver receives the IO port capability when the sender possesses it and at least one of these bits is present. For an unmap operation, the absence of one of those bits is sufficient to unmap the IO port capability.

#### Enumerator

L4_FPAGE_X	Executable flex page.
L4_FPAGE_W	Writable flex page.
L4_FPAGE_RO	Read-only flex page
L4_FPAGE_RW	Read-write flex page.
L4_FPAGE_RX	Read-execute flex page.
L4_FPAGE_RWX	Read-write-execute flex page.

Definition at line [124](#) of file [\\_\\_l4\\_fpage.h](#).

### 13.1.8.2.8 L4\_fpage\_type

enum [L4\\_fpage\\_type](#)

Flex-page type.

#### Enumerator

L4_FPAGE_SPECIAL	Special flex page, either invalid or all spaces.
L4_FPAGE_MEMORY	Memory flex page.
L4_FPAGE_IO	IO-port flex page.
L4_FPAGE_OBJ	Object flex page (capabilities).

Definition at line [233](#) of file [\\_\\_l4\\_fpage.h](#).

### 13.1.8.2.9 L4\_obj\_fpage\_ctl

enum [L4\\_obj\\_fpage\\_ctl](#)

Flex-page map control for capabilities (snd\_base)

These rights need to be added to the snd\_base when mapping and control internal behavior. The exact meaning depends on the type of capability (currently used only with IPC gates).

#### Enumerator

L4_FPAGE_C_REF_CNT	Mapping is reference-counted (default).
--------------------	---

## Enumerator

L4_FPAGE_C_NO_REF_CNT	Don't increase the reference counter.
L4_FPAGE_C_OBJ_RIGHT1	Object-type specific right.
L4_FPAGE_C_OBJ_RIGHT2	Object-type specific right.
L4_FPAGE_C_OBJ_RIGHT3	Object-type specific right.
L4_FPAGE_C_OBJ_RIGHTS	All Object-type specific right bits.
L4_FPAGE_C_IPCGATE_SVR	The receiver may invoke IPC-gate-specific functions on the capability, e.g. bind a thread to the gate and modify the label. Needed if the receiver implements the server side of an IPC gate.

Definition at line 263 of file [\\_\\_l4\\_fpage.h](#).

## 13.1.8.3 Function Documentation

## 13.1.8.3.1 l4\_fpage()

```
l4_fpage_t l4_fpage (
    l4_addr_t address,
    unsigned int size,
    unsigned char rights ) [inline]
```

Create a memory flex page.

## Parameters

<i>address</i>	Flex-page start address
<i>size</i>	Flex-page size (log2), <a href="#">L4_WHOLE_ADDRESS_SPACE</a> to specify the whole address space (with <code>address</code> 0). The minimum log2 size of a memory flex page is defined by <a href="#">L4_LOG2_PAGESIZE</a> according to the size of the smallest virtual page supported by the MMU.
<i>rights</i>	Access rights, see <a href="#">L4_fpage_rights</a>

## Returns

Memory flex page

Definition at line 668 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_MEMORY](#).

Referenced by [L4Re::Util::Dataspace\\_svr::map\(\)](#).

Here is the caller graph for this function:

### 13.1.8.3.2 l4\_fpage\_all()

```
l4_fpage_t l4_fpage_all (
    void ) [inline]
```

Get a flex page, describing all address spaces at once.

#### Returns

Special *all-spaces* flex page.

#### Note

This flex page can be used to define a receive window where the sender can send objects of any type, or for an unmap item completely covering all spaces of the target task. It does not make sense to use this flex page as send item.

Definition at line 688 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_SPECIAL](#), and [L4\\_WHOLE\\_ADDRESS\\_SPACE](#).

### 13.1.8.3.3 l4\_fpage\_contains()

```
int l4_fpage_contains (
    l4_fpage_t fpage,
    l4_addr_t addr,
    unsigned size ) [inline]
```

Test whether a given range is completely within an fpage.

#### Parameters

<i>fpage</i>	Flex page
<i>addr</i>	Address
<i>size</i>	Size of range in log2.

#### Return values

<i>==0</i>	The range is not completely in the fpage.
<i>!=0</i>	The range is within the fpage.

Definition at line 720 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_fpage\\_memaddr\(\)](#), and [l4\\_fpage\\_size\(\)](#).

Here is the call graph for this function:

#### 13.1.8.3.4 `l4_fpage_invalid()`

```
l4_fpage_t l4_fpage_invalid (
    void ) [inline]
```

Get an invalid flex page.

##### Returns

Special *invalid* flex page.

Definition at line 694 of file `__l4_fpage.h`.

References `L4_FPAGE_SPECIAL`.

#### 13.1.8.3.5 `l4_fpage_ioport()`

```
unsigned long l4_fpage_ioport (
    l4_fpage_t f ) [inline]
```

Return the IO port number from the IO flex page.

##### Parameters

<i>f</i>	Flex page
----------	-----------

##### Returns

IO port number from the given IO flex page.

##### Precondition

*f* must be an IO flex page (`l4_fpage_type(f) == L4_FPAGE_IO`) and

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.

Definition at line 624 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_ADDR\\_SHIFT](#).

### 13.1.8.3.6 l4\_fpage\_max\_order()

```
unsigned char l4_fpage_max_order (
    unsigned char order,
    l4_addr_t addr,
    l4_addr_t min_addr,
    l4_addr_t max_addr,
    l4_addr_t hotspot = 0 ) [inline]
```

Determine maximum flex page size of a region.

#### Parameters

<i>order</i>	Order value to start with (e.g. for memory L4_LOG2_PAGESIZE would be used)
<i>addr</i>	Address to be covered by the flex page.
<i>min_addr</i>	Start of region / minimal address (including).
<i>max_addr</i>	End of region / maximal address (excluding).
<i>hotspot</i>	(Optional) hot spot.

#### Returns

Maximum order (log2-size) possible.

#### Note

The start address of the flex-page can be determined with `l4_trunc_size(addr, returnvalue)`

Definition at line 728 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_trunc\\_size\(\)](#).

Here is the call graph for this function:

#### 13.1.8.3.7 l4\_fpage\_memaddr()

```
l4_addr_t l4_fpage_memaddr (
    l4_fpage_t f ) [inline]
```

Return the memory address from the memory flex page.

**Parameters**

<i>f</i>	Flex page
----------	-----------

**Returns**

Page address from the given memory flex page.

**Precondition**

*f* must be a memory flex page (`l4_fpage_type(f) == L4_FPAGE_MEMORY`).

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.

Definition at line 630 of file [\\_\\_l4\\_fpage.h](#).

Referenced by [l4\\_fpage\\_contains\(\)](#).

Here is the caller graph for this function:

**13.1.8.3.8 l4\_fpage\_obj()**

```
l4_cap_idx_t l4_fpage_obj (
    l4_fpage_t f ) [inline]
```

Return the capability index from the object flex page.

**Parameters**

<i>f</i>	Flex page
----------	-----------

**Returns**

Capability index from the given object flex page.

**Precondition**

`f` must be an object flex page (`l4_fpage_type(f) == L4_FPAGE_OBJ`)

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.

Definition at line 636 of file [\\_\\_l4\\_fpage.h](#).

**13.1.8.3.9 l4\_fpage\_page()**

```
unsigned long l4_fpage_page (
    l4_fpage_t f ) [inline]
```

Return the page part from a flex page.

**Parameters**

<code>f</code>	Flex page
----------------	-----------

**Returns**

Page part of the given flex page.

**Note**

The meaning of the page part depends on the flex-page type.

Definition at line 618 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_ADDR\\_SHIFT](#).

**13.1.8.3.10 l4\_fpage\_rights()**

```
unsigned l4_fpage_rights (
    l4_fpage_t f ) [inline]
```

Return rights from a flex page.

**Parameters**

<code>f</code>	Flex page
----------------	-----------

**Returns**

Size part of the given flex page.

Definition at line 600 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_RIGHTS\\_MASK](#), and [L4\\_FPAGE\\_RIGHTS\\_SHIFT](#).

Referenced by [l4\\_is\\_fpage\\_writable\(\)](#).

Here is the caller graph for this function:

#### 13.1.8.3.11 l4\_fpage\_set\_rights()

```
l4_fpage_t l4_fpage_set_rights (
    l4_fpage_t src,
    unsigned char new_rights ) [inline]
```

Set new right in a flex page.

##### Parameters

<i>src</i>	Flex page
<i>new_rights</i>	New rights

##### Returns

Modified flex page with new rights.

Definition at line 659 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_RIGHTS\\_MASK](#), [L4\\_FPAGE\\_RIGHTS\\_SHIFT](#), and [l4\\_fpage\\_t::raw](#).

#### 13.1.8.3.12 l4\_fpage\_size()

```
unsigned l4_fpage_size (
    l4_fpage_t f ) [inline]
```

Return size from a flex page.

##### Parameters

<i>f</i>	Flex page
----------	-----------

**Returns**

Size part of the given flex page.

**See also**

[l4\\_fpage\\_memaddr\(\)](#), [l4\\_fpage\\_obj\(\)](#), [l4\\_fpage\\_ioport\(\)](#)

Definition at line 612 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_SIZE\\_SHIFT](#).

Referenced by [l4\\_fpage\\_contains\(\)](#).

Here is the caller graph for this function:

**13.1.8.3.13 l4\_fpage\_type()**

```
unsigned l4_fpage_type (
    l4_fpage_t f ) [inline]
```

Return type from a flex page.

**Parameters**

<i>f</i>	Flex page
----------	-----------

**Returns**

Type part of the given flex page.

Definition at line 606 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_TYPE\\_SHIFT](#).

**13.1.8.3.14 l4\_iofpage()**

```
l4_fpage_t l4_iofpage (
    unsigned long port,
    unsigned int size ) [inline]
```

Create an IO-port flex page.

## Parameters

<i>port</i>	I/O-flex-page port base
<i>size</i>	I/O-flex-page size (log2), <a href="#">L4_WHOLE_IOADDRESS_SPACE</a> to specify the whole I/O address space (with <code>port 0</code> )

## Returns

I/O flex page

Definition at line 674 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_ADDR\\_SHIFT](#), [L4\\_FPAGE\\_IO](#), and [L4\\_FPAGE\\_RW](#).

Referenced by [l4util\\_ioport\\_map\(\)](#).

Here is the caller graph for this function:

### 13.1.8.3.15 l4\_is\_fpage\_writable()

```
int l4_is_fpage_writable (
    l4\_fpage\_t fp ) [inline]
```

Test if the flex page is writable.

## Parameters

<i>fp</i>	Flex page.
-----------	------------

## Return values

<i>!=0</i>	if flex page is writable.
<i>==0</i>	if flex pags is not writable.

Definition at line 701 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_fpage\\_rights\(\)](#), and [L4\\_FPAGE\\_W](#).

Here is the call graph for this function:

### 13.1.8.3.16 l4\_obj\_fpage()

```

l4_fpage_t l4_obj_fpage (
    l4_cap_idx_t obj,
    unsigned int order,
    unsigned char rights ) [inline]
  
```

Create a kernel-object flex page.

#### Parameters

<i>obj</i>	Base capability selector.
<i>order</i>	Log2 size (number of capabilities).
<i>rights</i>	Access rights, see <a href="#">L4_cap_fpage_rights</a>

#### Returns

Flex page for a set of kernel objects.

#### Note

[L4\\_CAP\\_FPAGE\\_R](#) is always required, otherwise no capability is mapped.

#### Examples

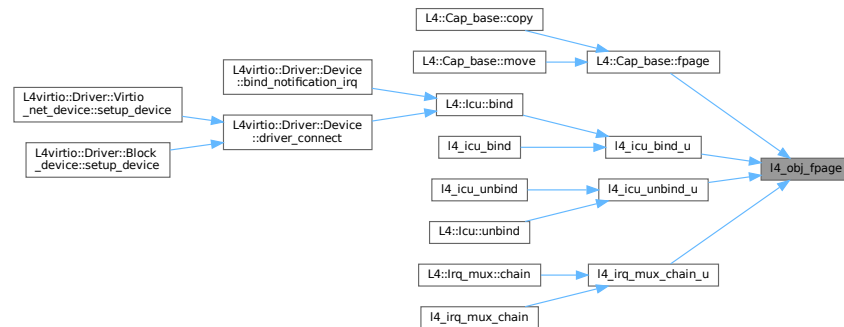

[examples/sys/utcb-ipc/main.c](#).

Definition at line 680 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_CAP\\_SHIFT](#), [L4\\_FPAGE\\_ADDR\\_SHIFT](#), and [L4\\_FPAGE\\_OBJ](#).

### 13.1.10.1 Detailed Description

Kernel Interface Page.

C interface for the Kernel Interface Page:

C++ interface for the Kernel Interface Page:

#### Include File

```
#include <l4/sys/kip>
```

#### Include File

```
#include <l4/sys/kip.h>
```

### 13.1.10.2 Enumeration Type Documentation

#### 13.1.10.2.1 anonymous enum

anonymous enum

#### Enumerator

L4_KIP_OFFS_READ_US	Offset of KIP code (provided by the kernel) for reading the KIP clock in microseconds. If the kernel is configured for a fine-grained KIP clock (CONFIG_SYNC_TSC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with microseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into microseconds. Otherwise this code just reads the KIP clock value.
L4_KIP_OFFS_READ_NS	Offset of KIP code (provided by the kernel) for reading the time stamp counter and transforming this value into nanoseconds. If the kernel is configured for fine-grained KIP clock (CONFIG_SYNC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with nanoseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into nanoseconds. Otherwise this code just reads the KIP clock value and multiplies it by 1000.
Generated for L4Re by Doxygen	

Definition at line 64 of file [kip.h](#).

### 13.1.10.3 Function Documentation

#### 13.1.10.3.1 l4\_kernel\_info\_version\_offset()

```
int l4_kernel_info_version_offset (
    l4_kernel_info_t const * kip ) [inline]
```

Return offset in bytes of version\_strings relative to the KIP base.

##### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

##### Returns

offset of version\_strings relative to the KIP base address, in bytes.

Definition at line 207 of file [kip.h](#).

Referenced by [l4\\_kip\\_version\\_string\(\)](#).

Here is the caller graph for this function:

#### 13.1.10.3.2 l4\_kip()

```
l4_kernel_info_t const * l4_kip (
    void ) [inline]
```

Get Kernel Info Page.

##### Returns

Pointer to Kernel Info Page (KIP) structure.

Definition at line 195 of file [kip.h](#).

Referenced by [l4re\\_kip\(\)](#).

Here is the caller graph for this function:

### 13.1.10.3.3 l4\_kip\_clock()

```
l4_cpu_time_t l4_kip_clock (
    l4_kernel_info_t const * kip ) [inline]
```

Return clock value from the KIP.

#### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

#### Returns

Value of the clock field in the KIP.

The KIP clock always contains the current (relative) time in micro seconds independently of the CPU frequency. The clock is only guaranteed to be accurate within the scheduling granularity announced in the KIP.

This function basically calls the KIP code for reading the KIP clock with microseconds resolution. The accuracy depends on the platform and the kernel configuration.

#### See also

[L4\\_KIP\\_OFFS\\_READ\\_US](#).

#### Examples

[examples/libs/shmc/prodcons.c](#).

Definition at line 211 of file [kip.h](#).

Referenced by [l4\\_kip\\_clock\\_lw\(\)](#), [L4::Poll\\_timeout\\_kipclock::set\(\)](#), and [L4::Poll\\_timeout\\_kipclock::test\(\)](#).

Here is the caller graph for this function:

### 13.1.10.3.4 l4\_kip\_clock\_lw()

```
l4_umword_t l4_kip_clock_lw (
    l4_kernel_info_t const * kip ) [inline]
```

Return least significant machine word of clock value from the KIP.

**Parameters**

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

**Returns**

Lower machine word of clock value from the KIP.

**Deprecated** Use [l4\\_kip\\_clock\(\)](#) instead.

This function will always provide the least significant machine word of the clock value from the KIP, regardless of the kernel configuration.

Definition at line 230 of file [kip.h](#).

References [l4\\_kip\\_clock\(\)](#).

Here is the call graph for this function:

**13.1.10.3.5 l4\_kip\_clock\_ns()**

```
l4_cpu_time_t l4_kip_clock_ns (  
    l4_kernel_info_t const * kip ) [inline]
```

Return current clock using the KIP in nanoseconds.

**Parameters**

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

**Returns**

Value of the current clock in nanoseconds.

This function basically calls the KIP code for reading the KIP clock with nanoseconds resolution. The accuracy depends on the platform and the kernel configuration.

See also

[L4\\_KIP\\_OFFS\\_READ\\_NS](#).

Definition at line 221 of file [kip.h](#).

#### 13.1.10.3.6 l4\_kip\_version()

```
l4_umword_t l4_kip_version (
    l4_kernel_info_t const * kip ) [inline]
```

Get the kernel version.

Parameters

<i>kip</i>	Kernel Info Page.
------------	-------------------

Returns

Kernel version string. 0 if KIP could not be mapped.

Definition at line 199 of file [kip.h](#).

References [l4\\_kernel\\_info\\_t::version](#).

#### 13.1.10.3.7 l4\_kip\_version\_string()

```
const char * l4_kip_version_string (
    l4_kernel_info_t const * kip ) [inline]
```

Get the kernel version string.

Parameters

<i>kip</i>	Kernel Info Page.
------------	-------------------

Returns

Kernel version string.

Definition at line 203 of file [kip.h](#).

References [l4\\_kernel\\_info\\_version\\_offset\(\)](#).

Referenced by [l4\\_kip\\_kernel\\_has\\_feature\(\)](#).

*Get end address of the region described by the memory descriptor.*
- `l4_umword_t l4_kernel_info_get_mem_desc_type (l4_kernel_info_mem_desc_t *md) L4_NOTHROW`  
*Get type of the memory region.*
- `l4_umword_t l4_kernel_info_get_mem_desc_subtype (l4_kernel_info_mem_desc_t *md) L4_NOTHROW`  
*Get sub-type of memory region.*
- `l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (l4_kernel_info_mem_desc_t *md) L4_NOTHROW`  
*Get virtual flag of the memory descriptor.*

### 13.1.10.5.1 Detailed Description

C Interface for KIP memory descriptors.

#### Include File

```
#include <l4/sys/memdesc.h>
```

This module contains the C functions to access the memory descriptor in the kernel interface page (KIP).

### 13.1.10.5.2 Typedef Documentation

#### 13.1.10.5.2.1 l4\_kernel\_info\_mem\_desc\_t

```
typedef struct l4_kernel_info_mem_desc_t l4_kernel_info_mem_desc_t
```

Memory descriptor data structure.

#### Note

This data type is opaque, and must be accessed by the accessor functions defined in this module.

### 13.1.10.5.3 Enumeration Type Documentation

#### 13.1.10.5.3.1 I4\_mem\_archspecific\_sub\_type\_common\_t

```
enum I4_mem_archspecific_sub_type_common_t
```

Memory sub types for I4\_mem\_type\_archspecific descriptors.

Enumerator

I4_mem_archspecific_acpi_tables	Firmware ACPI tables.
I4_mem_archspecific_acpi_nvs	Firmware reserved address space.

Definition at line 70 of file [memdesc.h](#).

#### 13.1.10.5.3.2 I4\_mem\_info\_sub\_type\_t

```
enum I4_mem_info_sub_type_t
```

Memory sub types for I4\_mem\_type\_info descriptors.

Enumerator

I4_mem_info_acpi_rsdp	Physical address of the ACPI root pointer.
-----------------------	--

Definition at line 61 of file [memdesc.h](#).

#### 13.1.10.5.3.3 I4\_mem\_type\_t

```
enum I4_mem_type_t
```

Type of a memory descriptor.

Enumerator

I4_mem_type_undefined	Undefined, unused descriptor.
I4_mem_type_conventional	Conventional memory.
I4_mem_type_reserved	Reserved memory for kernel etc.
I4_mem_type_dedicated	Dedicated memory (some device memory)
I4_mem_type_shared	Shared memory (not implemented)
I4_mem_type_info	Info from the boot loader.
I4_mem_type_bootloader	Memory owned by the boot loader.
I4_mem_type_archspecific	Architecture specific memory (e.g., ACPI memory)

Definition at line 44 of file [memdesc.h](#).

### 13.1.10.5.4 Function Documentation

#### 13.1.10.5.4.1 `l4_kernel_info_get_mem_desc_end()`

```
l4_umword_t l4_kernel_info_get_mem_desc_end (
    l4_kernel_info_mem_desc_t * md ) [inline]
```

Get end address of the region described by the memory descriptor.

##### Returns

End address.

Definition at line 227 of file [memdesc.h](#).

#### 13.1.10.5.4.2 `l4_kernel_info_get_mem_desc_is_virtual()`

```
l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (
    l4_kernel_info_mem_desc_t * md ) [inline]
```

Get virtual flag of the memory descriptor.

##### Returns

1 if region is virtual memory, 0 if region is physical memory

Definition at line 248 of file [memdesc.h](#).

#### 13.1.10.5.4.3 `l4_kernel_info_get_mem_desc_start()`

```
l4_umword_t l4_kernel_info_get_mem_desc_start (
    l4_kernel_info_mem_desc_t * md ) [inline]
```

Get start address of the region described by the memory descriptor.

##### Returns

Start address.

Definition at line 220 of file [memdesc.h](#).

#### 13.1.10.5.4.4 `l4_kernel_info_get_mem_desc_subtype()`

```
l4_umword_t l4_kernel_info_get_mem_desc_subtype (
    l4_kernel_info_mem_desc_t * md ) [inline]
```

Get sub-type of memory region.

##### Returns

Sub-type.

The sub type is defined for architecture specific memory descriptors (see [l4\\_mem\\_type\\_archspecific](#)) and has architecture specific meaning.

Definition at line 241 of file [memdesc.h](#).

#### 13.1.10.5.4.5 l4\_kernel\_info\_get\_mem\_desc\_type()

```
l4_umword_t l4_kernel_info_get_mem_desc_type (
    l4_kernel_info_mem_desc_t * md ) [inline]
```

Get type of the memory region.

##### Returns

Type of the region (see [l4\\_mem\\_type\\_t](#)).

Definition at line 234 of file [memdesc.h](#).

#### 13.1.10.5.4.6 l4\_kernel\_info\_get\_num\_mem\_descs()

```
unsigned l4_kernel_info_get_num_mem_descs (
    l4_kernel_info_t * kip ) [inline]
```

Get number of memory descriptors in KIP.

##### Returns

Number of memory descriptors.

Definition at line 198 of file [memdesc.h](#).

#### 13.1.10.5.4.7 l4\_kernel\_info\_set\_mem\_desc()

```
void l4_kernel_info_set_mem_desc (
    l4_kernel_info_mem_desc_t * md,
    l4_addr_t start,
    l4_addr_t end,
    unsigned type,
    unsigned virt,
    unsigned sub_type ) [inline]
```

Populate a memory descriptor.

##### Parameters

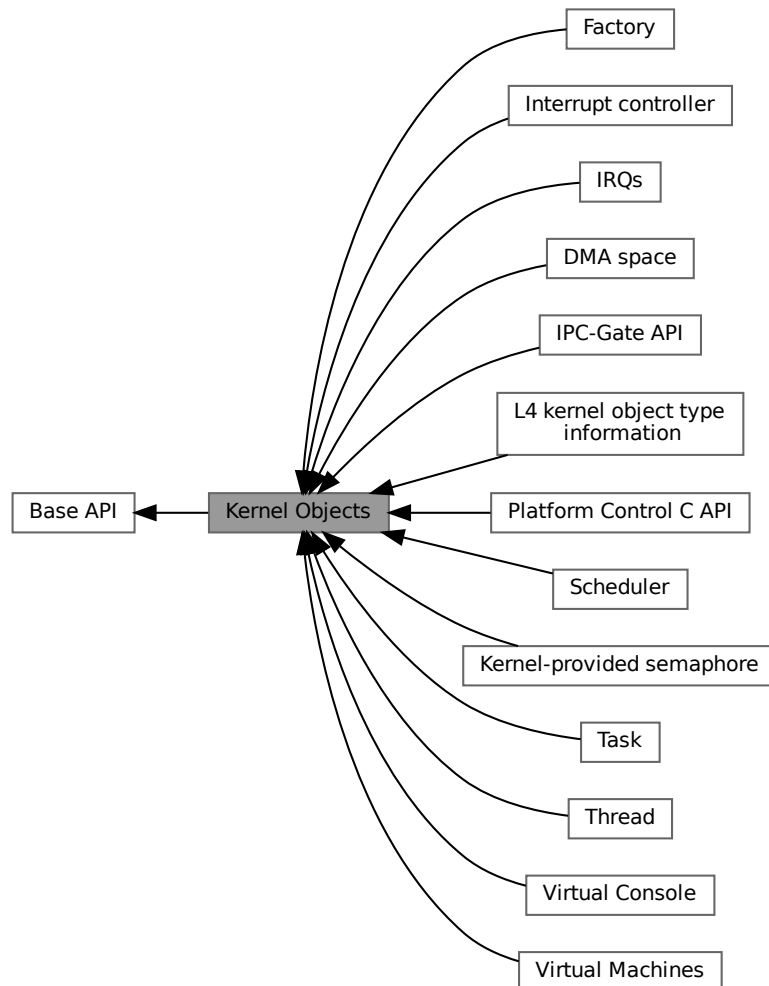

<i>md</i>	Pointer to memory descriptor
<i>start</i>	Start of region
<i>end</i>	End of region
<i>type</i>	Type of region
<i>virt</i>	1 if virtual region, 0 if physical region
<i>sub_type</i>	Sub type.

Definition at line 205 of file [memdesc.h](#).

### 13.1.11 Kernel Objects

API of kernel objects.

Collaboration diagram for Kernel Objects:

#### Modules

- [DMA space](#)

A DMA space represents a device memory address space managed by an IOMMU.

- [Factory](#)

C factory interface to create objects, see [L4::Factory](#) for the C++ interface.

- [IPC-Gate API](#)

The C IPC gate interface, see [L4::lpc\\_gate](#) for the C++ interface.

- [IRQs](#)

C IRQ interface, see [L4::irq](#) for the C++ interface.

- [Interrupt controller](#)

- The C Icu interface, see [L4::Icu](#) for the C++ interface.
- [Kernel-provided semaphore](#)

C semaphore interface, see [L4::Semaphore](#) for the C++ interface.
- [L4 kernel object type information](#)

Type information for [L4](#) server objects that can be called via IPC.
- [Platform Control C API](#)

C interface for controlling platform-wide properties, see [L4::Platform\\_control](#) for the C++ interface.
- [Scheduler](#)

C interface of the Scheduler kernel object, see [L4::Scheduler](#) for the C++ interface.
- [Task](#)

C interface of the Task kernel object, see [L4::Task](#) for the C++ interface.
- [Thread](#)

C Thread object interface, see [L4::Thread](#) for the C++ interface.
- [Virtual Console](#)

C Virtual console interface for simple character based input and output, see [L4::Vcon](#) for the C++ interface.
- [Virtual Machines](#)

Virtual Machine API.

## Data Structures

- class [L4::Kobject](#)

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.
- class [L4::Vm](#)

Virtual machine host address space.

### 13.1.11.1 Detailed Description

API of kernel objects.

#### Include File

```
#include <l4/sys/kernel_object.h>
```

### 13.1.11.2 DMA space

A DMA space represents a device memory address space managed by an IOMMU.

Collaboration diagram for DMA space:

A DMA space represents a device memory address space managed by an IOMMU.

That is, it manages the translation of virtual addresses used by devices to physical addresses. It is accessed via the [L4::Task](#) interface, but with the following caveats:

- No threads can be bound to it.
- No objects (and IO ports on IA32) can be mapped to it.
- No kernel-user memory can be added to it.
- It must be constructed by passing the `L4_PROTO_DMA_SPACE` protocol constant to the kernel factory's `L4::Factory.create()` call.

A DMA space must be bound to an `L4::iommu` to enable the address translation for specific devices.

The kernel factory allows to create DMA spaces only if the kernel has been configured with IOMMU support and if an IOMMU was detected.

### 13.1.11.3 Factory

C factory interface to create objects, see `L4::Factory` for the C++ interface.

Collaboration diagram for Factory:

### Functions

- `l4_msgtag_t l4_factory_create_task (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_fpage_t *utcb_area) L4_NOTHROW`  
*Create a new task.*
- `l4_msgtag_t l4_factory_create_thread (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW`  
*Create a new thread.*
- `l4_msgtag_t l4_factory_create_factory (l4_cap_idx_t factory, l4_cap_idx_t target_cap, unsigned long limit) L4_NOTHROW`  
*Create a new factory.*
- `l4_msgtag_t l4_factory_create_gate (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_cap_idx_t thread_cap, l4_umword_t label) L4_NOTHROW`  
*Create a new IPC gate.*
- `l4_msgtag_t l4_factory_create_irq (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW`  
*Create a new IRQ sender.*
- `l4_msgtag_t l4_factory_create_vm (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW`  
*Create a new virtual machine.*
- `l4_msgtag_t l4_factory_create_vcpu_context (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW`  
*Create a new hardware vCPU context.*
- `l4_msgtag_t l4_factory_create (l4_cap_idx_t factory, long obj, l4_cap_idx_t target) L4_NOTHROW`  
*Create a new object.*

### 13.1.11.3.1 Detailed Description

C factory interface to create objects, see [L4::Factory](#) for the C++ interface.

A factory is used to create all kinds of kernel objects:

- [Task](#)
- [Thread](#)
- [Factory](#)
- [IPC-Gate API](#)
- [IRQs](#)
- [Virtual Machines](#)

To create a new kernel object the caller has to specify the factory to use for creation. The caller has to allocate a capability slot where the kernel stores the new object's capability.

The factory is equipped with a limit that limits the amount of kernel memory available for that factory.

#### Note

The limit does not give any guarantee for the amount of available kernel memory.

#### Include File

```
#include <l4/sys/factory.h>
```

For the C++ interface refer to [L4::Factory](#).

### 13.1.11.3.2 Function Documentation

#### 13.1.11.3.2.1 l4\_factory\_create()

```
l4_msgtag_t l4_factory_create (
    l4_cap_idx_t factory,
    long obj,
    l4_cap_idx_t target ) [inline]
```

Create a new object.

#### Parameters

	<i>factory</i>	Factory to use for creation.
	<i>obj</i>	Protocol ID to describe the type of the object to create.
out	<i>target</i>	The kernel stores the new objects's capability into this slot.

## Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on <code>factory</code> and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

Definition at line 648 of file [factory.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.3.2.2 l4\_factory\_create\_factory()

```

l4_msgtag_t l4_factory_create_factory (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    unsigned long limit ) [inline]
  
```

Create a new factory.

## Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new factory's capability into this slot.
	<i>limit</i>	Limit for the new factory in bytes.

## Returns

Syscall return tag

## Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on <code>factory</code> and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

**Note**

The limit of the new factory is subtracted from the available amount of the factory used for creation.

This method is only guaranteed to work with the [Kernel Factory](#). For other services, use the generic [L4::Factory::create\(\)](#) method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line 495 of file [factory.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.3.2.3 l4\_factory\_create\_gate()**

```

l4_msgtag_t l4_factory_create_gate (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    l4_cap_idx_t thread_cap,
    l4_umword_t label ) [inline]
  
```

Create a new IPC gate.

**Parameters**

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new IPC gate's capability into this slot.
	<i>thread_cap</i>	Optional capability selector of a thread to bind the gate to. Use <a href="#">L4_INVALID_CAP</a> to create an unbound IPC gate.
	<i>label</i>	Optional label of the gate (precisely used if <i>thread_cap</i> is valid). If <i>thread_cap</i> is valid, <i>label</i> must be present.

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<i>L4_EOK</i>	No error occurred.
<i>-L4_ENOMEM</i>	Out-of-memory during allocation of the <i>lpc_gate</i> object.
<i>-L4_EINVAL</i>	<i>thread_cap</i> is void or points to something that is not a thread.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> rights on <i>factory</i> or <i>thread_cap</i> .

An unbound IPC gate can be bound to a thread using [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#).

#### 13.1.11.3.2.4 l4\_factory\_create\_irq()

```

l4_msgtag_t l4_factory_create_irq (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap ) [inline]
  
```

Create a new IRQ sender.

Parameters

	<i>factory</i>	Factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new IRQ's capability into this slot.

Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on <i>factory</i> and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

#### 13.1.11.3.2.5 l4\_factory\_create\_task()

```

l4_msgtag_t l4_factory_create_task (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    l4_fpage_t * utcb_area ) [inline]
  
```

Create a new task.

##### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new task's capability into this slot.
in, out	<i>utcb_area</i>	Pointer to flexpage that describes an area of kernel-user memory that can be used for UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

##### Returns

Syscall return tag.

##### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on <i>factory</i> and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

##### Note

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to [l4\\_task\\_add\\_ku\\_mem\(\)](#) for adding more of this type of memory.

#### 13.1.11.3.2.6 l4\_factory\_create\_thread()

```

l4_msgtag_t l4_factory_create_thread (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap ) [inline]
  
```

Create a new thread.

Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new thread's capability into this slot.

Returns

Syscall return tag

Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on <i>factory</i> and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

#### 13.1.11.4 IPC-Gate API

The C IPC gate interface, see [L4::lpc\\_gate](#) for the C++ interface.

Collaboration diagram for IPC-Gate API:

#### Functions

- [l4\\_msgtag\\_t l4\\_ipc\\_gate\\_get\\_infos](#) ([l4\\_cap\\_idx\\_t](#) gate, [l4\\_umword\\_t](#) \*label)  
*Get information about the IPC-gate.*
- [l4\\_msgtag\\_t l4\\_rcv\\_ep\\_bind\\_thread](#) ([l4\\_cap\\_idx\\_t](#) ep, [l4\\_cap\\_idx\\_t](#) thread, [l4\\_umword\\_t](#) label)  
*Bind the IPC receive endpoint to a thread.*

##### 13.1.11.4.1 Detailed Description

The C IPC gate interface, see [L4::lpc\\_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) that is *bound* to the IPC gate (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When no thread is bound yet, the forwarded IPC blocks until a thread is bound or the IPC times out.

Forwarded IPC is always forwarded to the userland of the bound thread. That means, the [Thread](#) interface of the bound thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the bound

thread instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding a thread to an IPC gate, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are the result of bitwise disjunction of the corresponding label bits with the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. Hence, the label provided via [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) should usually have its two least significant bits set to zero. The replaced label is only visible to the bound thread upon receive. However, the configured label of an IPC gate can also be queried via [l4\\_ipc\\_gate\\_get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4\\_thread\\_modify\\_sender\\_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread for the first time.

When binding a new thread to an IPC gate that is currently bound, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

#### Include File

```
#include <l4/sys/ipc_gate.h>
```

For the C++ interface refer to the [L4::ipc\\_gate](#) documentation.

#### See also

[Object Invocation](#)

### 13.1.11.4.2 Function Documentation

#### 13.1.11.4.2.1 l4\_ipc\_gate\_get\_infos()

```
l4_msgtag_t l4_ipc_gate_get_infos (
    l4_cap_idx_t gate,
    l4_umword_t * label ) [inline]
```

Get information about the IPC-gate.

#### Parameters

	<i>gate</i>	The IPC gate object to get information about.
out	<i>label</i>	The label of the IPC gate is returned here.

#### Returns

System call return tag.

**Precondition**

If `gate` does not possess the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread is bound yet.

Definition at line 159 of file [ipc\\_gate.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.4.2.2 l4\_rcv\_ep\_bind\_thread()**

```

l4_msgtag_t l4_rcv_ep_bind_thread (
    l4_cap_idx_t ep,
    l4_cap_idx_t thread,
    l4_umword_t label ) [inline]
  
```

Bind the IPC receive endpoint to a thread.

**Parameters**

<i>ep</i>	The IPC receive endpoint object.
<i>thread</i>	The thread object that shall be bound to <i>ep</i> .
<i>label</i>	Label to assign to <i>ep</i> . The two least significant bits should usually be set to zero.

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	<i>thread</i> is not a thread object or other arguments were malformed.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> right on <i>ep</i> or <i>thread</i> .

**Precondition**

If `ep` is an IPC gate capability without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread is bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless [l4\\_thread\\_modify\\_sender\\_start\(\)](#) is used to change these labels.

**Examples**

[examples/sys/isr/main.c](#).

Definition at line 91 of file [rcv\\_endpoint.h](#).

*Unmask this IRQ.*

### 13.1.11.5.1 Detailed Description

C IRQ interface, see [L4::Irq](#) for the C++ interface.

The IRQ interface provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via [l4\\_irq\\_trigger\(\)](#).

For hardware and virtual device interrupts the `Irq` object must be bound to an interrupt source, see [Interrupt controller](#). To receive interrupts, the `Irq` object must be bound to a thread, see [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#).

IRQ objects can be created using a factory, see the [Factory](#) API (use [l4\\_factory\\_create\\_irq\(\)](#)).

#### Include File

```
#include <l4/sys/irq.h>
```

For the C++ interface refer to the [L4::Irq](#) API for an overview.

### 13.1.11.5.2 Enumeration Type Documentation

#### 13.1.11.5.2.1 L4\_irq\_mode

```
enum L4_irq_mode
```

Interrupt attributes.

## Enumerator

L4_IRQ_F_NONE	Flow types. None
L4_IRQ_F_LEVEL	Level triggered.
L4_IRQ_F_EDGE	Edge triggered.
L4_IRQ_F_POS	Positive trigger.
L4_IRQ_F_NEG	Negative trigger.
L4_IRQ_F_BOTH	Both edges trigger.
L4_IRQ_F_LEVEL_HIGH	Level high trigger.
L4_IRQ_F_LEVEL_LOW	Level low trigger.
L4_IRQ_F_POS_EDGE	Positive edge trigger.
L4_IRQ_F_NEG_EDGE	Negative edge trigger.
L4_IRQ_F_BOTH_EDGE	Both edges trigger.
L4_IRQ_F_MASK	Mask.
L4_IRQ_F_SET_WAKEUP	Wakeup source? Use irq as wakeup source
L4_IRQ_F_CLEAR_WAKEUP	Do not use irq as wakeup source.

Definition at line 80 of file [icu.h](#).

## 13.1.11.5.3 Function Documentation

## 13.1.11.5.3.1 l4\_irq\_detach()

```
l4_msgtag_t l4_irq_detach (
    l4_cap_idx_t irq ) [inline]
```

Detach from an interrupt source.

## Parameters

<i>irq</i>	The IRQ object that shall be detached.
------------	--

## Returns

Syscall return tag

## Return values

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
-L4_EPERM	No <a href="#">L4_CAP_FPAGE_S</a> rights on the capability used to invoke this operation.

## Examples

[examples/sys/isr/main.c](#).

Definition at line 299 of file [irq.h](#).

References [l4\\_irq\\_detach\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.5.3.2 l4\_irq\_detach\_u()

```

l4_msgtag_t l4_irq_detach_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb ) [inline]
  
```

Detach from this interrupt.

#### Parameters

<i>irq</i>	The IRQ object that shall be detached.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Return values

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
-L4_EPERM	No <a href="#">L4_CAP_FPAGE_S</a> rights on the capability used to invoke this operation.

Definition at line 254 of file [irq.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ\\_SENDER](#), and [l4\\_msg\\_regs\\_t::mr](#).

Referenced by [L4::Irq::detach\(\)](#), and [l4\\_irq\\_detach\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.3 l4\_irq\_mux\_chain()

```

l4_msgtag_t l4_irq_mux_chain (
    l4_cap_idx_t irq,
    l4_cap_idx_t slave ) [inline]
  
```

Chain an IRQ to another master IRQ source.

**Deprecated** IRQ muxer objects are no longer supported by the kernel.

##### Parameters

<i>irq</i>	The master IRQ object.
<i>slave</i>	The slave that shall be attached to the master.

##### Returns

Syscall return tag

The chaining feature of IRQ objects allows to deal with shared IRQs. For chaining IRQs there must be a master IRQ object, bound to the real IRQ source. Note, the master IRQ must not have a thread bound to it.

This function allows to add a limited number of slave IRQs to this master IRQ, with the semantics that each of the slave IRQs is triggered whenever the master IRQ is triggered. The master IRQ will be masked automatically when an IRQ is delivered and shall be unmasked when all attached slave IRQs are unmasked.

Definition at line 293 of file [irq.h](#).

References [l4\\_irq\\_mux\\_chain\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.5.3.4 l4\_irq\_mux\_chain\_u()

```

l4_msgtag_t l4_irq_mux_chain_u (
    l4_cap_idx_t irq,
    l4_cap_idx_t slave,
    l4_utcb_t * utcb ) [inline]
  
```

Attach an IRQ to this multiplexer.

##### Parameters

<i>irq</i>	The master IRQ object.
<i>slave</i>	The slave that shall be attached to the master.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

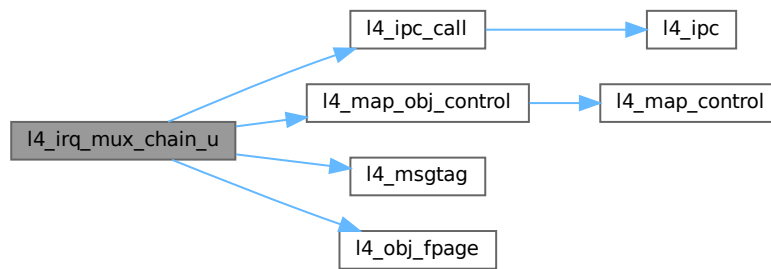

The chaining feature of IRQ objects allows to deal with shared IRQs. For chaining IRQs there must be an IRQ multiplexer ([l4\\_irq\\_mux](#)) bound to the real IRQ source. This function allows to add slave IRQs to this multiplexer.

Definition at line 242 of file [irq.h](#).

References [L4\\_CAP\\_FPAGE\\_RWS](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_map\\_obj\\_control\(\)](#), [l4\\_msgtag\(\)](#), [l4\\_obj\\_fpage\(\)](#), [L4\\_PROTO\\_IRQ\\_MUX](#), [l4\\_msg\\_regs\\_t::mr](#), and [l4\\_fpage\\_t::raw](#).

Referenced by [L4::l4\\_irq\\_mux::chain\(\)](#), and [l4\\_irq\\_mux\\_chain\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.5 l4\_irq\_receive()

```

l4_msgtag_t l4_irq_receive (
    l4_cap_idx_t irq,
    l4_timeout_t to ) [inline]
  
```

Unmask and wait for specified IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>to</i>	Timeout.

##### Returns

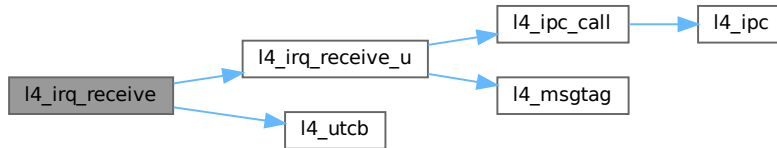

Syscall return tag

Definition at line 311 of file `irq.h`.

References `l4_irq_receive_u()`, and `l4_utcb()`.

Referenced by [L4Re::Util::Event\\_buffer\\_consumer\\_t< PAYLOAD >::process\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.6 l4\_irq\_receive\_u()

```

l4_msgtag_t l4_irq_receive_u (
    l4_cap_idx_t irq,
    l4_timeout_t timeout,
    l4_utcb_t * utcb ) [inline]
  
```

Unmask and wait for this IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

##### Note

If this is the function normally used for your IRQs consider using [L4::Semaphore](#) instead of [L4::Irq](#).

Definition at line 269 of file [irq.h](#).

References [l4\\_ipc\\_call\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ](#), and [l4\\_msg\\_regs\\_t::mr](#).

Referenced by [l4\\_irq\\_receive\(\)](#), and [L4::Irq::receive\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.7 l4\_irq\_trigger()

```
l4_msgtag_t l4_irq_trigger (
    l4_cap_idx_t irq ) [inline]
```

Trigger an IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be triggered.
------------	---

##### Returns

Syscall return tag.

Note that this function is a send only operation, i.e. there is no return value except for a failed send operation. Especially [l4\\_error\(\)](#) will return an error value from the message tag which still contains the IRQ protocol used for the send operation.

Use [l4\\_ipc\\_error\(\)](#) to check for (send) errors.

Definition at line 305 of file [irq.h](#).

References [l4\\_irq\\_trigger\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Referenced by [l4\\_semaphore\\_up\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.8 l4\_irq\_trigger\_u()

```

l4_msgtag_t l4_irq_trigger_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb ) [inline]
  
```

Trigger the object.

##### Parameters

<i>irq</i>	The IRQ object that shall be triggered.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 262 of file [irq.h](#).

References [L4\\_IPC\\_BOTH\\_TIMEOUT\\_0](#), [l4\\_ipc\\_send\(\)](#), [l4\\_msgtag\(\)](#), and [L4\\_PROTO\\_IRQ](#).

Referenced by [l4\\_irq\\_trigger\(\)](#), and [L4::Triggerable::trigger\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.5.3.9 l4\_irq\_unmask()

```
l4_msgtag_t l4_irq_unmask (
    l4_cap_idx_t irq ) [inline]
```

Unmask IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
------------	--

##### Returns

Syscall return tag

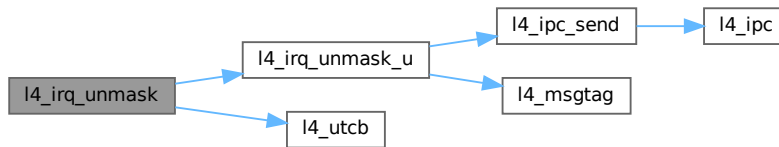

##### Note

[l4\\_irq\\_wait\(\)](#) and [l4\\_irq\\_receive\(\)](#) are doing the unmask themselves.

Definition at line 324 of file [irq.h](#).

References [l4\\_irq\\_unmask\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.5.3.10 l4\_irq\_unmask\_u()

```

l4_msgtag_t l4_irq_unmask_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb ) [inline]
  
```

Unmask this IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

[Irq::wait\(\)](#) and [Irq::receive\(\)](#) operations already include an [unmask\(\)](#), do not use an extra [unmask\(\)](#) in these cases.

Definition at line 285 of file [irq.h](#).

References [L4\\_IPC\\_NEVER](#), [l4\\_ipc\\_send\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ](#), and [l4\\_msg\\_regs\\_t::mr](#).

Referenced by [l4\\_irq\\_unmask\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.11.5.3.11 l4\_irq\_wait()

```

l4_msgtag_t l4_irq_wait (
    l4_cap_idx_t irq,
    l4_umword_t * label,
    l4_timeout_t to ) [inline]
  
```

Unmask IRQ and wait for any message.

#### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>label</i>	Receive label.
<i>to</i>	Timeout.

#### Returns

Syscall return tag

#### Examples

[examples/sys/isr/main.c](#).

Definition at line 317 of file [irq.h](#).

References [l4\\_irq\\_wait\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## 13.1.11.5.3.12 l4\_irq\_wait\_u()

```
l4_msgtag_t l4_irq_wait_u (
    l4_cap_idx_t irq,
    l4_umword_t * label,
    l4_timeout_t timeout,
    l4_utcb_t * utcb ) [inline]
```

Unmask IRQ and (open) wait for any message.

## Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>label</i>	The <i>protected label</i> shall be received here.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag

Definition at line 276 of file [irq.h](#).

References [l4\\_ipc\\_send\\_and\\_wait\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ](#), and [l4\\_msg\\_regs\\_t::mr](#).

*Mask an IRQ line.*

### 13.1.11.6.1 Detailed Description

The C lcu interface, see [L4::lcu](#) for the C++ interface.

#### Note

"ICU" is short for "interrupt control unit".

These functions define the interface for interrupt controllers, for binding IRQ objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.

To setup an IRQ line the following steps are required:

1. [l4\\_icu\\_set\\_mode\(\)](#) (optional if IRQ has a default mode)
2. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) to attach the IRQ object to a thread
3. [l4\\_icu\\_bind\(\)](#)
4. [l4\\_icu\\_unmask\(\)](#) to receive the first IRQ

For certain interrupt sources only some of these steps are necessary and supported, see [Scheduler](#) and [Virtual Console](#).

At most one [IRQs](#) object can be bound to a certain interrupt source and a certain [IRQs](#) object can be bound to at most one interrupt source.

#### Include File

```
#include <l4/sys/icu.h>
```

### 13.1.11.6.2 Typedef Documentation

#### 13.1.11.6.2.1 l4\_icu\_info\_t

```
typedef struct l4_icu_info_t l4_icu_info_t
```

Info structure for an ICU.

This structure contains information about the features of an ICU.

See also

[l4\\_icu\\_info\(\)](#).

### 13.1.11.6.3 Enumeration Type Documentation

#### 13.1.11.6.3.1 L4\_icu\_flags

```
enum L4_icu_flags
```

Flags for IRQ numbers used for the ICU.

Enumerator

L4_ICU_FLAG_MSI	Flag to denote that the IRQ is actually an MSI. This flag may be used for <a href="#">l4_icu_bind()</a> and <a href="#">l4_icu_unbind()</a> functions to denote that the IRQ number is meant to be an MSI.
-----------------	--

Definition at line 63 of file [icu.h](#).

### 13.1.11.6.4 Function Documentation

#### 13.1.11.6.4.1 l4\_icu\_bind()

```
l4_msgtag_t l4_icu_bind (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_cap_idx_t irq ) [inline]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

Parameters

<i>icu</i>	ICU object to bind <i>irq</i> to.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to bind to this ICU.

## Returns

Syscall return tag. The caller should check the return value using [l4\\_error\(\)](#) to check for errors and to identify the correct method for unmasking the interrupt. Return values  $< 0$  indicate an error. A return value of 0 means a direct unmask via the IRQ object using [l4\\_irq\\_unmask\(\)](#). A return value of 1 means that the interrupt has to be unmasked via the ICU using [l4\\_icu\\_unmask\(\)](#).

## Return values

-L4_EINVAL	<code>irq</code> is bound to an interrupt source.
-L4_EPERM	The ICU instance requires <a href="#">L4_CAP_FPAGE_W</a> on <code>irq</code> and <a href="#">L4_CAP_FPAGE_W</a> was not present.

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different IRQ object, only the unbinding happens. An IRQ object that is bound to an interrupt source will get unbound if the IRQ object is deleted.

## Examples

[examples/sys/isr/main.c](#).

Definition at line 504 of file [icu.h](#).

References [l4\\_icu\\_bind\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## 13.1.11.6.4.2 l4\_icu\_bind\_u()

```

l4_msgtag_t l4_icu_bind_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_cap_idx_t irq,
    l4_utcb_t * utcb ) [inline]
  
```

Bind an interrupt line of an interrupt controller to an interrupt object.

## Parameters

<i>icu</i>	The ICU object to bind <code>irq</code> to.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object for the given IRQ line to bind to this ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### 13.1.11.6.4.3 l4\_icu\_info()

```
l4_msgtag_t l4_icu_info (
    l4_cap_idx_t icu,
    l4_icu_info_t * info ) [inline]
```

Get information about the ICU features.

##### Parameters

	<i>icu</i>	The ICU object from which information shall be retrieved.
out	<i>info</i>	Info structure to be filled with information.

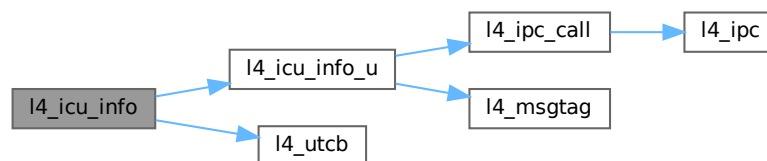

##### Returns

Syscall return tag

Definition at line 512 of file [icu.h](#).

References [l4\\_icu\\_info\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.6.4.4 l4\_icu\_info\_u()

```
l4_msgtag_t l4_icu_info_u (
    l4_cap_idx_t icu,
    l4_icu_info_t * info,
    l4_utcb_t * utcb ) [inline]
```

Get information about the ICU features.

##### Parameters

	<i>icu</i>	The ICU object from which MSI information shall be retrieved.
out	<i>info</i>	Info structure to be filled with information.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag

Definition at line 428 of file [icu.h](#).

References [L4\\_ICU\\_OP\\_INFO](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ](#), and [l4\\_msg\\_regs\\_t::mr](#).

Referenced by [L4::l4u::info\(\)](#), and [l4\\_icu\\_info\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.6.4.5 l4\_icu\_mask()

```

l4_msgtag_t l4_icu_mask (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to ) [inline]
  
```

Mask an IRQ line.

## Parameters

<i>icu</i>	The ICU object where the IRQ line shall be masked.
<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
<i>to</i>	IPC timeout, if unsure use L4_IPC_NEVER.

## Returns

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line [526](#) of file [icu.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## 13.1.11.6.4.6 l4\_icu\_mask\_u()

```

l4_msgtag_t l4_icu_mask_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to,
    l4_utcb_t * utcb ) [inline]
  
```

Mask an IRQ line.

## Parameters

<i>icu</i>	The ICU object where the IRQ line shall be masked.
<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 491 of file `icu.h`.

Referenced by `L4::Icu::mask()`.

Here is the caller graph for this function:

## 13.1.11.6.4.7 l4\_icu\_msi\_info()

```

l4_msgtag_t l4_icu_msi_info (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info ) [inline]
  
```

Get MSI info about IRQ.

## Parameters

	<i>icu</i>	The ICU object from which MSI information shall be retrieved.
	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <code>l4_icu_msi_info_t</code> structure receiving the address and the data value to trigger this MSI.

## Returns

Syscall return tag

Definition at line 516 of file `icu.h`.

References `l4_icu_msi_info_u()`, and `l4_utcb()`.

Here is the call graph for this function:

#### 13.1.11.6.4.8 l4\_icu\_msi\_info\_u()

```

l4_msgtag_t l4_icu_msi_info_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info,
    l4_utcb_t * utcb ) [inline]
  
```

Get MSI info about IRQ.

##### Parameters

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>icu</i>	The ICU object from which MSI information shall be retrieved.
	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <a href="#">l4_icu_msi_info_t</a> structure receiving the address and the data value to trigger this MSI.

##### Returns

Syscall return tag

Definition at line 442 of file [icu.h](#).

References [L4\\_ICU\\_OP\\_MSI\\_INFO](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [l4\\_msgtag\\_has\\_error\(\)](#), [l4\\_msgtag\\_words\(\)](#), [L4\\_PROTO\\_IRQ](#), [L4\\_UNLIKELY](#), [l4\\_utcb\\_mr64\\_idx\(\)](#), [l4\\_msg\\_regs\\_t::mr](#), and [l4\\_msg\\_regs\\_t::mr64](#).

Here is the caller graph for this function:

#### 13.1.11.6.4.9 l4\_icu\_set\_mode()

```

l4_msgtag_t l4_icu_set_mode (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t mode ) [inline]
  
```

Set interrupt mode.

##### Parameters

<i>icu</i>	The ICU object.
<i>irqnum</i>	IRQ line at the ICU.
<i>mode</i>	Mode, see <a href="#">L4_irq_mode</a> .

##### Returns

Syscall return tag

Definition at line 531 of file [icu.h](#).

References [l4\\_icu\\_set\\_mode\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.6.4.10 l4\_icu\_set\_mode\_u()

```

l4_msgtag_t l4_icu_set_mode_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t mode,
    l4_utcb_t * utcb ) [inline]
  
```

Set interrupt mode.

##### Parameters

<i>icu</i>	The ICU object.
<i>irqnum</i>	IRQ line at the ICU.
<i>mode</i>	Mode, see <a href="#">L4_irq_mode</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

Definition at line 465 of file [icu.h](#).

References [L4\\_ICU\\_OP\\_SET\\_MODE](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_IRQ](#), and [l4\\_msg\\_regs\\_t::mr](#).

#### 13.1.11.6.4.11 l4\_icu\_unbind()

```

l4_msgtag_t l4_icu_unbind (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_cap_idx_t irq ) [inline]
  
```

Remove binding of an interrupt line from the interrupt controller object.

##### Parameters

<i>icu</i>	The ICU object from where the binding shall be removed.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to remove from the ICU.

##### Returns

Syscall return tag

Definition at line 508 of file `icu.h`.

References `l4_icu_unbind_u()`, and `l4_utcb()`.

Here is the call graph for this function:

#### 13.1.11.6.4.12 l4\_icu\_unbind\_u()

```

l4_msgtag_t l4_icu_unbind_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_cap_idx_t irq,
    l4_utcb_t * utcb ) [inline]
  
```

Remove binding of an interrupt line from the interrupt controller object.

##### Parameters

<i>icu</i>	The ICU object from where the binding shall be removed.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to remove from the ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

Definition at line 416 of file [icu.h](#).

References [L4\\_CAP\\_FPAGE\\_RWS](#), [L4\\_ICU\\_OP\\_UNBIND](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_map\\_obj\\_control\(\)](#), [l4\\_msgtag\(\)](#), [l4\\_obj\\_fpage\(\)](#), [L4\\_PROTO\\_IRQ](#), [l4\\_msg\\_regs\\_t::mr](#), and [l4\\_fpage\\_t::raw](#).

Here is the caller graph for this function:

#### 13.1.11.6.4.13 l4\_icu\_unmask()

```

l4_msgtag_t l4_icu_unmask (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to ) [inline]
  
```

Unmask an IRQ line.

##### Parameters

<i>icu</i>	The ICU object where the IRQ line shall be unmasked.
<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
<i>to</i>	IPC timeout, if unsure use <code>L4_IPC_NEVER</code> .

## Returns

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 521 of file `icu.h`.

References `l4_utcb()`.

Here is the call graph for this function:

## 13.1.11.6.4.14 l4\_icu\_unmask\_u()

```

l4_msgtag_t l4_icu_unmask_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to,
    l4_utcb_t * utcb ) [inline]
  
```

Unmask the given interrupt line.

## Parameters

<i>icu</i>	The ICU object where the IRQ line shall be unmasked.
------------	--

When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.

Its counterpart for explicitly masking an interrupt line is `L4::Icu::mask()`.

## Parameters

	<i>irqnum</i>	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
out	<i>label</i>	If <code>NULL</code> , this is a send-only unmask. If not <code>NULL</code> , this operation enters an open wait and the <i>protected label</i> shall be received here.
	<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non- <code>NULL label</code> only.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <code>l4_utcb</code> .

### Returns

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 496 of file `icu.h`.

### 13.1.11.7 Kernel-provided semaphore

C semaphore interface, see `L4::Semaphore` for the C++ interface.

Collaboration diagram for Kernel-provided semaphore:

### Functions

- `l4_msgtag_t l4_semaphore_up (l4_cap_idx_t sem) L4_NOTHROW`  
*Semaphore up operation (wrapper for trigger()).*
- `l4_msgtag_t l4_semaphore_down (l4_cap_idx_t sem, l4_timeout_t timeout) L4_NOTHROW`  
*Semaphore down operation.*

#### 13.1.11.7.1 Detailed Description

C semaphore interface, see `L4::Semaphore` for the C++ interface.

#### Include File

```
#include <l4/sys/semaphore.h>
```

#### 13.1.11.7.2 Function Documentation

##### 13.1.11.7.2.1 l4\_semaphore\_down()

```
l4_msgtag_t l4_semaphore_down (
    l4_cap_idx_t sem,
    l4_timeout_t timeout ) [inline]
```

Semaphore down operation.

## Parameters

<i>sem</i>	Semaphore object.
<i>timeout</i>	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.

## Returns

Syscall return tag. Use [l4\\_error\(\)](#) to check for errors.

## Return values

<code>-L4_EPERM</code>	No <a href="#">L4_CAP_FPAGE_S</a> right on invoked semaphore capability.
------------------------	--

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an `up()` operation.

Definition at line 110 of file [semaphore.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

13.1.11.7.2.2 `l4_semaphore_up()`

```
l4_msgtag_t l4_semaphore_up (
    l4_cap_idx_t sem ) [inline]
```

Semaphore up operation (wrapper for `trigger()`).

## Parameters

<i>sem</i>	Semaphore object.
------------	-------------------

## Returns

Send-only IPC message return tag. Use [l4\\_ipc\\_error\(\)](#) to check for errors, do **not** use [l4\\_error\(\)](#).

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least  $2^{31}-1$ .

Definition at line 56 of file [semaphore.h](#).

References [l4\\_irq\\_trigger\(\)](#).

Here is the call graph for this function:

### 13.1.11.8 L4 kernel object type information

Type information for [L4](#) server objects that can be called via IPC.

Collaboration diagram for L4 kernel object type information:

## Data Structures

- struct [L4::Type\\_info](#)  
*Dynamic Type Information for [L4Re](#) Interfaces.*
- struct [L4::Kobject\\_typeid< T >](#)  
*Meta object for handling access to type information of Kobjects.*
- class [L4::Kobject\\_t< Derived, Base, PROTO, S\\_DEMAND >](#)  
*Helper class to create an [L4Re](#) interface class that is derived from a single base class.*
- class [L4::Kobject\\_2t< Derived, Base1, Base2, PROTO, S\\_DEMAND >](#)  
*Helper class to create an [L4Re](#) interface class that is derived from two base classes (see [L4::Kobject\\_t](#)).*
- struct [L4::Kobject\\_3t< Derived, Base1, Base2, Base3, PROTO, S\\_DEMAND >](#)  
*Helper class to create an [L4Re](#) interface class that is derived from three base classes (see [L4::Kobject\\_t](#)).*
- struct [L4::Kobject\\_x< Derived, ARGS >](#)  
*Generic [Kobject](#) inheritance template.*

## Functions

- template<typename T >  
[Type\\_info](#) const \* [L4::kobject\\_typeid](#) () noexcept  
*Get the [L4::Type\\_info](#) for the [L4Re](#) interface given in T.*

### 13.1.11.8.1 Detailed Description

Type information for [L4](#) server objects that can be called via IPC.

This type information consists of inheritance information, the protocol number assigned to an interface as well as the demand on server-side resources.

### 13.1.11.8.2 Function Documentation

#### 13.1.11.8.2.1 kobject\_typeid()

```
template<typename T >
Type_info const * L4::kobject_typeid ( ) [inline], [noexcept]
```

Get the [L4::Type\\_info](#) for the [L4Re](#) interface given in T.

#### Template Parameters

<a href="#">T</a>	The type ( <a href="#">L4Re</a> interface) for which the information shall be returned.
-------------------	---

#### Returns

A pointer to the [L4::Type\\_info](#) structure for T.

Definition at line 693 of file [\\_\\_typeinfo.h](#).

References [L4::Kobject\\_typeid< T >::id\(\)](#).

Here is the call graph for this function:

### 13.1.11.9 Platform Control C API

C interface for controlling platform-wide properties, see [L4::Platform\\_control](#) for the C++ interface.

Collaboration diagram for Platform Control C API:

## Functions

- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_set\\_task\\_asid](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_cap\\_idx\\_t](#) task, [l4\\_umword\\_t](#) asid) [L4\\_NOTHROW](#)  
*Set ASID of task.*
- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_system\\_suspend](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_umword\\_t](#) extras) [L4\\_NOTHROW](#)  
*Enter suspend to RAM.*
- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_system\\_shutdown](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_umword\\_t](#) reboot) [L4\\_NOTHROW](#)  
*Shutdown or reboot the system.*
- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_cpu\\_allow\\_shutdown](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_umword\\_t](#) phys\_id, [l4\\_umword\\_t](#) enable) [L4\\_NOTHROW](#)  
*Allow a CPU to be shut down.*
- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_cpu\\_enable](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_umword\\_t](#) phys\_id) [L4\\_NOTHROW](#)  
*Enable an offline CPU.*
- [l4\\_msgtag\\_t l4\\_platform\\_ctl\\_cpu\\_disable](#) ([l4\\_cap\\_idx\\_t](#) pfc, [l4\\_umword\\_t](#) phys\_id) [L4\\_NOTHROW](#)  
*Disable an online CPU.*

### 13.1.11.9.1 Detailed Description

C interface for controlling platform-wide properties, see [L4::Platform\\_control](#) for the C++ interface.

#### Include File

```
#include <l4/sys/platform_control.h>
```

The API allows a client to suspend, reboot or shutdown the system.

For the C++ interface refer to [L4::Platform\\_control](#)

### 13.1.11.9.2 Function Documentation

#### 13.1.11.9.2.1 l4\_platform\_ctl\_cpu\_allow\_shutdown()

```
l4\_msgtag\_t l4_platform_ctl_cpu_allow_shutdown (
    l4\_cap\_idx\_t pfc,
    l4\_umword\_t phys_id,
    l4\_umword\_t enable ) [inline]
```

Allow a CPU to be shut down.

#### Parameters

<i>pfc</i>	Capability selector for the platform-control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.
<i>enable</i>	Allow shutdown when 1, disallow when 0.

**Returns**

Syscall return tag

Definition at line 253 of file [platform\\_control.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.9.2.2 l4\_platform\_ctl\_cpu\_disable()**

```

l4_msgtag_t l4_platform_ctl_cpu_disable (
    l4_cap_idx_t pfc,
    l4_umword_t phys_id ) [inline]
  
```

Disable an online CPU.

**Parameters**

<i>pfc</i>	Capability to the platform control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.

**Returns**

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

Definition at line 292 of file [platform\\_control.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.9.2.3 l4\_platform\_ctl\_cpu\_enable()

```
l4_msgtag_t l4_platform_ctl_cpu_enable (
    l4_cap_idx_t pfc,
    l4_umword_t phys_id ) [inline]
```

Enable an offline CPU.

#### Parameters

<i>pfc</i>	Capability to the platform control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.

#### Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

Definition at line 285 of file [platform\\_control.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.9.2.4 l4\_platform\_ctl\_set\_task\_asid()

```
l4_msgtag_t l4_platform_ctl_set_task_asid (
    l4_cap_idx_t pfc,
    l4_cap_idx_t task,
    l4_umword_t asid ) [inline]
```

Set ASID of task.

On Cortex-R52 platforms, it might be necessary to control the VMID of a task or virtual machine explicitly. The IOMPU on such platforms will use it for further access control of device memory accesses. A privileged component can use this call to control the value.

The caller must have write permissions to the destination task.

## Parameters

<i>pfc</i>	Capability selector for the platform-control object.
<i>task</i>	Capability selector of destination task
<i>asid</i>	New ASID value

## Returns

Syscall return tag

Definition at line 62 of file [\\_\\_platform\\_control-arm.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.9.2.5 l4\_platform\_ctl\_system\_shutdown()

```
l4_msgtag_t l4_platform_ctl_system_shutdown (
    l4_cap_idx_t pfc,
    l4_umword_t reboot ) [inline]
```

Shutdown or reboot the system.

## Parameters

<i>pfc</i>	Capability selector for the platform-control object.
<i>reboot</i>	Shutdown when 0, or reboot when 1.

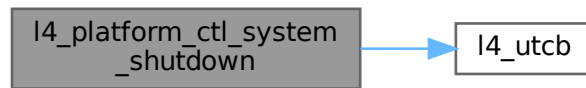

## Returns

Syscall return tag

Definition at line 232 of file [platform\\_control.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.9.2.6 l4\_platform\_ctl\_system\_suspend()

```

l4_msgtag_t l4_platform_ctl_system_suspend (
    l4_cap_idx_t pfc,
    l4_umword_t extras ) [inline]
  
```

Enter suspend to RAM.

##### Precondition

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

##### Parameters

<i>pfc</i>	Capability selector for the platform-control object.
<i>extras</i>	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the Platform_control object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as Io's Platform_control object don't make use of this value at the moment.

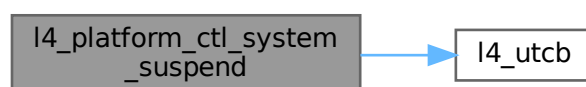

##### Returns

Syscall return tag

Definition at line 225 of file [platform\\_control.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.10 Scheduler

C interface of the Scheduler kernel object, see [L4::Scheduler](#) for the C++ interface.

Collaboration diagram for Scheduler:

*Query if a CPU is online.*

### 13.1.11.10.1 Detailed Description

C interface of the Scheduler kernel object, see [L4::Scheduler](#) for the C++ interface.

The Scheduler interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.

The scheduler offers a virtual device IRQ which triggers when the number of online cores changes, e.g. due to hotplug events. In contrast to hardware IRQs, this IRQ implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

#### Include File

```
#include <l4/sys/scheduler.h>
```

### 13.1.11.10.2 Enumeration Type Documentation

#### 13.1.11.10.2.1 L4\_scheduler\_classes

```
enum L4_scheduler_classes
```

Supported scheduler classes.

#### Enumerator

<code>L4_SCHEDULER_CLASS_FIXED_PRIO</code>	Fixed-priority scheduler.
<code>L4_SCHEDULER_CLASS_WFQ</code>	Weighted fair queuing scheduler.

Definition at line 57 of file [scheduler.h](#).

### 13.1.11.10.2.2 L4\_scheduler\_ops

enum [L4\\_scheduler\\_ops](#)

Operations on the Scheduler object.

#### Enumerator

<code>L4_SCHEDULER_INFO_OP</code>	Query infos about the scheduler.
<code>L4_SCHEDULER_RUN_THREAD_OP</code>	Run a thread on this scheduler.
<code>L4_SCHEDULER_IDLE_TIME_OP</code>	Query idle time for the scheduler.

Definition at line [271](#) of file [scheduler.h](#).

### 13.1.11.10.3 Function Documentation

#### 13.1.11.10.3.1 l4\_sched\_cpu\_set()

```
l4_sched_cpu_set_t l4_sched_cpu_set (
    l4_umword_t offset,
    unsigned char granularity,
    l4_umword_t map = 1 ) [inline]
```

#### Parameters

<i>offset</i>	Offset. Must be a multiple of $2^{\text{granularity}}$ .
<i>granularity</i>	Granularity in log2 notation.
<i>map</i>	Bitmap of CPUs, defaults to 1 in C++.

#### Returns

CPU set.

#### Examples

[examples/sys/migrate/thread\\_migrate.cc](#).

Definition at line [281](#) of file [scheduler.h](#).

References [l4\\_sched\\_cpu\\_set\\_t::gran\\_offset](#), and [l4\\_sched\\_cpu\\_set\\_t::map](#).

Referenced by [l4\\_sched\\_param\(\)](#).

Here is the caller graph for this function:

### 13.1.11.10.3.2 l4\_sched\_param()

```
l4_sched_param_t l4_sched_param (
    unsigned prio,
    l4_umword_t quantum = 0 ) [inline]
```

Construct scheduler parameter.

The `l4_sched_param_t::affinity` of the returned value contains all CPUs.

#### Examples

`examples/sys/aliens/main.c`, `examples/sys/migrate/thread_migrate.cc`, `examples/sys/singlestep/main.c`, `examples/sys/start-with-exc/main.c`, and `examples/sys/utcb-ipc/main.c`.

Definition at line 291 of file `scheduler.h`.

References `l4_sched_param_t::affinity`, `l4_sched_cpu_set()`, `l4_sched_param_t::prio`, and `l4_sched_param_t::quantum`.

Here is the call graph for this function:

### 13.1.11.10.3.3 l4\_scheduler\_idle\_time()

```
l4_msgtag_t l4_scheduler_idle_time (
    l4_cap_idx_t scheduler,
    l4_sched_cpu_set_t const * cpus,
    l4_kernel_clock_t * us ) [inline]
```

Query the idle time (in  $\mu$ s) of a CPU.

#### Parameters

	<i>scheduler</i>	Scheduler object.
	<i>cpus</i>	Set of CPUs to query. Only the idle time of the first selected CPU in <code>cpus.map</code> is queried.
out	<i>us</i>	Idle time of queried CPU in $\mu$ s.

#### Return values

0	Success.
-L4_EINVAL	Invalid CPU requested in cpu set.

This function retrieves the idle time in  $\mu\text{s}$  of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate  $l$  one has to retrieve the idle time at the beginning ( $i1$ ) and the end ( $i2$ ) of a known time interval  $t$ . The load is then calculated as  $l = 1 - (i2 - i1)/t$ .

The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting `-L4_EINVAL` or calculating an estimated (incorrect) load of 1.

#### Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

Definition at line 405 of file `scheduler.h`.

References `l4_utcb()`.

Here is the call graph for this function:

#### 13.1.11.10.3.4 l4\_scheduler\_info()

```

l4_msgtag_t l4_scheduler_info (
    l4_cap_idx_t scheduler,
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus ) [inline]
  
```

Get scheduler information.

#### Parameters

	<i>scheduler</i>	Scheduler object.
out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be NULL.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpusgranularity</i> (see <code>l4_sched_cpu_set_t</code> ). <i>cpus.map</i> Bitmap of online CPUs. Must not be NULL.

#### Return values

0	Success.
<code>-L4_ERANGE</code>	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 383 of file [scheduler.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.10.3.5 l4\_scheduler\_info\_with\_classes()

```

l4_msgtag_t l4_scheduler_info_with_classes (
    l4_cap_idx_t scheduler,
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus,
    l4_umword_t * sched_classes ) [inline]
  
```

Get scheduler information.

#### Parameters

	<i>scheduler</i>	Scheduler object.
out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be NULL.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpus.granularity</i> (see <a href="#">l4_sched_cpu_set_t</a> ). <i>cpus.map</i> Bitmap of online CPUs. Must not be NULL.
out	<i>sched_classes</i>	A bitmap of available scheduling classes (see <a href="#">L4_scheduler_classes</a> ). Optional, can be NULL.

#### Return values

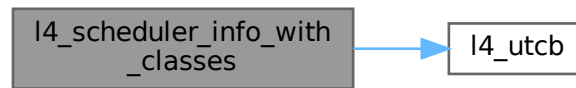

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

This function delivers the same information as [l4\\_scheduler\\_info](#) plus the available scheduler classes (see [L4\\_scheduler\\_classes](#)).

Definition at line 390 of file [scheduler.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.10.3.6 l4\_scheduler\_is\_online()

```
int l4_scheduler_is_online (
    l4_cap_idx_t scheduler,
    l4_umword_t cpu ) [inline]
```

Query if a CPU is online.

##### Parameters

<i>scheduler</i>	Scheduler object.
<i>cpu</i>	CPU number whose online status should be queried.

##### Return values

<i>true</i>	The CPU is online.
<i>false</i>	The CPU is offline

Definition at line 412 of file [scheduler.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.10.3.7 l4\_scheduler\_run\_thread()

```
l4_msgtag_t l4_scheduler_run_thread (
    l4_cap_idx_t scheduler,
```

```
l4_cap_idx_t thread,
l4_sched_param_t const * sp ) [inline]
```

Run a thread on a Scheduler.

#### Parameters

<i>scheduler</i>	Scheduler object.
<i>thread</i>	Capability of the thread to run.
<i>sp</i>	Scheduling parameters.

#### Return values

0	Success.
-L4_EINVAL	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

#### Note

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 398 of file [scheduler.h](#).

*Add kernel-user memory.*

#### 13.1.11.11.1 Detailed Description

C interface of the Task kernel object, see [L4::Task](#) for the C++ interface.

A task represents a combination of the address spaces provided by the [L4Re](#) micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space.

Task objects are created using the [Factory](#) interface.

### Include File

```
#include <l4/sys/task.h>
```

### 13.1.11.11.2 Enumeration Type Documentation

#### 13.1.11.11.2.1 l4\_unmap\_flags\_t

enum [l4\\_unmap\\_flags\\_t](#)

Flags for the unmap operation.

See also

[L4::Task::unmap\(\)](#) and [l4\\_task\\_unmap\(\)](#)

Enumerator

<a href="#">L4_FP_ALL_SPACES</a>	<p>Flag to tell the unmap operation to revoke permissions from all child mappings including the mapping in the invoked task.</p> <p><b>Note</b></p> <p>Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task. An unmap operation on object capabilities is a no-op if this flag is not specified.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p>
<a href="#">L4_FP_DELETE_OBJ</a>	<p>Flag that indicates that an unmap operation on object capabilities shall try to delete the corresponding objects immediately. This flag implies the <a href="#">L4_FP_ALL_SPACES</a> flag. The concept of deletion is only applicable to kernel objects. Therefore, for memory and I/O port capabilities, this flag has the same effect as <a href="#">L4_FP_ALL_SPACES</a> alone.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p>
<a href="#">L4_FP_OTHER_SPACES</a>	<p>Counterpart to <a href="#">L4_FP_ALL_SPACES</a>; revoke permissions from child mappings only.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p>

### 13.1.11.11.3 Function Documentation

#### 13.1.11.11.3.1 l4\_task\_add\_ku\_mem()

```
l4\_msgtag\_t l4_task_add_ku_mem (
    l4\_cap\_idx\_t task,
    l4\_fpage\_t * ku_mem ) [inline]
```

Add kernel-user memory.

## Parameters

	<i>task</i>	Capability selector of the task to add the memory to.
<i>in, out</i>	<i>ku_mem</i>	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

## Returns

Syscall return tag

Kernel-user memory (ku\_mem) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see [l4\\_thread\\_control\\_bind\(\)](#)) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

## Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page (`L4_PAGE_SIZE`). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on [L4::Task](#) objects. It might or might not work on [L4::Vm](#) objects or on [L4Re::Dma\\_space](#) objects but there is no practical use for adding kernel-user memory to [L4::Vm](#) objects or to [L4Re::Dma\\_space](#) objects.

Definition at line 468 of file [task.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## 13.1.11.11.3.2 l4\_task\_cap\_equal()

```

l4_msgtag_t l4_task_cap_equal (
    l4_cap_idx_t task,
    l4_cap_idx_t cap_a,
    l4_cap_idx_t cap_b ) [inline]
  
```

Test whether two capabilities point to the same object with the same rights.

## Parameters

<i>task</i>	Capability selector of the destination task to do the lookup in
<i>cap<sub>a</sub></i>	Capability selector to compare
<i>cap<sub>b</sub></i>	Capability selector to compare

**Returns**

label contains 1 if equal, 0 if not equal

Definition at line 461 of file [task.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.11.3.3 l4\_task\_cap\_valid()**

```

l4_msgtag_t l4_task_cap_valid (
    l4_cap_idx_t task,
    l4_cap_idx_t cap ) [inline]
  
```

Check whether a capability is present (refers to an object).

**Parameters**

<i>task</i>	Task to check the capability in.
<i>cap</i>	Valid capability to check for presence.

**Return values**

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object).

A capability is considered present when it refers to an existing kernel object.

**Precondition**

*cap* must be a valid capability index (i.e. not L4\_INVALID\_CAP or the like).

Definition at line 455 of file [task.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.11.3.4 l4\_task\_delete\_obj()

```

l4_msgtag_t l4_task_delete_obj (
    l4_cap_idx_t task,
    l4_cap_idx_t obj ) [inline]
  
```

Release capability and delete object.

##### Parameters

<i>task</i>	Capability selector of destination task.
<i>obj</i>	Capability index of the object to delete.

##### Returns

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.

If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)

This operation is equivalent to [l4\\_task\\_unmap\(\)](#) with `L4_FP_DELETE_OBJ` flag.

Definition at line [434](#) of file [task.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.11.3.5 l4\_task\_map()

```
l4_msgtag_t l4_task_map (
    l4_cap_idx_t dst_task,
    l4_cap_idx_t src_task,
    l4_fpage_t snd_fpage,
    l4_umword_t snd_base ) [inline]
```

Map resources available in the source task to a destination task.

#### Parameters

<i>dst_task</i>	Capability selector of the destination task.
<i>src_task</i>	Capability selector of the source task.
<i>snd_fpage</i>	Send flexpage that describes an area in the address space or object space of the source task.
<i>snd_base</i>	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see <a href="#">l4_fpage_cacheability_opt_t</a> for memory mappings, <a href="#">L4_obj_fpage_ctl</a> for object mappings, and <a href="#">L4_MAP_ITEM_GRANT</a> ; also see <a href="#">l4_map_control()</a> and <a href="#">l4_map_obj_control()</a> ).

#### Returns

Syscall return tag. The function [l4\\_error\(\)](#) shall be used to test if the map operation was successful.

#### Return values

<i>L4_EOK</i>	Operation successful (but see notes below).
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on <i>dst_task</i> .
<i>-L4_EINVAL</i>	Invalid source task capability.
<i>-L4_IPC_SEMAPFAILED</i>	The map operation failed due to limited quota.

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The receive window is the whole address space of *dst\_task*. By specifying proper rights in *snd\_fpage* and *snd\_base*, it is possible to remove rights during transfer.

#### Note

If the send flex page is of type [L4\\_FPAGE\\_OBJ](#), the [L4\\_CAP\\_FPAGE\\_S](#) right is removed from the transferred capability unless both the source and destination task capabilities possess the [L4\\_CAP\\_FPAGE\\_S](#) right themselves.

Even with [l4\\_error\(\)](#) returning [L4\\_EOK](#) there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

For more information on spaces and mappings, see [Spaces and Mappings](#). The flexpage API is described in more detail at [Flex pages](#).

**Note**

For peculiarities when using grant, see [L4\\_MAP\\_ITEM\\_GRANT](#).

Definition at line 404 of file [task.h](#).

References [l4\\_utcb\(\)](#).

Referenced by [L4::Cap\\_base::copy\(\)](#), and [L4::Cap\\_base::move\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.11.11.3.6 l4\_task\_release\_cap()

```

l4_msgtag_t l4_task_release_cap (
    l4_cap_idx_t task,
    l4_cap_idx_t cap ) [inline]
  
```

Release object capability.

**Parameters**

<i>task</i>	Capability selector of destination task
<i>cap</i>	Capability selector of object to release

**Returns**

Syscall return tag

This operation unmaps the capability from the specified task.

**Note**

If the reference counter of the kernel object referenced by `cap` goes down to zero, deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 449 of file [task.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.11.3.7 l4\_task\_unmap()**

```

l4_msgtag_t l4_task_unmap (
    l4_cap_idx_t task,
    l4_fpage_t fpage,
    l4_umword_t map_mask ) [inline]
  
```

Revoke rights from the task.

**Parameters**

<i>task</i>	Capability selector of destination task
<i>fpage</i>	Flexpage that describes an area in one capability space of the destination task
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>

**Returns**

Syscall return tag

This method allows to revoke rights from the destination task. For a flex page describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). If the set of rights is empty after the revocation, the capability is unmapped. It is guaranteed that the rights revocation is completed before this function returns.

**Note**

If the reference counter of a kernel object referenced in `fpage` goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

**Examples**

[examples/sys/utcb-ipc/main.c](#).

Definition at line 411 of file [task.h](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**13.1.11.11.3.8 l4\_task\_unmap\_batch()**

```

l4_msgtag_t l4_task_unmap_batch (
    l4_cap_idx_t task,
    l4_fpage_t const * fpages,
    unsigned num_fpages,
    l4_umword_t map_mask ) [inline]
  
```

Revoke rights from a task.

**Parameters**

<i>task</i>	Capability selector of destination task
<i>fpages</i>	An array of flexpages. Each item describes an area in one capability space of the destination task.
<i>num_fpages</i>	The size of the fpages array in elements (number of fpages sent).
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>

**Returns**

Syscall return tag

Revoke rights specified in an array of flexpages, see [l4\\_task\\_unmap](#) for details.

**Precondition**

The caller needs to take care that `num_fpages` is not bigger than `L4_UTCB_GENERIC_DATA_SIZE - 2`.

Definition at line [418](#) of file [task.h](#).

### 13.1.11.12.1 Detailed Description

C Thread object interface, see [L4::Thread](#) for the C++ interface.

An [L4](#) thread is a thread of execution in the [L4](#) context. Usually user-level and kernel threads are mapped 1:1 to each other. Thread kernel objects are created using a factory, see [Factory](#) (`l4_factory_create_thread()`).

Amongst other things an [L4](#) thread encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the [Scheduler](#) API
- Execution state
  - Blocked, Runnable, Running

Thread objects provide an API for

- Thread configuration and manipulation
- Thread switching.

The thread control functions are used to control various aspects of a thread. See `l4_thread_control_start()` for more information.

#### Include File

```
#include <l4/sys/thread.h>
```

For the C++ interface refer to [L4::Thread](#).

### 13.1.11.12.2 Enumeration Type Documentation

#### 13.1.11.12.2.1 L4\_thread\_control\_flags

```
enum L4_thread_control_flags
```

Flags for the thread control operation.

## Enumerator

L4_THREAD_CONTROL_SET_PAGER	The pager will be given.
L4_THREAD_CONTROL_BIND_TASK	The task to bind the thread to will be given.
L4_THREAD_CONTROL_ALIEN	Alien state of the thread is set.
L4_THREAD_CONTROL_UX_NATIVE	Fiasco-UX only: pass-through of host system calls is set.
L4_THREAD_CONTROL_SET_EXC_HANDLER	The exception handler of the thread will be given.

Definition at line 721 of file [thread.h](#).

## 13.1.11.12.2.2 L4\_thread\_control\_mr\_indices

```
enum L4_thread_control_mr_indices
```

Indices for the values in the message register for thread control.

## Enumerator

L4_THREAD_CONTROL_MR_IDX_FLAGS	See also <a href="#">L4_thread_control_flags</a> .
L4_THREAD_CONTROL_MR_IDX_PAGER	Index for pager cap.
L4_THREAD_CONTROL_MR_IDX_EXC_HANDLER	Index for exception handler.
L4_THREAD_CONTROL_MR_IDX_FLAG_VALS	Index for feature values.
L4_THREAD_CONTROL_MR_IDX_BIND_UTCB	Index for UTCB address for bind.
L4_THREAD_CONTROL_MR_IDX_BIND_TASK	Index for task flex-page for bind.

Definition at line 744 of file [thread.h](#).

## 13.1.11.12.2.3 L4\_thread\_ex\_regs\_flags

```
enum L4_thread_ex_regs_flags
```

Flags for the thread ex-regs operation.

## Enumerator

L4_THREAD_EX_REGS_CANCEL	Cancel ongoing IPC in the thread.
L4_THREAD_EX_REGS_TRIGGER_EXCEPTION	Trigger artificial exception in thread.
L4_THREAD_EX_REGS_ARCH_MASK	Arch specific flags.

Definition at line 759 of file [thread.h](#).

## 13.1.11.12.2.4 L4\_thread\_ex\_regs\_flags\_arm

```
enum L4_thread_ex_regs_flags_arm
```

Arm specific [L4::Thread::ex\\_regs\(\)](#) flags.

Only one option must be used in calls to [L4::Thread::ex\\_regs\(\)](#). Using more than one option results in undefined behaviour.

#### Enumerator

L4_THREAD_EX_REGS_ARM_SET_EL_MASK	Exception level set mask.
L4_THREAD_EX_REGS_ARM_SET_EL_KEEP	Keep current exception level of thread (default).
L4_THREAD_EX_REGS_ARM_SET_EL_EL0	Set exception level of thread to EL0 (usr mode).
L4_THREAD_EX_REGS_ARM_SET_EL_EL1	Set exception level of thread to EL1 (sys mode).

Definition at line 53 of file [thread.h](#).

### 13.1.11.12.3 Function Documentation

#### 13.1.11.12.3.1 l4\_thread\_arm\_set\_tpidruro()

```
l4_msgtag_t l4_thread_arm_set_tpidruro (
    l4_cap_idx_t thread,
    l4_addr_t tpidruro ) [inline]
```

Set the TPIDRURO thread specific register.

#### Parameters

<i>thread</i>	Thread to manipulate
<i>tpidruro</i>	The value to be set

#### Returns

System call return tag

Definition at line 79 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.2 l4\_thread\_ex\_regs()

```
l4_msgtag_t l4_thread_ex_regs (
    l4_cap_idx_t thread,
    l4_addr_t ip,
    l4_addr_t sp,
    l4_umword_t flags ) [inline]
```

Exchange basic thread registers.

#### Parameters

<i>thread</i>	Capability selector of the thread to manipulate.
<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged.
<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> .

#### Returns

System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

The thread is started using [l4\\_scheduler\\_run\\_thread\(\)](#). However, if at the time [l4\\_scheduler\\_run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [l4\\_thread\\_ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

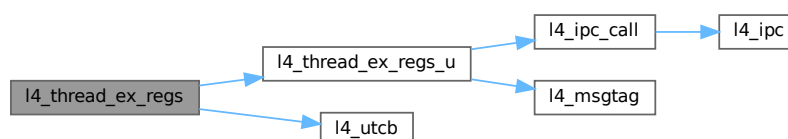

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 912 of file [thread.h](#).

References [l4\\_thread\\_ex\\_regs\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.3 `l4_thread_ex_regs_ret()`

```
l4_msgtag_t l4_thread_ex_regs_ret (
    l4_cap_idx_t thread,
    l4_addr_t * ip,
    l4_addr_t * sp,
    l4_umword_t * flags ) [inline]
```

Exchange basic thread registers and return previous values.

#### Parameters

	<i>thread</i>	Capability selector of the thread to manipulate.
in, out	<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.

#### Returns

System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

The thread is started using [l4\\_scheduler\\_run\\_thread\(\)](#). However, if at the time [l4\\_scheduler\\_run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [l4\\_thread\\_ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

Returned values are valid only if function returns successfully.

Definition at line 919 of file [thread.h](#).

References [l4\\_thread\\_ex\\_regs\\_ret\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.4 `l4_thread_ex_regs_ret_u()`

```
l4_msgtag_t l4_thread_ex_regs_ret_u (
    l4_cap_idx_t thread,
    l4_addr_t * ip,
    l4_addr_t * sp,
    l4_umword_t * flags,
    l4_utcb_t * utcb ) [inline]
```

Exchange basic thread registers and return previous values.

## Parameters

	<i>thread</i>	Capability selector of the thread to manipulate.
in, out	<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use [l4\\_error\(\)](#) to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see *flags*). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

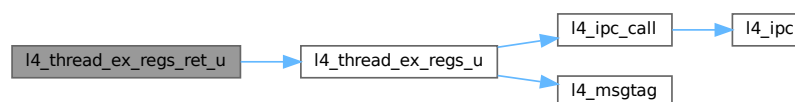

The thread is started using [L4::Scheduler::run\\_thread\(\)](#). However, if at the time [L4::Scheduler::run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to *ex\_regs()* with a valid instruction pointer might start the thread.

Referenced by [L4::Thread::ex\\_regs\(\)](#), and [l4\\_thread\\_ex\\_regs\\_ret\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

13.1.11.12.3.5 `l4_thread_ex_regs_u()`

```
l4_msgtag_t l4_thread_ex_regs_u (
    l4_cap_idx_t thread,
    l4_addr_t ip,
    l4_addr_t sp,
    l4_umword_t flags,
    l4_utcb_t * utcb ) [inline]
```

Exchange basic thread registers.

## Parameters

<i>thread</i>	Capability selector of the thread to manipulate.
<i>ip</i>	New instruction pointer, use <code>~0UL</code> to leave the instruction pointer unchanged.
<i>sp</i>	New stack pointer, use <code>~0UL</code> to leave the stack pointer unchanged.
<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

System call return tag.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

The thread is started using [L4::Scheduler::run\\_thread\(\)](#). However, if at the time [L4::Scheduler::run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to `ex_regs()` with a valid instruction pointer might start the thread.

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.11.12.3.6 l4\_thread\_modify\_sender\_add()

```

int l4_thread_modify_sender_add (
    l4_umword_t match_mask,
    l4_umword_t match,
    l4_umword_t del_bits,
    l4_umword_t add_bits,
    l4_msgtag_t * tag ) [inline]

```

Add a modification pattern to a sender modification sequence.

#### Parameters

<i>tag</i>	Tag received from <a href="#">l4_thread_modify_sender_start()</a> or previous <a href="#">l4_thread_modify_sender_add()</a> calls from the same sequence.
<i>match_mask</i>	Bitmask of bits to match the label.
<i>match</i>	Bitmask that must be equal to the label after applying <i>match_mask</i> .
<i>del_bits</i>	Bits to be deleted from the label.
<i>add_bits</i>	Bits to be added to the label.

#### Returns

0 on success, <0 on error

In pseudo code: if ((sender\_label & match\_mask) == match) { sender\_label = (sender\_label & ~del\_bits) | add\_bits; }

Only the first match is applied.

#### See also

[l4\\_thread\\_modify\\_sender\\_start](#)  
[l4\\_thread\\_modify\\_sender\\_commit](#)

Definition at line 1092 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.12.3.7 l4\_thread\_modify\_sender\_commit()

```
l4_msgtag_t l4_thread_modify_sender_commit (  
    l4_cap_idx_t thread,  
    l4_msgtag_t tag ) [inline]
```

Apply (commit) a sender modification sequence.

The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.

##### Note

Modifying the senders of a thread running on a different CPU core is not supported.

##### See also

[l4\\_thread\\_modify\\_sender\\_start](#)  
[l4\\_thread\\_modify\\_sender\\_add](#)

Definition at line 1103 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.8 l4\_thread\_modify\_sender\_start()

```
l4_msgtag_t l4_thread_modify_sender_start (
    void ) [inline]
```

Start a thread sender modification sequence.

Add modification rules with [l4\\_thread\\_modify\\_sender\\_add\(\)](#) and commit with [l4\\_thread\\_modify\\_sender\\_commit\(\)](#). Do not touch the UTCB between [l4\\_thread\\_modify\\_sender\\_start\(\)](#) and [l4\\_thread\\_modify\\_sender\\_commit\(\)](#).

This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- a thread was unbound from an IPC gate / IRQ, or
- an IPC gate /IRQ was removed, or
- the label of an IPC gate /IRQ bound to a thread was changed.

It is not required to perform the modify\_sender mechanism after an IPC gate or an IRQ was bound to a thread for the first time.

[l4\\_thread\\_modify\\_sender\\_commit](#)

Definition at line 1086 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.9 l4\_thread\_register\_del\_irq()

```
l4_msgtag_t l4_thread_register_del_irq (
    l4_cap_idx_t thread,
    l4_cap_idx_t irq ) [inline]
```

Register an IRQ that will trigger upon deletion events.

## Parameters

<i>thread</i>	Thread to register IRQ for.
<i>irq</i>	Capability selector for the IRQ object to be triggered.

## Returns

System call return tag containing the return code.

## Return values

<code>-L4_EPERM</code>	<code>L4_CAP_FPAGE_W</code> missing on <code>irq</code>
------------------------	---

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion `Irq` can only be deregistered by deleting the `Irq` or the thread.

List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.

Definition at line 1013 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

## 13.1.11.12.3.10 l4\_thread\_stats\_time()

```

l4_msgtag_t l4_thread_stats_time (
    l4_cap_idx_t thread,
    l4_kernel_clock_t * us ) [inline]
  
```

Get consumed time of thread in  $\mu$ s.

## Parameters

	<i>thread</i>	Thread to get the consumed time from.
<i>out</i>	<i>us</i>	Consumed time in $\mu$ s.

**Returns**

system call return tag

Definition at line 981 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.11.12.3.11 l4\_thread\_switch()**

```
l4_msgtag_t l4_thread_switch (
    l4_cap_idx_t to_thread ) [inline]
```

Switch to another thread (and donate the remaining time slice).

**Parameters**

<i>to_thread</i>	The thread to switch to.
------------------	--------------------------

**Returns**

system call return tag

Definition at line 972 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.12 l4\_thread\_vcpu\_control()

```
l4_msgtag_t l4_thread_vcpu_control (
    l4_cap_idx_t thread,
    l4_addr_t vcpu_state ) [inline]
```

Enable the vCPU feature for the thread.

#### Parameters

<i>thread</i>	Capability selector of the thread for which the vCPU feature shall be enabled.
<i>vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">l4_task_add_ku_mem()</a> ).

#### Returns

Syscall return tag.

This function enables the vCPU feature of the `thread`.

The kernel-user memory area starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of [l4\\_vcpu\\_state\\_t](#).

#### Note

Disabling of the vCPU feature is optional and currently not supported.

Definition at line 1030 of file [thread.h](#).

References [l4\\_thread\\_vcpu\\_control\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.11.12.3.13 l4\_thread\_vcpu\_control\_ext()

```
l4_msgtag_t l4_thread_vcpu_control_ext (
    l4_cap_idx_t thread,
    l4_addr_t ext_vcpu_state ) [inline]
```

Enable the extended vCPU feature for the thread.

## Parameters

<i>thread</i>	Capability selector of the thread for which the extended vCPU feature shall be enabled.
<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">l4_task_add_ku_mem()</a> ).

## Returns

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT or AMD's SVM.

This function enables the extended vCPU feature of the `thread`. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of [l4\\_vcpu\\_state\\_t](#) at offset 0, the extended vCPU state at offset `L4_VCPU_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_EXT_INFOS`.

## Note

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

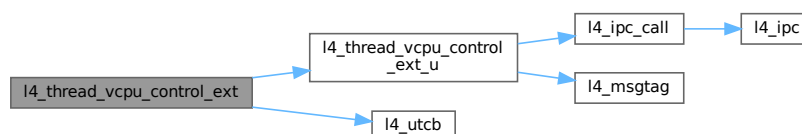

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 1045 of file [thread.h](#).

References [l4\\_thread\\_vcpu\\_control\\_ext\\_u\(\)](#), and [l4\\_utcb\(\)](#).

### 13.1.11.12.3.14 l4\_thread\_vcpu\_control\_ext\_u()

```

l4_msgtag_t l4_thread_vcpu_control_ext_u (
    l4_cap_idx_t thread,
    l4_addr_t ext_vcpu_state,
    l4_utcb_t * utcb ) [inline]

```

Enable the extended vCPU feature for the thread.

## Parameters

<i>thread</i>	Capability selector of the thread for which the extended vCPU feature shall be enabled.
<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT or AMD's SVM.

This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of [l4\\_vcpu\\_state\\_t](#) at offset 0, the extended vCPU state at offset `L4_VCPU_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_EXT_INFOS`.

## Note

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

### 13.1.11.12.3.15 l4\_thread\_vcpu\_control\_u()

```
l4_msgtag_t l4_thread_vcpu_control_u (
    l4_cap_idx_t thread,
    l4_addr_t vcpu_state,
    l4_utcb_t * utcb ) [inline]
```

Enable the vCPU feature for the thread.

#### Parameters

<i>thread</i>	Capability selector of the thread for which the vCPU feature shall be enabled.
<i>vcpu_state</i>	A virtual address pointing to a <a href="#">l4_vcpu_state_t</a> . It must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag.

This function enables the vCPU feature of `this` thread

The kernel-user memory starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of [l4\\_vcpu\\_state\\_t](#).

The asynchronous IPC handling is described at [vCPU API](#).

#### Note

Disabling of the vCPU feature is optional and currently not supported.

Definition at line [1020](#) of file [thread.h](#).

### 13.1.11.12.3.16 l4\_thread\_vcpu\_resume\_commit()

```
l4_msgtag_t l4_thread_vcpu_resume_commit (
    l4_cap_idx_t thread,
    l4_msgtag_t tag ) [inline]
```

Commit vCPU resume.

#### Parameters

<i>thread</i>	Thread to be resumed, the invalid cap can be used for the current thread.
<i>tag</i>	Tag to use, returned by <a href="#">l4_thread_vcpu_resume_start()</a>

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

0	Indicates a VM exit, provided that <i>thread</i> is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the <i>thread</i> is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.
-L4_EINVAL	<i>thread</i> is not the current running thread, or does not have the vCPU feature enabled.
<0	A supplied mapping failed.

All flex pages in the UTCB (added with [l4\\_sndfpage\\_add\(\)](#) after [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#)) are unconditionally mapped into the user task configured in the vCPU state.

To resume into another address space, the capability to the target [Task](#) (or [L4::Vm](#)) must be set in [l4\\_vcpu\\_state\\_t::user\\_task](#) together with [L4\\_VCPU\\_F\\_USER\\_MODE](#). The capability selector must have all lower bits clear (see [L4\\_CAP\\_MASK](#)). The kernel adds the [L4\\_SYSF\\_SEND](#) flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the [L4\\_SYSF\\_REPLY](#) flag set.

### 13.1.11.12.4.1 Detailed Description

API for Thread Control method.

The thread control API provides access to almost any parameter of a thread object. The API is based on a single invocation of the thread object. However, because of the huge amount of parameters, the API provides a set of functions to set specific parameters of a thread and a commit function to commit the thread control call (see [l4\\_thread\\_control\\_commit\(\)](#)).

A thread control operation must always start with [l4\\_thread\\_control\\_start\(\)](#) and be committed with [l4\\_thread\\_control\\_commit\(\)](#). All other thread control parameter setter functions must be called between these two functions.

An example for a sequence of thread control API calls can be found below.

```
l4\_thread\_control\_start();
l4\_thread\_control\_pager(pager\_cap);
l4\_thread\_control\_bind (thread\_utcb, task);
l4\_thread\_control\_commit(thread\_cap);
```

### 13.1.11.12.4.2 Function Documentation

#### [l4\\_thread\\_control\\_alien\(\)](#)

```
void l4_thread_control_alien (
    int on ) [inline]
```

Enable alien mode.

#### Parameters

<i>on</i>	Boolean value defining the state of the feature.
-----------	--

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the

alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the syscall arguments. If the exception handler replies with [L4\\_PROTO\\_ALLOW\\_SYSCALL](#) as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.

This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as [L4Re](#).

#### Examples

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 951 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### **`l4_thread_control_bind()`**

```
void l4_thread_control_bind (
    l4_utcb_t * thread_utcb,
    l4_cap_idx_t task ) [inline]
```

Bind the thread to a task.

#### Parameters

<i>thread_utcb</i>	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least L4_UTCB_OFFSET bytes of kernel-user memory.
<i>task</i>	The task the thread shall be bound to.

#### Precondition

The thread must not be bound to a task yet.

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, [l4\\_thread\\_ex\\_regs\(\)](#) needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

**Note**

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 945 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**`l4_thread_control_commit()`**

```
l4_msgtag_t l4_thread_control_commit (
    l4_cap_idx_t thread ) [inline]
```

Commit the thread control parameters.

**Parameters**

<i>thread</i>	Capability selector of target thread to commit to.
---------------	--

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> right on <i>thread</i> or the task capability set in <a href="#">l4_thread_control_bind()</a> .
<i>-L4_EINVAL</i>	Malformed thread control parameters.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 963 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### **`l4_thread_control_exc_handler()`**

```
void l4_thread_control_exc_handler (
    l4_cap_idx_t exc_handler ) [inline]
```

Set the exception handler.

#### **Parameters**

<i>exc_handler</i>	Capability selector invoked to send an exception IPC.
--------------------	---

#### **Note**

The exception-handler capability selector is interpreted in the task the thread is bound to (executes in).

#### **Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 938 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**l4\_thread\_control\_pager()**

```
void l4_thread_control_pager (
    l4_cap_idx_t pager ) [inline]
```

Set the pager.

**Parameters**

<i>pager</i>	Capability selector invoked to send a page-fault IPC.
--------------	---

**Note**

The pager capability selector is interpreted in the task the thread is bound to (executes in).

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 932 of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**l4\_thread\_control\_start()**

```
void l4_thread_control_start (
    void ) [inline]
```

Start a thread control API sequence.

This function starts a sequence of thread control API functions. After this functions any of following functions may be called in any order.

- [l4\\_thread\\_control\\_pager\(\)](#)
- [l4\\_thread\\_control\\_exc\\_handler\(\)](#)
- [l4\\_thread\\_control\\_bind\(\)](#)
- [l4\\_thread\\_control\\_alien\(\)](#)
- [l4\\_thread\\_control\\_ux\\_host\\_syscall\(\)](#) (Fiasco-UX only)

To commit the changes to the thread [l4\\_thread\\_control\\_commit\(\)](#) must be called in the end.

**Note**

The thread control API calls store the parameters for the thread in the UTCB of the caller (see [l4\\_utcb\(\)](#)), this means between [l4\\_thread\\_control\\_start\(\)](#) and [l4\\_thread\\_control\\_commit\(\)](#) no functions that modify the UTCB contents must be called.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line [926](#) of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**`l4_thread_control_ux_host_syscall()`**

```
void l4_thread_control_ux_host_syscall (
    int on ) [inline]
```

Enable pass through of native host (Linux) system calls.

**Parameters**

<i>on</i>	Boolean value defining the state of the feature.
-----------	--

**Precondition**

Running on Fiasco-UX

This enables the thread to do host system calls. This feature is only available in Fiasco-UX and ignored in other environments.

Definition at line [957](#) of file [thread.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

- Offsets for vCPU state layouts.*

### 13.1.11.12.5.1 Detailed Description

vCPU API.

The vCPU API in [L4Re](#) implements virtual processors (vCPUs) on top of [L4::Thread](#). This API can be used for user level threading, operating system rehosting (see [L4Linux](#)) and virtualization.

You switch a thread into vCPU operation with [L4::Thread::vcpu\\_control](#).

In vCPU mode, incoming IPC can be redirected to a handler function. If an IPC is sent to the vCPU, the thread's normal execution is interrupted and the handler called. Which kind of IPC is redirected is specified by the [L4\\_vcpu\\_state\\_flags](#) set in the [l4\\_vcpu\\_state\\_t::state](#) field of [vcpu\\_state](#). All events enabled in the [vcpu\\_state](#) field are redirected to the handler. The handler is set via [l4\\_vcpu\\_state\\_t::entry\\_ip](#) and [l4\\_vcpu\\_state\\_t::entry\\_sp](#). IPC redirection works independent of "kernel" and "user" mode, but see [l4\\_vcpu\\_state\\_t::entry\\_sp](#). When the entry handler is called, the UTCB contains the result of the IPC and content normally found in CPU register is in [l4\\_vcpu\\_state\\_t::i](#).

Furthermore, the thread can execute in the context of different tasks, called the "kernel" and the "user" mode. The kernel task is the one to which the thread was originally bound via [L4::Thread::control\(\)](#). Execution starts in the kernel task and it is always switched to when the asynchronous IPC handler is invoked. When returning from the handler via [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#) and [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#), a different user task can be specified by setting [l4\\_vcpu\\_state\\_t::user\\_task](#) and enabling the [L4\\_VCPU\\_F\\_USER\\_MODE](#) flag in [l4\\_vcpu\\_state\\_t::state](#). Note that the kernel may cache the user task internally, see [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#).

If the [L4\\_VCPU\\_F\\_USER\\_MODE](#) flag is enabled, the following flags will be automatically enabled in [l4\\_vcpu\\_state\\_t::state](#) on [L4::Thread::vcpu\\_resume\\_commit\(\)](#):

- [L4\\_VCPU\\_F\\_IRQ](#)
- [L4\\_VCPU\\_F\\_PAGE\\_FAULTS](#)
- [L4\\_VCPU\\_F\\_EXCEPTIONS](#)

When the kernel mode is entered, the following flags will be automatically disabled in [l4\\_vcpu\\_state\\_t::state](#):

- [L4\\_VCPU\\_F\\_IRQ](#)
- [L4\\_VCPU\\_F\\_PAGE\\_FAULTS](#)
- [L4\\_VCPU\\_F\\_USER\\_MODE](#)

Extended vCPU operation is used for hardware CPU virtualization. It can be enabled with [L4::Thread::vcpu\\_control\\_ext\(\)](#).

[vCPU Support Library](#) defines a convenience API for working with vCPUs.

See also

[vCPU Support Library](#)

### 13.1.11.12.5.2 Enumeration Type Documentation

#### L4\_vcpu\_state\_flags

enum [L4\\_vcpu\\_state\\_flags](#)

State flags of a vCPU.

Enumerator

<a href="#">L4_VCPU_F_IRQ</a>	<p>Receiving of IRQs and IPC enabled. While this flag is not set, the corresponding vCPU thread will not receive any IPC and threads attempting to send an IPC to this thread will block (according to the selected send timeout).</p> <p><b>Note</b></p> <p>On <a href="#">L4::Thread::vcpu_resume_commit()</a> this flag is automatically enabled in <a href="#">l4_vcpu_state_t::state</a> if <a href="#">L4_VCPU_F_USER_MODE</a> is enabled.</p> <p>When the kernel mode is entered, this flags is automatically disabled in <a href="#">l4_vcpu_state_t::state</a>.</p>
<a href="#">L4_VCPU_F_PAGE_FAULTS</a>	<p>Page faults enabled. If this flag is set, a page fault switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, a page fault generates a page fault IPC to the pager of the vCPU thread.</p> <p><b>Note</b></p> <p>IPC redirection for page faults controlled by this flag works independent of "kernel" and "user" mode.</p> <p>On <a href="#">L4::Thread::vcpu_resume_commit()</a> this flag is automatically enabled in <a href="#">l4_vcpu_state_t::state</a> if <a href="#">L4_VCPU_F_USER_MODE</a> is enabled.</p> <p>When the kernel mode is entered, this flags is automatically disabled in <a href="#">l4_vcpu_state_t::state</a>.</p>

## Enumerator

L4_VCPU_F_EXCEPTIONS	<p>Exceptions enabled. If this flag is set, then, on the event of an exception, the vCPU switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, an exception generates an exception IPC to the exception handler of the vCPU thread.</p> <p><b>Note</b></p> <p>IPC redirection for exceptions controlled by this flag works independent of "kernel" and "user" mode.</p> <p>On <a href="#">L4::Thread::vcpu_resume_commit()</a> this flag is automatically enabled in <a href="#">l4_vcpu_state_t::state</a> if <a href="#">L4_VCPU_F_USER_MODE</a> is enabled.</p>
L4_VCPU_F_USER_MODE	<p>User task will be used. If set, the vCPU switches to user mode on next <a href="#">L4::Thread::vcpu_resume_commit()</a>. If clear, the vCPU stays in "kernel" mode.</p> <p><b>Note</b></p> <p>When the kernel mode is entered, this flags is automatically disabled in <a href="#">l4_vcpu_state_t::state</a>.</p>
L4_VCPU_F_FPU_ENABLED	<p>FPU enabled. This flag is only relevant if <a href="#">L4_VCPU_F_USER_MODE</a> is set. Setting this flag allows code in vCPU mode to use the FPU. IF this flag is not set, any FPU operation will trigger a corresponding exception (FPU fault).</p>

### 13.1.11.13.1 Detailed Description

C Virtual console interface for simple character based input and output, see [L4::Vcon](#) for the C++ interface.

The interrupt for read events is provided by the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

#### Include File

```
#include <l4/sys/vcon.h>
```

See [L4::Vcon](#) for the C++ interface.

### 13.1.11.13.2 Typedef Documentation

#### 13.1.11.13.2.1 l4\_vcon\_attr\_t

```
typedef struct l4_vcon_attr_t l4_vcon_attr_t
```

Vcon attribute structure.

The flags members can be a combination of their respective enums.

See also

[L4\\_vcon\\_i\\_flags](#)

[L4\\_vcon\\_o\\_flags](#)

[L4\\_vcon\\_l\\_flags](#)

### 13.1.11.13.3 Enumeration Type Documentation

#### 13.1.11.13.3.1 L4\_vcon\_i\_flags

```
enum L4_vcon_i_flags
```

Input flags.

#### Enumerator

L4_VCON_INLCR	Translate NL to CR.
L4_VCON_IGNCR	Ignore CR.
L4_VCON_ICRNL	Translate CR to NL if L4_VCON_IGNCR is not set.

Definition at line 217 of file [vcon.h](#).

#### 13.1.11.13.3.2 L4\_vcon\_l\_flags

enum [L4\\_vcon\\_l\\_flags](#)

Local flags.

Enumerator

L4_VCON_ICANON	Canonical mode.
L4_VCON_ECHO	Echo input.

Definition at line 239 of file [vcon.h](#).

#### 13.1.11.13.3.3 L4\_vcon\_o\_flags

enum [L4\\_vcon\\_o\\_flags](#)

Output flags.

Enumerator

L4_VCON_ONLCR	Translate NL to CR-NL.
L4_VCON_OCRNL	Translate CR to NL.
L4_VCON_ONLRET	Do not output CR.

Definition at line 228 of file [vcon.h](#).

#### 13.1.11.13.3.4 L4\_vcon\_size\_consts

enum [L4\\_vcon\\_size\\_consts](#)

Size constants.

Enumerator

L4_VCON_WRITE_SIZE	Maximum size that can be written with one <code>l4_vcon_write</code> call.
L4_VCON_READ_SIZE	Maximum size that can be read with one <code>l4_vcon_read*</code> call.

Definition at line 106 of file [vcon.h](#).

### 13.1.11.13.4 Function Documentation

#### 13.1.11.13.4.1 l4\_vcon\_get\_attr()

```
l4\_msgtag\_t l4_vcon_get_attr (
```

```
l4_cap_idx_t vcon,
l4_vcon_attr_t * attr ) [inline]
```

Get attributes of a Vcon.

#### Parameters

	<i>vcon</i>	Vcon object.
out	<i>attr</i>	Attribute structure.

#### Returns

Syscall return tag

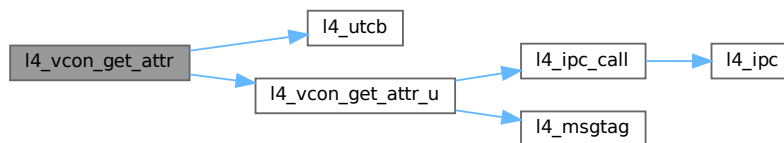

#### Examples

[examples/sys/isr/main.c](#).

Definition at line 444 of file [vcon.h](#).

References [l4\\_utcb\(\)](#), and [l4\\_vcon\\_get\\_attr\\_u\(\)](#).

Here is the call graph for this function:

#### 13.1.11.13.4.2 l4\_vcon\_get\_attr\_u()

```
l4_msgtag_t l4_vcon_get_attr_u (
    l4_cap_idx_t vcon,
    l4_vcon_attr_t * attr,
    l4_utcb_t * utcb ) [inline]
```

Get attributes of this virtual console.

#### Parameters

	<i>vcon</i>	Capability index of the vcon object.
out	<i>attr</i>	Attribute structure. Contains the attributes after a successful call of this function.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

Definition at line 426 of file [vcon.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_LOG](#), [L4\\_VCON\\_GET\\_ATTR\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

Referenced by [L4::Vcon::get\\_attr\(\)](#), and [l4\\_vcon\\_get\\_attr\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**13.1.11.13.4.3 l4\_vcon\_read()**

```

int l4_vcon_read (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size ) [inline]
  
```

Read data from virtual console.

**Parameters**

	<i>vcon</i>	Vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of buffer in bytes.

## Return values

<code>-L4_EPERM</code>	The Vcon instance requires the <a href="#">L4_CAP_FPAGE_W</a> right on the <code>vcon</code> capability and this right is not present.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

## Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

## Examples

[examples/sys/isr/main.c](#).

Definition at line [400](#) of file [vcon.h](#).

References [l4\\_utcb\(\)](#), and [l4\\_vcon\\_read\\_u\(\)](#).

Here is the call graph for this function:

## 13.1.11.13.4.4 l4\_vcon\_read\_u()

```

int l4_vcon_read_u (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size,
    l4_utcb_t * utcb ) [inline]
  
```

Read data from `this` virtual console.

## Parameters

	<i>vcon</i>	Capability index of the vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of the data buffer in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Return values

<code>-L4_EPERM</code>	The Vcon instance requires the <a href="#">L4_CAP_FPAGE_W</a> right on the capability used to invoke this operation and this right is not present.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

## Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 390 of file [vcon.h](#).

References [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

Referenced by [l4\\_vcon\\_read\(\)](#), and [L4::Vcon::read\(\)](#).

Here is the caller graph for this function:

## 13.1.11.13.4.5 l4\_vcon\_read\_with\_flags()

```

int l4_vcon_read_with_flags (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size ) [inline]
  
```

Read data from virtual console, extended version including flags.

## Parameters

	<i>vcon</i>	Vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of buffer in bytes.

If this function returns a positive value the caller can check the [L4\\_VCON\\_READ\\_STAT\\_BREAK](#) flag bit for a break condition. The bytes read can be obtained by masking the return value with [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.

`buf` might be a `NULL`, in this case the input data will be dropped.

#### Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

#### Return values

<code>-L4_EPERM</code>	The Vcon instance requires the <a href="#">L4_CAP_FPAGE_W</a> right on the <code>vcon</code> capability and this right is not present.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

Definition at line [384](#) of file [vcon.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.11.13.4.6 l4\_vcon\_send()

```

l4_msgtag_t l4_vcon_send (
    l4_cap_idx_t vcon,
    char const * buf,
    unsigned size ) [inline]
  
```

Send data to virtual console.

#### Parameters

<code>vcon</code>	Vcon object.
<code>buf</code>	Pointer to data buffer.
<code>size</code>	Size of buffer in bytes.

#### Returns

Syscall return tag

**Note**

Size must not exceed [L4\\_VCON\\_WRITE\\_SIZE](#), a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use [l4\\_ipc\\_error\(\)](#) to check for send errors, and **do not** use [l4\\_error\(\)](#).

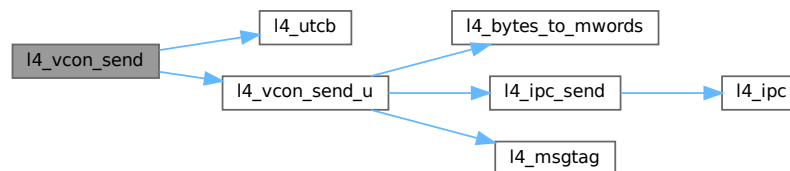

**Examples**

[examples/sys/utcb-ipc/main.c](#).

Definition at line 324 of file [vcon.h](#).

References [l4\\_utcb\(\)](#), and [l4\\_vcon\\_send\\_u\(\)](#).

Here is the call graph for this function:

**13.1.11.13.4.7 l4\_vcon\_send\_u()**

```

l4_msgtag_t l4_vcon_send_u (
    l4_cap_idx_t vcon,
    char const * buf,
    unsigned size,
    l4_utcb_t * utcb ) [inline]

```

Send data to this virtual console.

**Parameters**

<i>vcon</i>	Capability index of the Vcon object.
<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

## Note

Size must not exceed [L4\\_VCON\\_WRITE\\_SIZE](#), a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use [l4\\_ipc\\_error\(\)](#) to check for send errors, do not use [l4\\_error\(\)](#), as [l4\\_error\(\)](#) will always return an error.

Definition at line 311 of file [vcon.h](#).

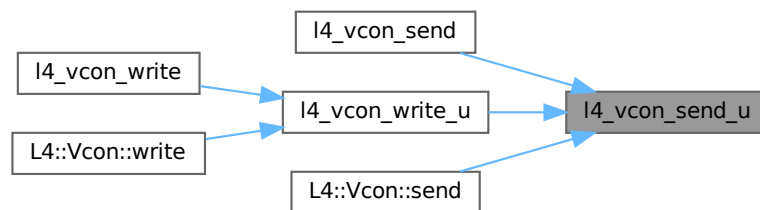

References [l4\\_bytes\\_to\\_mwords\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_ipc\\_send\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_MSGTAG\\_SCHEDULE](#), [L4\\_PROTO\\_LOG](#), [L4\\_VCON\\_WRITE\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

#### 13.1.11.13.4.8 l4\_vcon\_set\_attr()

```

l4_msgtag_t l4_vcon_set_attr (
    l4_cap_idx_t vcon,
    l4_vcon_attr_t const * attr ) [inline]
  
```

Set attributes of a Vcon.

## Parameters

<i>vcon</i>	Vcon object.
<i>attr</i>	Attribute structure.

## Returns

Syscall return tag

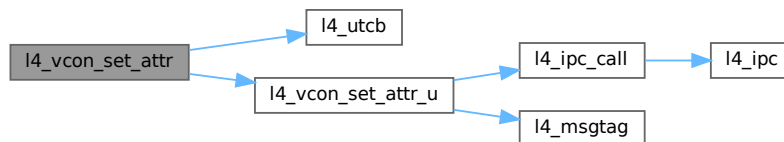

## Examples

[examples/sys/isr/main.c](#).

Definition at line 420 of file [vcon.h](#).

References [l4\\_utcb\(\)](#), and [l4\\_vcon\\_set\\_attr\\_u\(\)](#).

Here is the call graph for this function:

#### 13.1.11.13.4.9 l4\_vcon\_set\_attr\_raw()

```
void l4_vcon_set_attr_raw (
    l4_vcon_attr_t * attr ) [inline]
```

Set terminal attributes to disable all special processing.

Removes all flags that would mangle the read or written characters. Also disables echoing and any special processing of characters.

## Parameters

<i>in, out</i>	<i>attr</i>	Attribute structure to update.
----------------	-------------	--------------------------------

Definition at line 450 of file [vcon.h](#).

Referenced by [l4\\_vcon\\_attr\\_t::set\\_raw\(\)](#).

#### 13.1.11.13.4.10 l4\_vcon\_set\_attr\_u()

```

l4_msgtag_t l4_vcon_set_attr_u (
    l4_cap_idx_t vcon,
    l4_vcon_attr_t const * attr,
    l4_utcb_t * utcb ) [inline]
  
```

Set the attributes of `this` virtual console.

##### Parameters

<i>vcon</i>	Capability index of the vcon object.
<i>attr</i>	Attribute structure with the attributes for the virtual console.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag.

Definition at line 406 of file [vcon.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_LOG](#), [L4\\_VCON\\_SET\\_ATTR\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

Additional (virtual) VMCS fields.

## Functions

- [l4\\_uint64\\_t l4\\_vm\\_vmx\\_get\\_caps](#) (void const \*vcpu\_state, unsigned cap\_msr) [L4\\_NOTHROW](#)  
Get a capability register for VMX.
- [l4\\_uint32\\_t l4\\_vm\\_vmx\\_get\\_caps\\_default1](#) (void const \*vcpu\_state, unsigned cap\_msr) [L4\\_NOTHROW](#)  
Get a default to one capability register for VMX.
- unsigned [l4\\_vm\\_vmx\\_field\\_len](#) (unsigned field) [L4\\_NOTHROW](#)  
Return length in bytes of a VMCS field.
- unsigned [l4\\_vm\\_vmx\\_field\\_order](#) (unsigned field) [L4\\_NOTHROW](#)  
Return length in power of two (bytes) of a VMCS field.
- void [l4\\_vm\\_vmx\\_clear](#) (void \*vmcs, void \*user\_vmcs) [L4\\_NOTHROW](#)  
Saves cached state from the kernel software VMCS to the user software VMCS.
- void [l4\\_vm\\_vmx\\_ptr\\_load](#) (void \*vmcs, void \*user\_vmcs) [L4\\_NOTHROW](#)  
Loads the user\_vmcs as the current software VMCS.
- [l4\\_uint32\\_t l4\\_vm\\_vmx\\_get\\_cr2\\_index](#) (void const \*vmcs) [L4\\_NOTHROW](#)  
Get the software VMCS field index of the virtual CR2 register.
- [l4\\_umword\\_t l4\\_vm\\_vmx\\_read\\_nat](#) (void \*vmcs, unsigned field) [L4\\_NOTHROW](#)  
Read a natural-width software VMCS field.
- [l4\\_uint16\\_t l4\\_vm\\_vmx\\_read\\_16](#) (void \*vmcs, unsigned field) [L4\\_NOTHROW](#)  
Read a 16-bit software VMCS field.
- [l4\\_uint32\\_t l4\\_vm\\_vmx\\_read\\_32](#) (void \*vmcs, unsigned field) [L4\\_NOTHROW](#)  
Read a 32-bit software VMCS field.
- [l4\\_uint64\\_t l4\\_vm\\_vmx\\_read\\_64](#) (void \*vmcs, unsigned field) [L4\\_NOTHROW](#)  
Read a 64-bit software VMCS field.
- [l4\\_uint64\\_t l4\\_vm\\_vmx\\_read](#) (void \*vmcs, unsigned field) [L4\\_NOTHROW](#)  
Read any software VMCS field.
- void [l4\\_vm\\_vmx\\_write\\_nat](#) (void \*vmcs, unsigned field, [l4\\_umword\\_t](#) val) [L4\\_NOTHROW](#)  
Write to a natural-width software VMCS field.
- void [l4\\_vm\\_vmx\\_write\\_16](#) (void \*vmcs, unsigned field, [l4\\_uint16\\_t](#) val) [L4\\_NOTHROW](#)  
Write to a 16-bit software VMCS field.
- void [l4\\_vm\\_vmx\\_write\\_32](#) (void \*vmcs, unsigned field, [l4\\_uint32\\_t](#) val) [L4\\_NOTHROW](#)  
Write to a 32-bit software VMCS field.
- void [l4\\_vm\\_vmx\\_write\\_64](#) (void \*vmcs, unsigned field, [l4\\_uint64\\_t](#) val) [L4\\_NOTHROW](#)  
Write to a 64-bit software VMCS field.
- void [l4\\_vm\\_vmx\\_write](#) (void \*vmcs, unsigned field, [l4\\_uint64\\_t](#) val) [L4\\_NOTHROW](#)  
Write to an arbitrary software VMCS field.
- void [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs](#) (void \*vmcs, [l4\\_cap\\_idx\\_t](#) vmcs\_cap) [L4\\_NOTHROW](#)  
Associate the software VMCS with a hardware VMCS object capability.
- [l4\\_cap\\_idx\\_t l4\\_vm\\_vmx\\_get\\_hw\\_vmcs](#) (void \*vmcs) [L4\\_NOTHROW](#)  
Get the hardware VMCS object capability associated with the software VMCS.

#### 13.1.11.14.4.1 Detailed Description

Virtual machine API for VMX.

#### 13.1.11.14.4.2 Typedef Documentation

##### **l4\_ext\_vcpu\_state\_vmx\_t**

```
typedef struct l4_ext_vcpu_state_vmx_t l4_ext_vcpu_state_vmx_t
```

VMX extended vCPU state.

For completeness, this is the overall memory layout of the vCPU:

0x000 - 0x1ff: Standard vCPU state [l4\\_vcpu\\_state\\_t](#) (with padding). 0x200 - 0x3ff: VMX capabilities (with padding). 0x400 - 0xffff: VMX extended vCPU state.

The memory layout of the VMX extended vCPU state is as follows:

0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries. 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different VMX extended vCPU state that has been loaded into the given state. 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS. 0x014 - 0x017: Reserved. 0x018 - 0x01f: Capability of the hardware VMCS object (with padding). 0x020 - 0x047: Software VMCS field offset table [l4\\_vmx\\_offset\\_table\\_t](#). 0x048 - 0x0bf: Reserved. 0x0c0 - 0xabf: Software VMCS fields (with padding). 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

##### **l4\_vmx\_offset\_table\_t**

```
typedef struct l4_vmx_offset_table_t l4_vmx_offset_table_t
```

Software VMCS field offset table.

The memory layout is as follows:

0x00 - 0x02: 3 offsets for 16-bit fields. 0x03: Reserved. 0x04 - 0x06: 3 offsets for 64-bit fields. 0x07: Reserved. 0x08 - 0x0a: 3 offsets for 32-bit fields. 0x0b: Reserved. 0x0c - 0x0e: 3 offsets for natural-width fields. 0x0f: Reserved. 0x10 - 0x12: 3 limits for 16-bit fields. 0x13: Reserved. 0x14 - 0x16: 3 limits for 64-bit fields. 0x17: Reserved. 0x18 - 0x1a: 3 limits for 32-bit fields. 0x1b: Reserved. 0x1c - 0x1e: 3 limits for natural-width fields. 0x1f: Reserved. 0x20 - 0x23: 4 index shifts. 0x24: Offset of the first software VMCS field. 0x25: Size of the software VMCS fields. 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.

The offsets (after being multiplied by 64) are indexes in the values array in [l4\\_ext\\_vcpu\\_state\\_vmx\\_t](#) and bit indexes in the dirty\_bitmap array in [l4\\_ext\\_vcpu\\_state\\_vmx\\_t](#).

The limits (after being multiplied by 64) represent the range of the available indexes.

### 13.1.11.14.4.3 Enumeration Type Documentation

#### L4\_vm\_vmx\_caps\_regs

enum [L4\\_vm\\_vmx\\_caps\\_regs](#)

Exported VMX capability registers.

##### Enumerator

L4_VM_VMX_BASIC_REG	Basic VMX capabilities.
L4_VM_VMX_TRUE_PINBASED_CTLN_REG	True pin-based control caps.
L4_VM_VMX_TRUE_PROCBASED_CTLN_REG	True processor based control caps.
L4_VM_VMX_TRUE_EXIT_CTLN_REG	True exit control caps.
L4_VM_VMX_TRUE_ENTRY_CTLN_REG	True entry control caps.
L4_VM_VMX_MISC_REG	Misc caps.
L4_VM_VMX_CR0_FIXED0_REG	Fixed to 0 bits of CR0.
L4_VM_VMX_CR0_FIXED1_REG	Fixed to 1 bits of CR0.
L4_VM_VMX_CR4_FIXED0_REG	Fixed to 0 bits of CR4.
L4_VM_VMX_CR4_FIXED1_REG	Fixed to 1 bits of CR4.
L4_VM_VMX_VMCS_ENUM_REG	VMCS enumeration info.
L4_VM_VMX_PROCBASED_CTLN2_REG	Processor based control 2 caps.
L4_VM_VMX_EPT_VPID_CAP_REG	EPT and VPID caps.
L4_VM_VMX_NESTED_REVISION	Nested VMCS revision.
L4_VM_VMX_NUM_CAPS_REGS	Total number of VMX capability registers.

Definition at line 39 of file [\\_\\_vm-vmx.h](#).

#### L4\_vm\_vmx\_dfl1\_regs

enum [L4\\_vm\\_vmx\\_dfl1\\_regs](#)

Exported VMX capability registers (default to 1 bits).

##### Enumerator

L4_VM_VMX_PINBASED_CTLN_DFL1_REG	Default 1 bits in pin-based controls.
L4_VM_VMX_PROCBASED_CTLN_DFL1_REG	Default 1 bits in processor-based controls.
L4_VM_VMX_EXIT_CTLN_DFL1_REG	Default 1 bits in exit controls.
L4_VM_VMX_ENTRY_CTLN_DFL1_REG	Default 1 bits in entry controls.
L4_VM_VMX_NUM_DFL1_REGS	Total number of default on registers.

Definition at line 63 of file [\\_\\_vm-vmx.h](#).

#### L4\_vm\_vmx\_sw\_fields

enum [L4\\_vm\\_vmx\\_sw\\_fields](#)

Additional (virtual) VMCS fields.

The VMCS offsets defined here are actually not in the hardware VMCS. However our VMMs run in user mode and need to have access to certain registers available in kernel mode only. So we put them into our version of the VMCS.

#### Enumerator

L4_VM_VMX_VMCS_CR2	VMCS offset for CR2.  <b>Note</b>  You usually need to check this value against the value you get from <a href="#">l4_vm_vmx_get_cr2_index()</a> to make sure you are running on a compatible kernel.
L4_VM_VMX_VMCS_XCR0	VMCS offset of extended control register XCR0.
L4_VM_VMX_VMCS_MSR_SYSCALL_MASK	VMCS offset of system call flag mask MSR.
L4_VM_VMX_VMCS_MSR_LSTAR	VMCS offset of IA32e mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_CSTAR	VMCS offset of IA32 mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_TSC_AUX	VMCS offset of auxiliary TSC signature MSR.
L4_VM_VMX_VMCS_MSR_STAR	VMCS offset of system call target address MSR.
L4_VM_VMX_VMCS_MSR_KERNEL_GS_BASE	VMCS offset of GS base address swap target MSR.

Definition at line 106 of file [\\_\\_vm-vmx.h](#).

#### 13.1.11.14.4.4 Function Documentation

##### **l4\_vm\_vmx\_clear()**

```
void l4_vm_vmx_clear (
    void * vmcs,
    void * user_vmcs ) [inline]
```

Saves cached state from the kernel software VMCS to the user software VMCS.

#### Parameters

<i>vmcs</i>	Pointer to the kernel software VMCS.
<i>user_vmcs</i>	Pointer to the user software VMCS.

This function is comparable to VMX vmclear.

Definition at line 623 of file [\\_\\_vm-vmx.h](#).

References [l4\\_vm\\_vmx\\_get\\_hw\\_vmcs\(\)](#), and [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs\(\)](#).

Referenced by [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### `l4_vm_vmx_field_len()`

```
unsigned l4_vm_vmx_field_len (  
    unsigned field ) [inline]
```

Return length in bytes of a VMCS field.

#### Parameters

<i>field</i>	Field number.
--------------	---------------

#### Returns

Width of field in bytes.

Definition at line 535 of file `__vm-vmx.h`.

References `l4_vm_vmx_field_order()`.

Here is the call graph for this function:

### **`l4_vm_vmx_field_order()`**

```
unsigned l4_vm_vmx_field_order (
    unsigned field ) [inline]
```

Return length in power of two (bytes) of a VMCS field.

#### **Parameters**

<i>field</i>	Field number.
--------------	---------------

#### **Returns**

Width of field in power of two (bytes).

Definition at line 518 of file `__vm-vmx.h`.

Referenced by `l4_vm_vmx_field_len()`.

Here is the caller graph for this function:

### **`l4_vm_vmx_get_caps()`**

```
l4_uint64_t l4_vm_vmx_get_caps (
    void const * vcpu_state,
    unsigned cap_msr ) [inline]
```

Get a capability register for VMX.

**Parameters**

<i>vcpu_state</i>	Pointer to the VCPU state of the VCPU.
<i>cap_msr</i>	Caps register index (see <a href="#">L4_vm_vmx_caps_regs</a> ).

**Returns**

The value of the capability register.

Definition at line 805 of file [\\_\\_vm-vmx.h](#).

References [L4\\_VCPU\\_OFFSET\\_EXT\\_INFOS](#).

**`l4_vm_vmx_get_caps_default1()`**

```
l4_uint32_t l4_vm_vmx_get_caps_default1 (  
    void const * vcpu_state,  
    unsigned cap_msr ) [inline]
```

Get a default to one capability register for VMX.

**Parameters**

<i>vcpu_state</i>	Pointer to the VCPU state of the VCPU.
<i>cap_msr</i>	Default 1 caps register index (see <a href="#">L4_vm_vmx_dfl1_regs</a> ).

**Returns**

The value of the capability register.

Definition at line 813 of file [\\_\\_vm-vmx.h](#).

References [L4\\_VCPU\\_OFFSET\\_EXT\\_INFOS](#), [L4\\_VM\\_VMX\\_NUM\\_CAPS\\_REGS](#), and [L4\\_VM\\_VMX\\_PINBASED\\_CTL5\\_DFL1\\_REGS](#).

**`l4_vm_vmx_get_cr2_index()`**

```
l4_uint32_t l4_vm_vmx_get_cr2_index (  
    void const * vmcs ) [inline]
```

Get the software VMCS field index of the virtual CR2 register.

**Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
-------------	-------------------------------

**Returns**

The field index used for the virtual CR2 register as used by the current Fiasco.OC interface.

The CR2 register is actually not in the hardware VMCS, however our VMMs run in user mode and need to have access to this register so we put it into our software version of the VMCS.

### **l4\_vm\_vmx\_get\_hw\_vmcs()**

```
l4_cap_idx_t l4_vm_vmx_get_hw_vmcs (
    void * vmcs ) [inline]
```

Get the hardware VMCS object capability associated with the software VMCS.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
-------------	-------------------------------

#### **Returns**

Hardware VMCS object capability.

Definition at line 837 of file [\\_\\_vm-vmx.h](#).

References [L4\\_CAP\\_MASK](#).

Referenced by [l4\\_vm\\_vmx\\_clear\(\)](#), and [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

Here is the caller graph for this function:

### **l4\_vm\_vmx\_ptr\_load()**

```
void l4_vm_vmx_ptr_load (
    void * vmcs,
    void * user_vmcs ) [inline]
```

Loads the `user_vmcs` as the current software VMCS.

## Parameters

<i>vmcs</i>	Pointer to the kernel software VMCS.
<i>user_vmcs</i>	Pointer to the user software VMCS.

This function is comparable to VMX `vmprld`.

Definition at line 644 of file `__vm-vmx.h`.

References `l4_vm_vmx_clear()`, `l4_vm_vmx_get_hw_vmcs()`, and `l4_vm_vmx_set_hw_vmcs()`.

Here is the call graph for this function:

**`l4_vm_vmx_read()`**

```

l4_uint64_t l4_vm_vmx_read (
    void * vmcs,
    unsigned field ) [inline]
  
```

Read any software VMCS field.

## Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

## Returns

The value of the software VMCS field with the given index.

Definition at line 713 of file `__vm-vmx.h`.

References `l4_vm_vmx_read_16()`, `l4_vm_vmx_read_32()`, `l4_vm_vmx_read_64()`, and `l4_vm_vmx_read_nat()`.

Here is the call graph for this function:

### **l4\_vm\_vmx\_read\_16()**

```

l4_uint16_t l4_vm_vmx_read_16 (
    void * vmcs,
    unsigned field ) [inline]
  
```

Read a 16-bit software VMCS field.

#### Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

#### Returns

The value of the software VMCS field with the given index.

Definition at line 680 of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

### **l4\_vm\_vmx\_read\_32()**

```
l4_uint32_t l4_vm_vmx_read_32 (
    void * vmcs,
    unsigned field ) [inline]
```

Read a 32-bit software VMCS field.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

#### **Returns**

The value of the software VMCS field with the given index.

Definition at line 691 of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

### **l4\_vm\_vmx\_read\_64()**

```
l4_uint64_t l4_vm_vmx_read_64 (
    void * vmcs,
    unsigned field ) [inline]
```

Read a 64-bit software VMCS field.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

#### **Returns**

The value of the software VMCS field with the given index.

Definition at line 702 of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

### **`l4_vm_vmx_read_nat()`**

```
l4_umword_t l4_vm_vmx_read_nat (
    void * vmcs,
    unsigned field ) [inline]
```

Read a natural-width software VMCS field.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

#### **Returns**

The value of the software VMCS field with the given index.

Definition at line [669](#) of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

## l4\_vm\_vmx\_set\_hw\_vmcs()

```
void l4_vm_vmx_set_hw_vmcs (
    void * vmcs,
    l4_cap_idx_t vmcs_cap ) [inline]
```

Associate the software VMCS with a hardware VMCS object capability.

The VMX extended vCPU is unable to run unless it is associated with a hardware VMCS object (i.e. a Vcpu\_context object).

### Note

When replacing the hardware VMCS object, the dirty bitmap of the software VMCS fields is not touched. This is on purpose, to enable efficient switching between separate VMs. The user is responsible for explicitly setting those software VMCS bitmap fields that need to be synchronized to the hardware VMCS.

The kernel might cache the VMCS object internally (i.e. the capability is not looked up on every vCPU resume). To remove the association of the current hardware VMCS object, store an invalid capability with the bit 3 set.

If the hardware limitations of the usage of the hardware VMCS are not observed (i.e. no hardware VMCS being active on more than one physical CPU), the vCPU will fail to resume.

### Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>vmcs_cap</i>	Hardware VMCS object capability.

Definition at line 829 of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_clear\(\)](#), and [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

Here is the caller graph for this function:

## l4\_vm\_vmx\_write()

```
void l4_vm_vmx_write (
    void * vmcs,
    unsigned field,
    l4_uint64_t val ) [inline]
```

Write to an arbitrary software VMCS field.

## Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.
<i>val</i>	The value that shall be written to the given field.

Definition at line 790 of file [\\_\\_vm-vmx.h](#).

References [l4\\_vm\\_vmx\\_write\\_16\(\)](#), [l4\\_vm\\_vmx\\_write\\_32\(\)](#), [l4\\_vm\\_vmx\\_write\\_64\(\)](#), and [l4\\_vm\\_vmx\\_write\\_nat\(\)](#).

Here is the call graph for this function:

**`l4_vm_vmx_write_16()`**

```
void l4_vm_vmx_write_16 (
    void * vmcs,
    unsigned field,
    l4_uint16_t val ) [inline]
```

Write to a 16-bit software VMCS field.

## Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.
<i>val</i>	The value that shall be written to the given field.

Definition at line 745 of file [\\_\\_vm-vmx.h](#).

Referenced by [l4\\_vm\\_vmx\\_write\(\)](#).

Here is the caller graph for this function:

### **`l4_vm_vmx_write_32()`**

```
void l4_vm_vmx_write_32 (
    void * vmcs,
    unsigned field,
    l4_uint32_t val ) [inline]
```

Write to a 32-bit software VMCS field.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.
<i>val</i>	The value that shall be written to the given field.

Definition at line 760 of file [\\_\\_vm-vmx.h](#).

### 13.1.12 Memory operations.

Operations for memory access.

Collaboration diagram for Memory operations.:

#### Enumerations

- enum `L4_mem_op_widths` { `L4_MEM_WIDTH_1BYTE` = 0 , `L4_MEM_WIDTH_2BYTE` = 1 , `L4_MEM_WIDTH_4BYTE` = 2 }

*Memory access width definitions.*

#### Functions

- unsigned long `l4_mem_read` (unsigned long virtaddress, unsigned width)  
*Read user task memory from kernel privilege level.*
- void `l4_mem_write` (unsigned long virtaddress, unsigned width, unsigned long value)  
*Write user task memory from kernel privilege level.*

#### 13.1.12.1 Detailed Description

Operations for memory access.

This module provides functionality to access user task memory from the kernel. This is needed for some devices that are only accessible from privileged processor mode. Only use this when absolutely required. This functionality is only available on the ARM architecture.

```
#include <l4/sys/mem_op.h>
```

#### 13.1.12.2 Enumeration Type Documentation

##### 13.1.12.2.1 L4\_mem\_op\_widths

```
enum L4_mem_op_widths
```

Memory access width definitions.

#### Enumerator

<code>L4_MEM_WIDTH_1BYTE</code>	Access one byte (8-bit width)
<code>L4_MEM_WIDTH_2BYTE</code>	Access two bytes (16-bit width)
<code>L4_MEM_WIDTH_4BYTE</code>	Access four bytes (32-bit width)

Definition at line 51 of file [mem\\_op.h](#).

### 13.1.12.3 Function Documentation

#### 13.1.12.3.1 l4\_mem\_read()

```
unsigned long l4_mem_read (
    unsigned long virtaddress,
    unsigned width ) [inline]
```

Read user task memory from kernel privilege level.

##### Parameters

<i>virtaddress</i>	Virtual address in the calling task.
<i>width</i>	Width of access in bytes in log2,

##### See also

[L4\\_mem\\_op\\_widths](#)

##### Returns

Read value.

Upon an given invalid address or invalid width value the function does nothing.

Definition at line 141 of file [mem\\_op.h](#).

References [l4\\_mem\\_arm\\_op\\_call\(\)](#).

Here is the call graph for this function:

#### 13.1.12.3.2 l4\_mem\_write()

```
void l4_mem_write (
    unsigned long virtaddress,
    unsigned width,
    unsigned long value ) [inline]
```

Write user task memory from kernel privilege level.

## Parameters

<i>virtaddress</i>	Virtual address in the calling task.
<i>width</i>	Width of access in bytes in log2 (i.e. allowed values: 0, 1, 2)
<i>value</i>	Value to write.

Upon an given invalid address or invalid width value the function does nothing.

Definition at line 147 of file [mem\\_op.h](#).

References [l4\\_mem\\_arm\\_op\\_call\(\)](#).

Here is the call graph for this function:

### 13.1.13 Memory related

Memory related constants, data types and functions.

Collaboration diagram for Memory related:

#### 13.1.13.2.9 L4\_SUPERPAGESIZE

```
#define L4_SUPERPAGESIZE
```

Size of a large page.

A large page is a *super page* on IA32 or a *section* on ARM.

Definition at line 407 of file [consts.h](#).

### 13.1.13.3 Enumeration Type Documentation

#### 13.1.13.3.1 l4\_addr\_consts\_t

```
enum l4_addr_consts_t
```

Address related constants.

## Enumerator

L4_INVALID_ADDR	Invalid address.
-----------------	------------------

Definition at line 492 of file [consts.h](#).

## 13.1.13.4 Function Documentation

## 13.1.13.4.1 l4\_bytes\_to\_mwords()

```
unsigned l4_bytes_to_mwords (
    unsigned size ) [inline]
```

Determine how many machine words (l4\_umword\_t) are required to store a buffer of 'size' bytes.

## Parameters

size	The number of bytes to be translated into machine words.
------	--

Definition at line 485 of file [consts.h](#).

Referenced by [\\_\\_kdebug\\_3\\_text\(\)](#), [\\_\\_kdebug\\_text\(\)](#), and [l4\\_vcon\\_send\\_u\(\)](#).

Here is the caller graph for this function:

## 13.1.13.4.2 l4\_round\_page()

```
l4_addr_t l4_round_page (
    l4_addr_t address ) [inline]
```

Round address up to the next page.

The address is rounded up to the next minimal page boundary. On most architectures this is a 4k page. Check [L4\\_PAGESIZE](#) for the minimal page size.

## Parameters

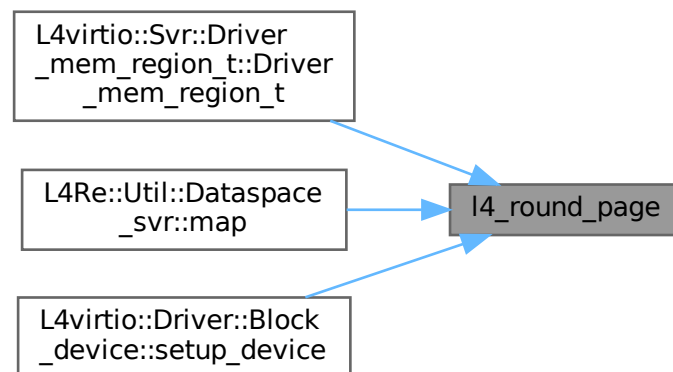

<i>address</i>	The address to round up.
----------------	--------------------------

Definition at line 462 of file [consts.h](#).

References [L4\\_PAGEMASK](#), and [L4\\_PAGESIZE](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< DATA >::Driver\\_mem\\_region\\_t\(\)](#), [L4Re::Util::Dataspace\\_svr::map\(\)](#), and [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#).

Here is the caller graph for this function:

#### 13.1.13.4.3 l4\_round\_size()

```
l4_addr_t l4_round_size (
    l4_addr_t value,
    unsigned char bits ) [inline]
```

Round value up to the next alignment with *bits* size.

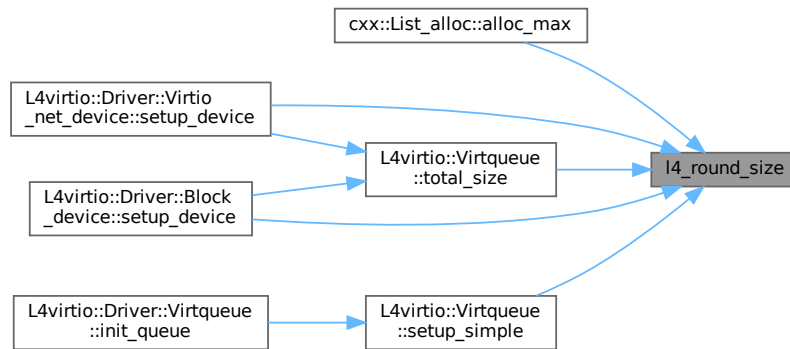

## Parameters

<i>value</i>	The value to round up to the next size-alignment.
<i>bits</i>	The size of the alignment (log2).

Definition at line 473 of file [consts.h](#).

Referenced by [cxx::List\\_alloc::alloc\\_max\(\)](#), [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#), [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), [L4virtio::Virtqueue::setup\\_simple\(\)](#), and [L4virtio::Virtqueue::total\\_size\(\)](#).

Here is the caller graph for this function:

#### 13.1.13.4.4 l4\_trunc\_page()

```
l4_addr_t l4_trunc_page (
    l4_addr_t address ) [inline]
```

Round an address down to the next lower page boundary.

The address is rounded down to the next lower minimal page boundary. On most architectures this is a 4k page. Check [L4\\_PAGESIZE](#) for the minimal page size.

##### Parameters

<i>address</i>	The address to round.
----------------	-----------------------

##### Examples

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), and [examples/libs/l4re/c/ma+rm.c](#).

Definition at line [437](#) of file [consts.h](#).

References [L4\\_PAGEMASK](#).

Referenced by [l4\\_touch\\_ro\(\)](#), [l4\\_touch\\_rw\(\)](#), and [L4Re::Util::Dataspace\\_svr::map\(\)](#).

Here is the caller graph for this function:

#### 13.1.13.4.5 l4\_trunc\_size()

```
l4_addr_t l4_trunc_size (
    l4_addr_t address,
    unsigned char bits ) [inline]
```

Round an address down to the next lower flex page with size *bits*.

##### Parameters

<i>address</i>	The address to round.
<i>bits</i>	The size of the flex page (log2).

Definition at line 448 of file [consts.h](#).

Referenced by [cxx::List\\_alloc::alloc\\_max\(\)](#), [l4\\_fpage\\_max\\_order\(\)](#), and [L4Re::Util::Dataspace\\_svr::map\(\)](#).

Here is the caller graph for this function:

### 13.1.14 Object Invocation

API for [L4](#) object invocation.

[L4\\_SYSF\\_REPLY\\_AND\\_WAIT](#) }  
*Capability selector flags.*

## Functions

- `l4_msgtag_t l4_ipc_send (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW`  
*Send a message to an object (do **not** wait for a reply).*
- `l4_msgtag_t l4_ipc_wait (l4_utcb_t *utcb, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW`  
*Wait for an incoming message from any possible sender.*
- `l4_msgtag_t l4_ipc_receive (l4_cap_idx_t object, l4_utcb_t *utcb, l4_timeout_t timeout) L4_NOTHROW`  
*Wait for a message from a specific source.*
- `l4_msgtag_t l4_ipc_call (l4_cap_idx_t object, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW`  
*Object call (usual invocation).*
- `l4_msgtag_t l4_ipc_reply_and_wait (l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW`  
*Reply and wait operation (uses the reply capability).*
- `l4_msgtag_t l4_ipc_send_and_wait (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW`  
*Send a message and do an open wait.*
- `l4_msgtag_t l4_ipc (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_umword_t flags, l4_umword_t slabel, l4_msgtag_t tag, l4_umword_t *rlabel, l4_timeout_t timeout) L4_NOTHROW`  
*Generic L4 object invocation.*
- `l4_msgtag_t l4_ipc_sleep (l4_timeout_t timeout) L4_NOTHROW`  
*Sleep for an amount of time.*
- `l4_msgtag_t l4_ipc_sleep_ms (l4_uint32_t ms) L4_NOTHROW`  
*Sleep for a certain amount of milliseconds.*
- `l4_msgtag_t l4_ipc_sleep_us (l4_uint64_t us) L4_NOTHROW`  
*Sleep for a certain amount of microseconds.*
- `int l4_sndfpage_add (l4_fpage_t const snd_fpage, unsigned long snd_base, l4_msgtag_t *tag) L4_NOTHROW`  
*Add a flex-page to be sent to the UTCB.*

### 13.1.14.1 Detailed Description

API for L4 object invocation.

#### Include File

```
#include <l4/sys/ipc.h>
```

General abstractions for L4 object invocation. The basic principle is that all objects are denoted by a capability that is accessed via a capability selector (see [Capabilities](#)).

This set of functions is common to all kinds of objects provided by the L4 micro kernel. The concrete semantics of an invocation depends on the object that shall be invoked.

Objects may be invoked in various ways, the most common way is to use a *call* operation (`l4_ipc_call()`). However, there are a lot more flavours available that have a semantics depending on the object.

#### See also

[IPC-Gate API](#)

[L4 Inter-Process Communication \(IPC\)](#)

### 13.1.14.2 Timeouts during IPC

IPC operation between two communication partners may consist of up to two phases (send phase and receive phase). For both phases, a timeout may be specified (send timeout and receive timeout).

#### Note

When IPC communication happens across CPU cores and a timeout is specified, then the counting of the timeout only begins after the target thread has been scheduled at least once. In particular, this means that an IPC timeout, including a timeout of zero, may be delayed depending on the scheduling on the target CPU core. If a higher priority thread on the target core is executing a busy loop, that delay may even be indefinitely.

#### See also

[Timeouts](#)

### 13.1.14.3 Enumeration Type Documentation

#### 13.1.14.3.1 l4\_syscall\_flags\_t

```
enum l4_syscall_flags_t
```

Capability selector flags.

These flags determine the concrete operation when a kernel object is invoked.

The following combinations of flags are supported when invoking IPC (see [l4\\_ipc\(\)](#)); with other combinations, behavior is undefined:

- [L4\\_SYSF\\_SEND](#): send to specified partner
- [L4\\_SYSF\\_RECV](#): receive from specified partner
- [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): receive from any sending partner; see [L4\\_SYSF\\_WAIT](#)
- [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#): call specified partner; see [L4\\_SYSF\\_CALL](#)
- [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): send to specified partner and receive from any sending partner; see [L4\\_SYSF\\_SEND\\_AND\\_WAIT](#)
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#): reply to caller
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#): call the caller
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): reply to caller and receive from any sending partner; see [L4\\_SYSF\\_REPLY\\_AND\\_WAIT](#)

#### Enumerator

L4_SYSF_NONE	<p>Empty set of flags.</p> <p><b>Deprecated</b> Default flags (call to a kernel object).</p> <p>Using this value as flags in the capability selector for an invocation indicates a call (send and wait for a reply).</p>
--------------	--

## Enumerator

L4_SYSF_SEND	Send-phase flag. Setting this flag in a capability selector induces a send phase, this means a message is sent to the object denoted by the capability. For receive phase see <a href="#">L4_SYSF_RECV</a> . In <a href="#">l4_vcpu_state_t::user_task</a> this flag means that the kernel has cached the user task capability internally, see <a href="#">l4_thread_vcpu_resume_commit()</a> .
L4_SYSF_RECV	Receive-phase flag. Setting this flag in a capability selector induces a receive phase, this means the invoking thread waits for a message from the object denoted by the capability. For a send phase see <a href="#">L4_SYSF_SEND</a> .
L4_SYSF_OPEN_WAIT	Open-wait flag. This flag indicates that the receive operation (see <a href="#">L4_SYSF_RECV</a> ) shall be an <i>open wait</i> . <i>Open wait</i> means that the invoking thread shall wait for a message from any possible sender and <i>not</i> from the sender denoted by the capability.
L4_SYSF_REPLY	Reply flag. This flag indicates that the send phase shall use the in-kernel reply capability instead of the capability denoted by the selector index.
L4_SYSF_CALL	Call flags (combines send and receive). Combines <a href="#">L4_SYSF_SEND</a> and <a href="#">L4_SYSF_RECV</a> .
L4_SYSF_WAIT	Wait flags (combines receive and open wait). Combines <a href="#">L4_SYSF_RECV</a> and <a href="#">L4_SYSF_OPEN_WAIT</a> .
L4_SYSF_SEND_AND_WAIT	Send-and-wait flags. Combines <a href="#">L4_SYSF_SEND</a> and <a href="#">L4_SYSF_WAIT</a> .
L4_SYSF_REPLY_AND_WAIT	Reply-and-wait flags. Combines <a href="#">L4_SYSF_SEND</a> , <a href="#">L4_SYSF_REPLY</a> , and <a href="#">L4_SYSF_WAIT</a> .

Definition at line 61 of file [consts.h](#).

## 13.1.14.4 Function Documentation

## 13.1.14.4.1 l4\_ipc()

```
l4_msgtag_t l4_ipc (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_umword_t flags,
    l4_umword_t slabel,
    l4_msgtag_t tag,
    l4_umword_t * rlabel,
    l4_timeout_t timeout ) [inline]
```

Generic [L4](#) object invocation.

## Parameters

	<i>dest</i>	Destination object. <a href="#">L4_INVALID_CAP</a> denotes the current thread. An IPC to the current thread will always abort after the specified timeout and can be used for sleeping without busy waiting.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>flags</i>	Invocation flags (see <a href="#">l4_syscall_flags_t</a> ).
	<i>slabel</i>	Send label if applicable (may be seen by the receiver).
	<i>tag</i>	Sending message tag.
out	<i>rlabel</i>	Receiving label.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

**Returns**

return tag

**See also**

[L4 Inter-Process Communication \(IPC\)](#)

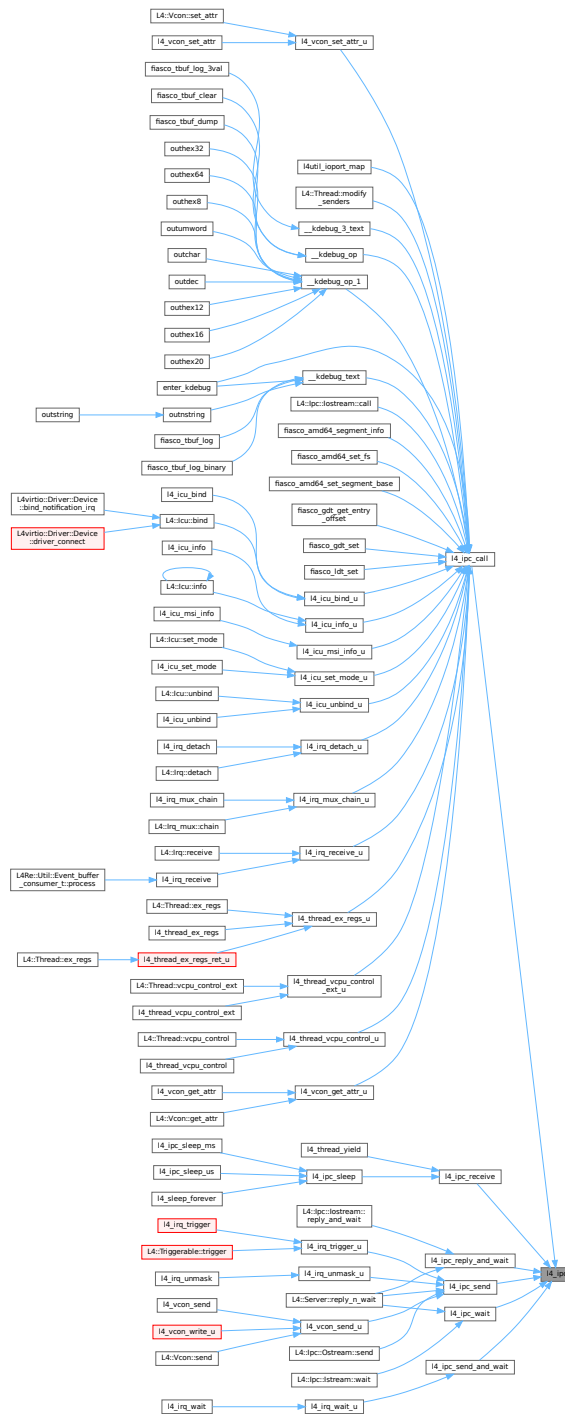

Definition at line 34 of file [ipc.h](#).

References [l4\\_msgtag\\_t::raw](#).

Referenced by [l4\\_ipc\\_call\(\)](#), [l4\\_ipc\\_receive\(\)](#), [l4\\_ipc\\_reply\\_and\\_wait\(\)](#), [l4\\_ipc\\_send\(\)](#), [l4\\_ipc\\_send\\_and\\_wait\(\)](#), and [l4\\_ipc\\_wait\(\)](#).

Here is the caller graph for this function:

#### 13.1.14.4.2 l4\_ipc\_call()

```
l4_msgtag_t l4_ipc_call (
    l4_cap_idx_t object,
    l4_utcb_t * utcb,
```

```
l4_msgtag_t tag,
l4_timeout_t timeout ) [inline]
```

Object call (usual invocation).

#### Parameters

<i>object</i>	Capability selector for the object to call. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and will abort the IPC after the time specified in the <code>snd</code> part of the <code>timeout</code> parameter has expired.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>tag</i>	Message tag to describe the message to be sent.
<i>timeout</i>	Timeout pair for send an receive phase (see <a href="#">l4_timeout_t</a> ).

#### Returns

result tag

A message is sent to the object and the invoker waits for a reply from the object. Messages from other sources are not accepted.

#### Note

The send-to-receive transition needs no time, the object can reply with a send timeout of zero.

If a finite receive timeout is specified, the IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.14.4.3 l4\_ipc\_receive()

```
14_msgtag_t 14_ipc_receive (
    14_cap_idx_t object,
    14_utcb_t * utcb,
    14_timeout_t timeout ) [inline]
```

Wait for a message from a specific source.

## Parameters

<i>object</i>	Object to receive a message from. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread. It could be used for sleeping without busy waiting for the time specified in the <code>rcv</code> part of the <code>timeout</code> parameter.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> , only the receive part matters).

## Returns

result tag.

This operation waits for a message from the specified object. Messages from other sources are not accepted by this operation. The operation does not include a send phase, this means no message is sent to the object.

## Note

This operation is usually used to receive messages from a specific IRQ or thread. However, it is not common to use this operation for normal applications.

## See also

[L4 Inter-Process Communication \(IPC\)](#)

## Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

References [l4\\_ipc\(\)](#), [L4\\_SYSF\\_RECV](#), and [l4\\_msgtag\\_t::raw](#).

Referenced by [l4\\_ipc\\_sleep\(\)](#), and [l4\\_thread\\_yield\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.14.4.4 l4\_ipc\_reply\_and\_wait()

```
l4_msgtag_t l4_ipc_reply_and_wait (
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_umword_t * label,
    l4_timeout_t timeout ) [inline]
```

Reply and wait operation (uses the *reply* capability).

##### Parameters

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>tag</i>	Describes the message to be sent as reply.
out	<i>label</i>	Label assigned to the source object of the received message.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

##### Returns

result tag

A message is sent to the previous caller using the implicit reply capability. Afterwards the invoking thread waits for a message from any source.

##### Note

This is the standard server operation: it sends a reply to the actual client and waits for the next incoming request, which may come from any other client.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

##### See also

[L4 Inter-Process Communication \(IPC\)](#)

##### Examples

[examples/sys/ipc/ipc\\_example.c](#).

Definition at line 583 of file [ipc.h](#).

References [L4\\_INVALID\\_CAP](#), [l4\\_ipc\(\)](#), and [L4\\_SYSF\\_REPLY\\_AND\\_WAIT](#).

Referenced by [L4::ipc::loststream::reply\\_and\\_wait\(\)](#), and [L4::Server< LOOP\\_HOOKS >::reply\\_n\\_wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.14.4.5 l4\_ipc\_send()

```

l4_msgtag_t l4_ipc_send (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_timeout_t timeout ) [inline]
  
```

Send a message to an object (do **not** wait for a reply).

##### Parameters

<i>dest</i>	Capability selector for the destination object. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and could be used for sleeping without busy waiting for the time specified in the <code>snd</code> part of the <code>timeout</code> parameter.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>tag</i>	Descriptor for the message to be sent.
<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ) only send part is relevant.

##### Returns

Syscall return tag for the send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

A message is sent to the destination object. There is no receive phase included. The invoker continues working after sending the message.

##### Note

This is a special-purpose message transfer. Objects usually support only invocation via [l4\\_ipc\\_call\(\)](#) consisting of a send phase and a receive phase for returning the result of the object invocation. For example, [l4\\_icu\\_unmask\(\)](#), [l4\\_icu\\_mask\(\)](#) and [l4\\_irq\\_trigger\(\)](#) use send-only IPC operations for object invocation.

Here is the caller graph for this function:

#### 13.1.14.4.6 l4\_ipc\_send\_and\_wait()

```

l4_msgtag_t l4_ipc_send_and_wait (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_umword_t * label,
    l4_timeout_t timeout ) [inline]
  
```

Send a message and do an open wait.

## Parameters

	<i>dest</i>	Object to send a message to. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and will abort the IPC after the time specified in the <code>snd</code> part of the <code>timeout</code> parameter has expired.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>tag</i>	Describes the message that shall be sent.
out	<i>label</i>	Label assigned to the source object of the receive phase.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

## Returns

result tag

A message is sent to the destination object and the invoking thread waits for a reply from any source.

## Note

This is a special-purpose operation and shall not be used in general applications.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

    l4_utcb_t * utcb,
    l4_umword_t * label,
    l4_timeout_t timeout ) [inline]
  
```

Wait for an incoming message from any possible sender.

**Parameters**

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
out	<i>label</i>	Label assigned to the source object (IPC gate or IRQ).
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> , only the receive part is used).

**Returns**

return tag

This operation does an open wait, and therefore needs no capability to denote the possible source of a message. This means the calling thread waits for an incoming message from any possible source. There is no send phase included in this operation.

The usual usage of this function is to call that function when entering a server loop in a user-level server that implements user-level objects, see also [l4\\_ipc\\_reply\\_and\\_wait\(\)](#).

#### Note

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

```

int l4_sndfpage_add (
    l4_fpage_t const snd_fpage,
    unsigned long snd_base,
    l4_msgtag_t * tag ) [inline]
  
```

Add a flex-page to be sent to the UTCB.

## Parameters

	<i>snd_fpage</i>	Flex-page.
	<i>snd_base</i>	Send base.
<i>in, out</i>	<i>tag</i>	Tag to be updated. Only the number of items is incremented in the updated tag, all other members remain unmodified.

## Returns

0 on success, negative error code otherwise

Error codes in the error TCR.

## Functions

- `l4_umword_t l4_ipc_error (l4_msgtag_t tag, l4_utcb_t *utcb) L4_NOTHROW`  
Get the IPC error code for an IPC operation.
- long `l4_error (l4_msgtag_t tag) L4_NOTHROW`  
Get IPC error code if any or message tag label otherwise for an IPC call.
- int `l4_ipc_is_snd_error (l4_utcb_t *utcb) L4_NOTHROW`  
Returns whether an error occurred in send phase of an invocation.
- int `l4_ipc_is_rcv_error (l4_utcb_t *utcb) L4_NOTHROW`  
Returns whether an error occurred in receive phase of an invocation.
- int `l4_ipc_error_code (l4_utcb_t *utcb) L4_NOTHROW`  
Get the error condition of the last invocation from the TCR.

### 13.1.14.5.1 Detailed Description

Error handling for L4 object invocation.

#### Include File

```
#include <l4/sys/ipc.h>
```

### 13.1.14.5.2 Enumeration Type Documentation

#### 13.1.14.5.2.1 l4\_ipc\_tcr\_error\_t

```
enum l4_ipc_tcr_error_t
```

Error codes in the *error* TCR.

The error codes are accessible via the *error* TCR, see `l4_thread_regs_t.error`.

#### Enumerator

<code>L4_IPC_ERROR_MASK</code>	Mask for error bits.
<code>L4_IPC_SND_ERR_MASK</code>	Send error mask.
<code>L4_IPC_ENOT_EXISTENT</code>	Non-existing destination or source.
<code>L4_IPC_RETIMEOUT</code>	Timeout during receive operation.

## Enumerator

L4_IPC_SETIMEOUT	Timeout during send operation.
L4_IPC_RECANCELED	Receive operation canceled.
L4_IPC_SECANCELED	Send operation canceled.
L4_IPC_REMAPFAILED	Map flexpage failed in receive operation.
L4_IPC_SEMAPFAILED	Map flexpage failed in send operation.
L4_IPC_RESNDPFTO	Send-pagefault timeout in receive operation.
L4_IPC_SESNDPFTO	Send-pagefault timeout in send operation.
L4_IPC_RERCVPFTO	Receive-pagefault timeout in receive operation.
L4_IPC_SERCVPFTO	Receive-pagefault timeout in send operation.
L4_IPC_REABORTED	Receive operation aborted.
L4_IPC_SEABORTED	Send operation aborted.
L4_IPC_REMSGCUT	Received message truncated. Usually returned when the typed items to be sent by the IPC partner exceed the buffer registers of the respective types.
L4_IPC_SEMSGCUT	Sent message truncated. Usually returned when the typed items to be sent exceed the IPC partner's buffer registers of the respective types.

Definition at line 92 of file [ipc.h](#).

### 13.1.14.5.3 Function Documentation

#### 13.1.14.5.3.1 l4\_error()

```
long l4_error (
    l4_msgtag_t tag ) [inline]
```

Get IPC error code if any or message tag label otherwise for an IPC call.

This function shall only be used if the IPC operation includes a receive phase (usually a call operation), otherwise no tag label is received and the return value of this function is undefined.

## Parameters

<i>tag</i>	Message tag returned by the IPC call.
------------	---------------------------------------

## Returns

In case of an IPC error, a negative error code in the range of [L4\\_EIPC\\_LO](#) to [L4\\_EIPC\\_HI](#) (see [l4\\_ipc\\_to\\_errno\(\)](#) and [l4\\_ipc\\_tcr\\_error\\_t](#)), otherwise the tag label. By convention, the callee can signal errors via a negative tag label (negated value from [l4\\_error\\_code\\_t](#)) and success via a non-negative value.

## Examples

[examples/libs/l4re/streammap/client.cc](#), [examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/migrate/thread\\_migration.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

### 13.1.14.5.3.3 l4\_ipc\_error\_code()

```
int l4_ipc_error_code (
    l4_utcb_t * utcb ) [inline]
```

Get the error condition of the last invocation from the TCR.

## Precondition

`l4_msgtag_has_error(tag) == true`

**Parameters**

<i>utcb</i>	UTCB to check.
-------------	----------------

**Returns**

Error condition of type `l4_ipc_tcr_error_t`.

Definition at line 669 of file `ipc.h`.

References `l4_thread_regs_t::error`, and `L4_IPC_ERROR_MASK`.

**13.1.14.5.3.4 l4\_ipc\_is\_rcv\_error()**

```
int l4_ipc_is_rcv_error (  
    l4_utcb_t * utcb ) [inline]
```

Returns whether an error occurred in receive phase of an invocation.

**Precondition**

`l4_msgtag_has_error(tag) == true`

**Parameters**

<i>utcb</i>	UTCB to check.
-------------	----------------

**Returns**

Boolean value.

Definition at line 666 of file `ipc.h`.

References `l4_thread_regs_t::error`.

**13.1.14.5.3.5 l4\_ipc\_is\_snd\_error()**

```
int l4_ipc_is_snd_error (  
    l4_utcb_t * utcb ) [inline]
```

Returns whether an error occurred in send phase of an invocation.

**Precondition**

`l4_msgtag_has_error(tag) == true`

## Parameters

<i>utcb</i>	UTCB to check.
-------------	----------------

## Returns

Boolean value.

Definition at line 663 of file [ipc.h](#).

### 13.1.14.6 Message Items

Message item related functions.

Collaboration diagram for Message Items:

## Enumerations

- [l4\\_umword\\_t l4\\_map\\_obj\\_control](#) ([l4\\_umword\\_t](#) spot, unsigned grant) [L4\\_NOTHROW](#)  
*Create the first word for a map item for the object space.*

#### 13.1.14.6.1 Detailed Description

Message item related functions.

Message items are typed items that can be transferred via IPC operations. Message items are also used to specify receive windows for typed items to be received. Message items are placed in the message registers (MRs) of the UTCB of the sending thread. Receive items are placed in the buffer registers (BRs) of the UTCB of the receiving thread.

Message items are usually two-word data structures. The first word denotes the type of the message item (for example a memory flex-page, io flex-page or object flex-page) and the second word contains information depending on the type. There is actually one exception that is a small (one word) receive buffer item for a single capability.

### 13.1.14.6.2 Enumeration Type Documentation

#### 13.1.14.6.2.1 l4\_msg\_item\_consts\_t

enum `l4_msg_item_consts_t`

Constants for message items.

Enumerator

L4_ITEM_MAP	Identify a message item as <i>map item</i> .
L4_ITEM_CONT	Denote that the following item shall be put into the same receive item as this one.
L4_MAP_ITEM_GRANT	<p>Flag as <i>grant</i> instead of <i>map</i> operation. This means, the sender delegates access to the receiver and the kernel removes the rights from the sender (basically a move operation). The mapping in the receiver gets the new parent of any child mappings of the mapping of the sender. Rights revocation via send item/flexpage is <i>not</i> guaranteed to be applied to descendant mappings in case of grant. See <a href="#">Spaces and Mappings</a> for more details on map/grant.</p> <p><b>Note</b></p> <p>The grant operation is not performed if the resulting rights of the receiver mapping would not contain the <a href="#">L4_CAP_FPAGE_R</a> bit (for object capabilities) or none of the <a href="#">L4_FPAGE_RWX</a> bits (memory and IO ports). In that case, the mapping is not created in the receiver space and not removed from the sender space.</p> <p>If the removal of the whole mapping from the sender is not possible because the size of the mapped frame at the sender exceeds the size defined by the send or receive flexpage, the grant operation is turned into a regular map operation and the mapping is <i>not</i> removed from the sender. This would happen if, for example, a smaller part of an <a href="#">L4</a> superpage mapping shall be granted.</p>
L4_MAP_ITEM_MAP	Flag as usual <i>map</i> operation.
L4_RCV_ITEM_SINGLE_CAP	Mark the receive buffer to be a small receive item that describes a buffer for a single object capability.
L4_RCV_ITEM_LOCAL_ID	<p>The receiver requests to receive a local ID instead of a mapping whenever possible. This flag may only be used for small buffers, see <a href="#">L4_RCV_ITEM_SINGLE_CAP</a>.</p> <p>When this flag is set, then,</p> <ul style="list-style-type: none"> <li>• when sender and receiver are bound to the same task, then no mapping is done for this item and just the capability index is transferred,</li> <li>• otherwise, when the sender specified an IPC gate for transfer that is bound to a thread that is bound to the same task as the receiving thread, then no mapping is done for this item and just the label bitwise disjoint with the <a href="#">L4_CAP_FPAGE_W</a> and <a href="#">L4_CAP_FPAGE_S</a> permissions that would have been mapped is transferred,</li> <li>• otherwise a regular mapping is done for this item.</li> </ul>

Definition at line 224 of file [consts.h](#).

## Parameters

<i>spot</i>	Hot spot address, used to determine what is actually mapped when send and receive flex pages have different size.
<i>grant</i>	Indicates if it is a map item or a grant item. Allowed values: <a href="#">L4_MAP_ITEM_MAP</a> , <a href="#">L4_MAP_ITEM_GRANT</a> .

## Returns

The value to be used as first word in a map item for kernel objects or IO-ports.

#### 13.1.14.7.1 Detailed Description

API related to the message tag data type.

##### Include File

```
#include <l4/sys/types.h>
```

#### 13.1.14.7.2 Typedef Documentation

##### 13.1.14.7.2.1 `l4_msgtag_t`

```
typedef struct l4_msgtag_t l4_msgtag_t
```

Message tag data structure.

##### Include File

```
#include <l4/sys/types.h>
```

Describes the details of an IPC operation, in particular which parts of the UTCB have to be transmitted, and also flags to enable real-time and FPU extensions.

The message tag also contains a user-defined label that could be used to specify a protocol ID. Some negative values are reserved for kernel protocols such as page faults and exceptions.

The type must be treated completely opaque.

#### 13.1.14.7.3 Enumeration Type Documentation

##### 13.1.14.7.3.1 `L4_msgtag_flags`

```
enum L4_msgtag_flags
```

Flags for message tags.

##### Enumerator

<code>L4_MSGTAG_ERROR</code>	Error indicator flag.
<code>L4_MSGTAG_TRANSFER_FPU</code>	Enable FPU transfer flag for IPC. By enabling this flag when sending IPC, the sender indicates that the contents of the FPU shall be transferred to the receiving thread. However, the receiver has to indicate its willingness to receive FPU context in its buffer descriptor register (BDR).
Generated for L4Re by Doxygen	
<code>L4_MSGTAG_SCHEDULE</code>	Enable schedule in IPC flag. Usually IPC operations donate the remaining time slice of a thread to the called thread. Enabling this flag when sending IPC does a real scheduling decision. However, this flag decreases IPC

Definition at line 96 of file [types.h](#).

### 13.1.14.7.3.2 L4\_msgtag\_protocol

```
enum L4_msgtag_protocol
```

Message tag for IPC operations.

All predefined protocols used by the kernel.

#### Enumerator

L4_PROTO_NONE	Default protocol tag to reply to kernel.
L4_PROTO_ALLOW_SYSCALL	Allow an alien the system call.
L4_PROTO_PF_EXCEPTION	Make an exception out of a page fault.
L4_PROTO_IRQ	IRQ message.
L4_PROTO_PAGE_FAULT	Page fault message.
L4_PROTO_PREEMPTION	Preemption message.
L4_PROTO_SYS_EXCEPTION	System exception.
L4_PROTO_EXCEPTION	Exception.
L4_PROTO_SIGMA0	Sigma0 protocol.
L4_PROTO_IO_PAGE_FAULT	I/O page fault message.
L4_PROTO_KOBJECT	Protocol for messages to a generic kobject.
L4_PROTO_TASK	Protocol for messages to a task object.
L4_PROTO_THREAD	Protocol for messages to a thread object.
L4_PROTO_LOG	Protocol for messages to a log object.
L4_PROTO_SCHEDULER	Protocol for messages to a scheduler object.
L4_PROTO_FACTORY	Protocol for messages to a factory object.
L4_PROTO_VM	Protocol for messages to a virtual machine object.
L4_PROTO_DMA_SPACE	Protocol for (creating) kernel DMA space objects.
L4_PROTO_IRQ_SENDER	Protocol for IRQ senders (IRQ -> IPC)
L4_PROTO_IRQ_MUX	Protocol for IRQ mux (IRQ -> n x IRQ)
L4_PROTO_SEMAPHORE	Protocol for semaphore objects.
L4_PROTO_META	Meta information protocol.
L4_PROTO_IOMMU	Protocol ID for IO-MMUs.
L4_PROTO_DEBUGGER	Protocol ID for the debugger.
L4_PROTO_SMCCC	Protocol ID for ARM SMCCC calls.
L4_PROTO_VCPU_CONTEXT	Protocol for hardware vCPU contexts.

Definition at line 49 of file [types.h](#).

### 13.1.14.7.3.3 L4\_platform\_ctl\_proto

```
enum L4_platform_ctl_proto
```

Predefined protocol type for messages to platform-control objects.

## Enumerator

L4_PROTO_PLATFORM_CTL	Protocol messages to a platform control object. See <a href="#">L4_platform_ctl_ops</a> for allowed operations.
-----------------------	---

Definition at line 185 of file [platform\\_control.h](#).

## 13.1.14.7.4 Function Documentation

## 13.1.14.7.4.1 l4\_msgtag()

```
l4_msgtag_t l4_msgtag (
    long label,
    unsigned words,
    unsigned items,
    unsigned flags ) [inline]
```

Create a message tag from the specified values.

Message tag functions.

## Parameters

<i>label</i>	The user-defined label
<i>words</i>	The number of untyped words within the UTCB
<i>items</i>	The number of typed items (e.g., flex pages) within the UTCB
<i>flags</i>	The IPC flags for realtime and FPU extensions

## Returns

Message tag

## Examples

[examples/sys/aliens/main.c](#), [examples/sys/ipc/ipc\\_example.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

## Parameters

<i>t</i>	The tag
----------	---------

## Returns

Flags

Definition at line 452 of file [types.h](#).**13.1.14.7.4.3 l4\_msgtag\_has\_error()**

```
unsigned l4_msgtag_has_error (
    l4_msgtag_t t ) [inline]
```

Test for error indicator flag.

## Parameters

<i>t</i>	The tag
----------	---------

## Returns

&gt;0 for yes, 0 for no

Return whether the kernel operation caused a communication error, e.g. with IPC. if true: utcb->error is valid, otherwise utcb->error is not valid

## Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

#### 13.1.14.7.4.6 `l4_msgtag_is_page_fault()`

```
unsigned l4_msgtag_is_page_fault (
    l4_msgtag_t t ) [inline]
```

Test for page-fault protocol.

##### Parameters

<code>t</code>	The tag
----------------	---------

##### Returns

Boolean value

Definition at line 462 of file [types.h](#).

References [l4\\_msgtag\\_label\(\)](#), and [L4\\_PROTO\\_PAGE\\_FAULT](#).

Here is the call graph for this function:

#### 13.1.14.7.4.7 `l4_msgtag_is_preemption()`

```
unsigned l4_msgtag_is_preemption (
    l4_msgtag_t t ) [inline]
```

Test for preemption protocol.

**Parameters**

<i>t</i>	The tag
----------	---------

**Returns**

Boolean value

Definition at line 465 of file [types.h](#).

References [l4\\_msgtag\\_label\(\)](#), and [L4\\_PROTO\\_PREEMPTION](#).

Here is the call graph for this function:

**13.1.14.7.4.8 l4\_msgtag\_is\_sigma0()**

```
unsigned l4_msgtag_is_sigma0 (  
    l4_msgtag_t t ) [inline]
```

Test for sigma0 protocol.

**Parameters**

<i>t</i>	The tag
----------	---------

**Returns**

Boolean value

Definition at line 474 of file [types.h](#).

References [l4\\_msgtag\\_label\(\)](#), and [L4\\_PROTO\\_SIGMA0](#).

Here is the call graph for this function:

#### 13.1.14.7.4.9 l4\_msgtag\_is\_sys\_exception()

```
unsigned l4_msgtag_is_sys_exception (
    l4_msgtag_t t ) [inline]
```

Test for system-exception protocol.

##### Parameters

<i>t</i>	The tag
----------	---------

##### Returns

Boolean value

Definition at line 468 of file [types.h](#).

References [l4\\_msgtag\\_label\(\)](#), and [L4\\_PROTO\\_SYS\\_EXCEPTION](#).

Here is the call graph for this function:

#### 13.1.14.7.4.10 l4\_msgtag\_items()

```
unsigned l4_msgtag_items (
    l4_msgtag_t t ) [inline]
```

Get the number of typed items.

##### Parameters

<i>t</i>	The tag
----------	---------

##### Returns

Number of items.

Definition at line 448 of file [types.h](#).

Referenced by [l4util\\_ioport\\_map\(\)](#).

#### 13.1.14.8 Realtime API

Collaboration diagram for Realtime API:

#### 13.1.14.9 Timeouts

All kinds of timeouts and time related functions.

Collaboration diagram for Timeouts:

#### Data Structures

- struct [l4\\_timeout\\_s](#)  
*Basic timeout specification.*
- union [l4\\_timeout\\_t](#)  
*Timeout pair.*

## Macros

- `#define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})`  
*Timeout constants.*
- `#define L4_IPC_TIMEOUT_NEVER ((l4_timeout_s){0})`  
*never timeout*
- `#define L4_IPC_NEVER_INITIALIZER {0}`  
*never timeout, initializer*
- `#define L4_IPC_NEVER ((l4_timeout_t){0})`  
*never timeout*
- `#define L4_IPC_RECV_TIMEOUT_0 ((l4_timeout_t){0x00000400})`  
*0 receive timeout*
- `#define L4_IPC_SEND_TIMEOUT_0 ((l4_timeout_t){0x04000000})`  
*0 send timeout*
- `#define L4_IPC_BOTH_TIMEOUT_0 ((l4_timeout_t){0x04000400})`  
*0 receive and send timeout*
- `#define L4_TIMEOUT_US_NEVER (~0ULL)`  
*The waiting period in microseconds which is interpreted as "never" by l4\_timeout\_from\_us().*
- `#define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)`  
*The longest waiting period in microseconds accepted by l4\_timeout\_from\_us().*

## Typedefs

- `typedef struct l4_timeout_s l4_timeout_s`  
*Basic timeout specification.*
- `typedef union l4_timeout_t l4_timeout_t`  
*Timeout pair.*

## Functions

- `L4_CONSTEXPR l4_timeout_s l4_timeout_rel (unsigned man, unsigned exp) L4_NOTHROW`  
*Get relative timeout consisting of mantissa and exponent.*
- `L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (unsigned snd_man, unsigned snd_exp, unsigned rcv_man, unsigned rcv_exp) L4_NOTHROW`  
*Convert explicit timeout values to l4\_timeout\_t type.*
- `L4_CONSTEXPR l4_timeout_t l4_timeout (l4_timeout_s snd, l4_timeout_s rcv) L4_NOTHROW`  
*Combine send and receive timeout in a timeout.*
- `L4_CONSTEXPR void l4_snd_timeout (l4_timeout_s snd, l4_timeout_t *to) L4_NOTHROW`  
*Set send timeout in given to timeout.*
- `L4_CONSTEXPR void l4_rcv_timeout (l4_timeout_s rcv, l4_timeout_t *to) L4_NOTHROW`  
*Set receive timeout in given to timeout.*
- `L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (l4_timeout_s to) L4_NOTHROW`  
*Get clock value of out timeout.*
- `L4_CONSTEXPR unsigned l4_timeout_is_absolute (l4_timeout_s to) L4_NOTHROW`  
*Return whether the given timeout is absolute or not.*
- `L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (l4_kernel_clock_t cur, l4_timeout_s to) L4_NOTHROW`  
*Get clock value for a clock + a timeout.*
- `l4_timeout_s l4_timeout_abs (l4_kernel_clock_t pint, int br) L4_NOTHROW`  
*Set an absolute timeout.*
- `unsigned l4_utcb_mr64_idx (unsigned idx) L4_NOTHROW`  
*Get index into 64bit message registers alias from native-sized index.*

### 13.1.14.9.1 Detailed Description

All kinds of timeouts and time related functions.

### 13.1.14.9.2 Macro Definition Documentation

#### 13.1.14.9.2.1 L4\_IPC\_TIMEOUT\_0

```
#define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})
```

Timeout constants.

0 timeout

Definition at line 81 of file `__timeout.h`.

#### 13.1.14.9.2.2 L4\_TIMEOUT\_US\_MAX

```
#define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)
```

The longest waiting period in microseconds accepted by `l4_timeout_from_us()`.

See `l4_timeout_from_us()` for an explanation.

Definition at line 99 of file `__timeout.h`.

### 13.1.14.9.3 Typedef Documentation

#### 13.1.14.9.3.1 l4\_timeout\_s

```
typedef struct l4_timeout_s l4_timeout_s
```

Basic timeout specification.

Basically a floating point number with 10 bits mantissa and 5 bits exponent ( $t = m \cdot 2^e$ ).

If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.

#### 13.1.14.9.3.2 l4\_timeout\_t

```
typedef union l4_timeout_t l4_timeout_t
```

Timeout pair.

For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.

### 13.1.14.9.4 Function Documentation

#### 13.1.14.9.4.1 l4\_ipc\_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (
    unsigned snd_man,
    unsigned snd_exp,
    unsigned rcv_man,
    unsigned rcv_exp ) [inline]
```

Convert explicit timeout values to `l4_timeout_t` type.

## Parameters

<i>snd_man</i>	Mantissa of send timeout.
<i>snd_exp</i>	Exponent of send timeout.
<i>rcv_man</i>	Mantissa of receive timeout.
<i>rcv_exp</i>	Exponent of receive timeout.

Definition at line 211 of file [\\_\\_timeout.h](#).

References [l4\\_timeout\(\)](#).

Here is the call graph for this function:

#### 13.1.14.9.4.2 l4\_rcv\_timeout()

```

L4_CONSTEXPR void l4_rcv_timeout (
    l4_timeout_s rcv,
    l4_timeout_t * to ) [inline]
  
```

Set receive timeout in given to timeout.

## Parameters

	<i>rcv</i>	Receive timeout
out	<i>to</i>	<a href="#">L4</a> timeout

Definition at line 235 of file [\\_\\_timeout.h](#).

#### 13.1.14.9.4.3 l4\_snd\_timeout()

```

L4_CONSTEXPR void l4_snd_timeout (
    l4_timeout_s snd,
    l4_timeout_t * to ) [inline]
  
```

Set send timeout in given to timeout.

## Parameters

	<i>snd</i>	Send timeout
out	<i>to</i>	<a href="#">L4</a> timeout

Definition at line 228 of file [\\_\\_timeout.h](#).

References [l4\\_timeout\\_t::p](#), and [l4\\_timeout\\_t::snd](#).

#### 13.1.14.9.4.4 l4\_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_timeout (
    l4_timeout_s snd,
    l4_timeout_s rcv ) [inline]
```

Combine send and receive timeout in a timeout.

##### Parameters

<i>snd</i>	Send timeout
<i>rcv</i>	Receive timeout

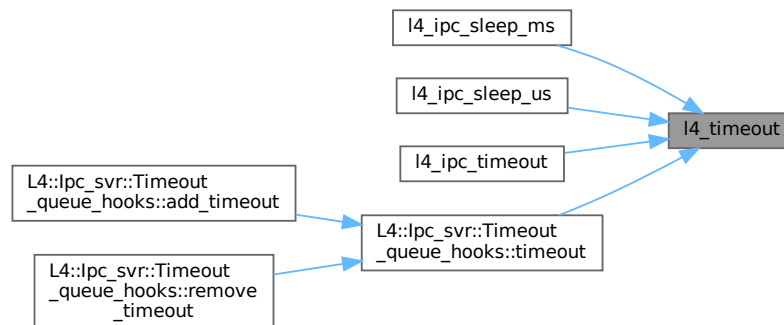

##### Returns

[L4](#) timeout

Definition at line 221 of file [\\_\\_timeout.h](#).

Referenced by [l4\\_ipc\\_sleep\\_ms\(\)](#), [l4\\_ipc\\_sleep\\_us\(\)](#), [l4\\_ipc\\_timeout\(\)](#), and [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN](#)

Here is the caller graph for this function:

#### 13.1.14.9.4.5 l4\_timeout\_abs()

```
l4_timeout_s l4_timeout_abs (
    l4_kernel_clock_t pint,
    int br ) [inline]
```

Set an absolute timeout.

## Parameters

<i>pint</i>	Point in time in clocks
<i>br</i>	The buffer register the timeout shall be placed in. (

## Note

On 32bit architectures the timeout needs two consecutive buffers.)

The absolute timeout value will be placed into the buffer register *br* of the current thread.

## Returns

timeout value

Definition at line 383 of file [utcb.h](#).

References [l4\\_utcb\(\)](#).

Referenced by [L4::lpc\\_svr::Timeout\\_queue\\_hooks<HOOKS, BR\\_MAN>::timeout\(\)](#).

#### 13.1.14.9.4.6 l4\_timeout\_get()

```

L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (
    l4_kernel_clock_t cur,
    l4_timeout_s to ) [inline]
  
```

Get clock value for a clock + a timeout.

## Parameters

<i>cur</i>	Clock value
<i>to</i>	<a href="#">L4</a> timeout

## Returns

Clock sum

Definition at line [265](#) of file [\\_\\_timeout.h](#).

References [l4\\_timeout\\_is\\_absolute\(\)](#), and [l4\\_timeout\\_rel\\_get\(\)](#).

#### 13.1.14.9.4.8 l4\_timeout\_rel()

```
L4_CONSTEXPR l4_timeout_s l4_timeout_rel (  
    unsigned man,  
    unsigned exp ) [inline]
```

Get relative timeout consisting of mantissa and exponent.

##### Parameters

<i>man</i>	Mantissa of timeout
<i>exp</i>	Exponent of timeout

##### Returns

timeout value

Definition at line 242 of file [\\_\\_timeout.h](#).

#### 13.1.14.9.4.9 l4\_timeout\_rel\_get()

```
L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (  
    l4_timeout_s to ) [inline]
```

Get clock value of out timeout.

##### Parameters

<i>to</i>	<a href="#">L4</a> timeout
-----------	----------------------------

##### Returns

Clock value

Definition at line 249 of file [\\_\\_timeout.h](#).

Referenced by [l4\\_timeout\\_get\(\)](#).

- [l4\\_thread\\_regs\\_t](#) \* [l4\\_utcb\\_tcr](#) (void) [L4\\_NOTHROW](#) [L4\\_PURE](#)  
*Get the thread-control-register block of a UTCB.*

### 13.1.14.10.1 Detailed Description

[L4](#) Virtual Registers (UTCB).

#### Include File

```
#include <l4/sys/utcb.h>
```

The virtual registers are part of the micro-kernel API and are located in the user-level thread control block (UTCB). The UTCB is a data structure defined by the micro kernel and located on kernel-provided memory. Each [L4](#) thread gets a unique UTCB assigned when it is bound to a task (see [Thread Control](#) , [l4\\_thread\\_control\\_bind\(\)](#) for more information).

The UTCB is arranged in three blocks of virtual registers.

- [Thread Control Registers \(TCRs\)](#)
- [Message Registers \(MRs\)](#)
- [Buffer Registers \(BRs\)](#)

To access the contents of the virtual registers the [l4\\_utcb\\_mr\(\)](#), [l4\\_utcb\\_tcr\(\)](#), and [l4\\_utcb\\_br\(\)](#) functions must be used.

### 13.1.14.10.2 Typedef Documentation

#### 13.1.14.10.2.1 l4\_utcb\_t

```
typedef struct l4_utcb_t l4_utcb_t
```

Opaque type for the UTCB.

To access the contents of the virtual registers the [l4\\_utcb\\_mr\(\)](#), [l4\\_utcb\\_tcr\(\)](#), and [l4\\_utcb\\_br\(\)](#) functions must be used.

Definition at line [67](#) of file [utcb.h](#).

### 13.1.14.10.3 Function Documentation

#### 13.1.14.10.3.1 l4\_utcb\_br()

```
l4_buf_regs_t * l4_utcb_br (  
    void ) [inline]
```

Get the buffer-register block of a UTCB.

**Returns**

A pointer to the buffer-register block of `u`.

Definition at line 355 of file `utcb.h`.

References `l4_utcb()`.

Referenced by `l4util_ioport_map()`.

Here is the call graph for this function:

*Check whether an exception IPC was triggered via [l4\\_thread\\_ex\\_regs\(\)](#).*

## Detailed Description

Overly definition of the MRs for exception messages.

## Function Documentation

### **l4\_utcb\_exc()**

```
l4_exc_regs_t * l4_utcb_exc (  
    void ) [inline]
```

Get the message-register block of a UTCB (for an exception IPC).

#### Returns

A pointer to the exception message in `u`.

#### Examples

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 361 of file [utcb.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### **l4\_utcb\_exc\_is\_ex\_regs\_exception()**

```
int l4_utcb_exc_is_ex_regs_exception (  
    l4_exc_regs_t const * u ) [inline]
```

Check whether an exception IPC was triggered via [l4\\_thread\\_ex\\_regs\(\)](#).

#### Return values

0	Exception was not triggered through <code>ex_regs</code> .
<code>!=0</code>	Exception was triggered through <code>ex_regs</code> .

This function checks if the exception was emitted by using the `L4_THREAD_EX_REGS_TRIGGER_EXCEPTION` flag in an `l4_thread_ex_regs()` call.

Definition at line 121 of file `utcb.h`.

References `l4_utcb_exc_typeval()`.

Here is the call graph for this function:

### **l4\_utcb\_exc\_is\_pf()**

```
int l4_utcb_exc_is_pf (
    l4_exc_regs_t const * u ) [inline]
```

Check whether an exception IPC is a page fault.

#### **Returns**

0 if not, != 0 if yes

Function to check whether an exception IPC is a page fault, also applies to I/O pagefaults.

Definition at line 111 of file `utcb.h`.

### **l4\_utcb\_exc\_pc()**

```
l4_umword_t l4_utcb_exc_pc (
    l4_exc_regs_t const * u ) [inline]
```

Access function to get the program counter of the exception state.

#### **Parameters**

<i>u</i>	UTCB
----------	------

#### **Returns**

The program counter register out of the exception state.

#### **Examples**

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 96 of file [utcb.h](#).

### **l4\_utcb\_exc\_pc\_set()**

```
void l4_utcb_exc_pc_set (
    l4_exc_regs_t * u,
    l4_addr_t pc ) [inline]
```

Set the program counter register in the exception state.

#### **Parameters**

<i>u</i>	UTCB
<i>pc</i>	The program counter to set.

Definition at line 101 of file [utcb.h](#).

### 13.2.1 Detailed Description

### 13.2.2 Enumeration Type Documentation

#### 13.2.2.1 Libedid\_consts

enum [Libedid\\_consts](#)

EDID constants.

Enumerator

<a href="#">Libedid_block_size</a>	Size of one EDID block in bytes.
------------------------------------	----------------------------------

Definition at line 23 of file [edid.h](#).

### 13.2.3 Function Documentation

#### 13.2.3.1 libedid\_check\_header()

```
int libedid_check_header (
    const unsigned char * edid )
```

Check for valid EDID header.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**Returns**

0 if the header is correct, -EINVAL otherwise

**13.2.3.2 libedid\_checksum()**

```
int libedid_checksum (
    const unsigned char * edid )
```

Calculates the EDID checksum.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**Returns**

0 if checksum is correct, -EINVAL otherwise

**13.2.3.3 libedid\_dump()**

```
void libedid_dump (
    const unsigned char * edid )
```

Dump raw EDID data to stdout.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**13.2.3.4 libedid\_dump\_standard\_timings()**

```
unsigned libedid_dump_standard_timings (
    const unsigned char * edid )
```

Dump the standard timings to stdout.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**Returns**

Number of standard timings stored in EDID

**13.2.3.5 libedid\_num\_ext\_blocks()**

```
unsigned libedid_num_ext_blocks (
    const unsigned char * edid )
```

Get the number of EDID extension blocks.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**Returns**

Number of EDID extension blocks

**13.2.3.6 libedid\_pnp\_id()**

```
void libedid_pnp_id (
    const unsigned char * edid,
    unsigned char * id )
```

Extracts the display's PnP ID.

**Parameters**

	<i>edid</i>	Pointer to a 128byte EDID block
out	<i>id</i>	Return the PnP id. Must point to 4 bytes.

**13.2.3.7 libedid\_prefered\_resolution()**

```
void libedid_prefered_resolution (
    const unsigned char * edid,
    unsigned * w,
    unsigned * h )
```

Extract the display's preferred mode.

**Parameters**

	<i>edid</i>	Pointer to a 128byte EDID block
out	<i>w</i>	X resolution of preferred video mode in pixels.
out	<i>h</i>	Y resolution of preferred video mode in pixels.

**13.2.3.8 libedid\_revision()**

```
unsigned libedid_revision (
    const unsigned char * edid )
```

Returns the EDID revision number.

**Parameters**

<i>edid</i>	Pointer to a 128 EDID block
-------------	-----------------------------

**Returns**

Revision number

**13.2.3.9 libedid\_version()**

```
unsigned libedid_version (
    const unsigned char * edid )
```

Returns the EDID version number.

**Parameters**

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

**Returns**

Version number

**13.3 IO interface****Typedefs**

- typedef [l4vbus\\_resource\\_t](#) [l4io\\_resource\\_t](#)  
*Resource descriptor.*

### 13.3.1 Detailed Description

### 13.3.2 Typedef Documentation

#### 13.3.2.1 `l4io_resource_t`

```
typedef l4vbus_resource_t l4io_resource_t
```

Resource descriptor.

For IRQ types, the end field is not used, i.e. only a single interrupt can be described with a `l4io_resource_t`

Definition at line 69 of file [types.h](#).

### 13.3.3 Enumeration Type Documentation

#### 13.3.3.1 `l4io_device_types_t`

```
enum l4io_device_types_t
```

Device types.

## Enumerator

L4IO_DEVICE_INVALID	Invalid type.
L4IO_DEVICE_PCI	PCI device.
L4IO_DEVICE_USB	USB device.
L4IO_DEVICE_OTHER	Any other device without unique IDs.
L4IO_DEVICE_ANY	any type

Definition at line 38 of file [types.h](#).

**13.3.3.2 l4io\_iomem\_flags\_t**

```
enum l4io_iomem_flags_t
```

Flags for IO memory.

## Enumerator

L4IO_MEM_NONCACHED	Non-cache memory.
L4IO_MEM_CACHED	Cache memory.
L4IO_MEM_USE_MTRR	Use MTRR.
L4IO_MEM_USE_RESERVED_AREA	Use reserved area for mapping I/O memory. Flag only valid for <a href="#">l4io_request_iomem_region()</a>
L4IO_MEM_EAGER_MAP	Eagerly map the I/O memory. Passthrough to the l4re-rm.

Definition at line 16 of file [types.h](#).

**13.3.3.3 l4io\_resource\_types\_t**

```
enum l4io_resource_types_t
```

Resource types.

## Enumerator

L4IO_RESOURCE_INVALID	Invalid type.
L4IO_RESOURCE_IRQ	Interrupt resource.
L4IO_RESOURCE_MEM	I/O memory resource.
L4IO_RESOURCE_PORT	I/O port resource (x86 only)
L4IO_RESOURCE_ANY	any type

Definition at line 50 of file [types.h](#).

**13.3.4 Function Documentation****13.3.4.1 l4io\_has\_resource()**

```
int l4io_has_resource (
```

```
enum l4io_resource_types_t type,
l4vbus_paddr_t start,
l4vbus_paddr_t end )
```

Check if a resource is available.

#### Parameters

<i>type</i>	Type of resource
<i>start</i>	Minimal value.
<i>end</i>	Maximum value.

### 13.3.4.2 l4io\_lookup\_device()

```
int l4io_lookup_device (
    const char * devname,
    l4io_device_handle_t * dev_handle,
    l4io_device_t * dev,
    l4io_resource_handle_t * res_handle )
```

Find a device by name.

#### Parameters

	<i>devname</i>	Name of device.
out	<i>dev_handle</i>	Device handle for found device, can be NULL.
out	<i>dev</i>	Device information, filled by the function, can be NULL.
out	<i>res_handle</i>	Resource handle, can be NULL.

#### Returns

0 on success, error code otherwise

### 13.3.4.3 l4io\_lookup\_resource()

```
int l4io_lookup_resource (
    l4io_device_handle_t devhandle,
    enum l4io_resource_types_t type,
    l4io_resource_handle_t * reshandle,
    l4io_resource_t * res )
```

Request a specific resource from a device description.

#### Parameters

	<i>devhandle</i>	Device handle.
	<i>type</i>	Type of resource to request (see <a href="#">l4io_resource_types_t</a> ).
in, out	<i>reshandle</i>	Resource handle, start with handle returned by device functions. The next resource handle is returned here.
out	<i>res</i>	Device descriptor.

**Returns**

0 on success, error code otherwise, esp. -L4\_ENOENT if no more resources found

**13.3.4.4 l4io\_release\_iomem()**

```
long l4io_release_iomem (
    l4_addr_t virt,
    unsigned long size )
```

Release an IO memory region.

**Parameters**

<i>virt</i>	Virtual address of region to free, see <a href="#">l4io_request_iomem</a>
<i>size</i>	Size of the region to release.

**Returns**

0 on success, <0 on error

**13.3.4.5 l4io\_release\_ioport()**

```
long l4io_release_ioport (
    unsigned portnum,
    unsigned len )
```

Release an IO port region.

**Parameters**

<i>portnum</i>	Start of port range to release
<i>len</i>	Length of range to request

**Returns**

0 on success, <0 on error

**Note**

X86 architecture only

**13.3.4.6 l4io\_request\_iomem()**

```
long l4io_request_iomem (
    l4_addr_t phys,
    unsigned long size,
    int flags,
    l4_addr_t * virt )
```

Request an IO memory region.

## Parameters

	<i>phys</i>	Physical address of the I/O memory region
	<i>size</i>	Size of the region in Bytes, granularity pages.
	<i>flags</i>	See <a href="#">l4io_iomem_flags_t</a>
<i>in, out</i>	<i>virt</i>	Virtual address where the IO memory region should be mapped to. If the caller passes '0' a region in the caller's address space is searched and the virtual address is returned.

## Return values

0	Success.
-L4_ENOENT	No area in the caller's address space could be found to map the IO memory region.
-L4_EPERM	Operation not allowed.
-L4_EINVAL	Invalid value.
-L4_EADDRNOTAVAIL	The requested virtual address is not available.
-L4_ENOMEM	The requested IO memory region could not be allocated.
<0	IPC errors.

## Note

This function uses [L4Re](#) functionality to reserve a part of the virtual address space of the caller.

## 13.3.4.7 l4io\_request\_iomem\_region()

```
long l4io_request_iomem_region (
    l4_addr_t phys,
    l4_addr_t virt,
    unsigned long size,
    int flags )
```

Request an IO memory region and map it to a specified region.

## Parameters

<i>phys</i>	Physical address of the I/O memory region
<i>virt</i>	Virtual address.
<i>size</i>	Size of the region in Bytes, granularity pages.
<i>flags</i>	See <a href="#">l4io_iomem_flags_t</a>

## Return values

0	Success.
-L4_ENOENT	No area could be found to map the IO memory region.
-L4_EPERM	Operation not allowed.
-L4_EINVAL	Invalid value.
-L4_EADDRNOTAVAIL	The requested virtual address is not available.
-L4_ENOMEM	The requested IO memory region could not be allocated.
<0	IPC errors.

**Note**

This function uses [L4Re](#) functionality to reserve a part of the virtual address space of the caller.

**13.3.4.8 l4io\_request\_ioport()**

```
long l4io_request_ioport (
    unsigned portnum,
    unsigned len )
```

Request an IO port region.

**Parameters**

<i>portnum</i>	Start of port range to request
<i>len</i>	Length of range to request

**Returns**

0 on success, <0 on error

**Note**

X86 architecture only

**13.3.4.9 l4io\_request\_resource\_iomem()**

```
l4_addr_t l4io_request_resource_iomem (
    l4io_device_handle_t devhandle,
    l4io_resource_handle_t * reshandle )
```

Request IO memory.

**Parameters**

	<i>devhandle</i>	Device handle.
<i>in, out</i>	<i>reshandle</i>	Resource handle from which IO memory should be requested. Upon successful completion 'reshandle' points to the device's next resource.

**Return values**

0	An error occurred. The value of 'reshandle' is undefined.
>0	The virtual address of the IO memory mapping.

## 13.4 IPC Helpers

### Functions

- void [L4::throw\\_ipc\\_exception](#) ([L4::Cap](#)< void > const &o, [l4\\_msgtag\\_t](#) const &err, [l4\\_utcb\\_t](#) \*utcb)  
*Throw an [L4](#) IPC error as exception.*
- void [L4::throw\\_ipc\\_exception](#) (void const \*o, [l4\\_msgtag\\_t](#) const &err, [l4\\_utcb\\_t](#) \*utcb)  
*Throw an [L4](#) IPC error as exception.*

### 13.4.1 Detailed Description

### 13.4.2 Function Documentation

#### 13.4.2.1 [throw\\_ipc\\_exception\(\)](#) [1/2]

```
void L4::throw_ipc_exception (
    L4::Cap< void > const & o,
    l4\_msgtag\_t const & err,
    l4\_utcb\_t * utcb ) [inline]
```

Throw an [L4](#) IPC error as exception.

#### Parameters

<i>o</i>	The client side object, for which the IPC was invoked.
<i>err</i>	The IPC result code (error code).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## 13.5 IRQ handling library

Collaboration diagram for IRQ handling library:

### Modules

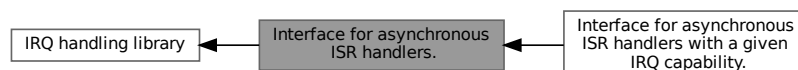

- [Interface for asynchronous ISR handlers.](#)  
*This interface has just two (main) functions.*
- [Interface using direct functionality.](#)

### 13.5.1 Detailed Description

### 13.5.2 Interface for asynchronous ISR handlers.

This interface has just two (main) functions.

Collaboration diagram for Interface for asynchronous ISR handlers.:

### Modules

- [Interface for asynchronous ISR handlers with a given IRQ capability.](#)  
*This group is just an enhanced version to [l4irq\\_request\(\)](#) which takes a capability object instead of a plain number.*

### Functions

- `l4irq_t * l4irq\_request (int irqnum, void(*isr_handler)(void *), void *isr_data, int irq_thread_prio, unsigned mode)`  
*Attach asynchronous ISR handler to IRQ.*
- `long l4irq\_release (l4irq_t *irq)`  
*Release asynchronous ISR handler and free resources.*

### 13.5.2.1 Detailed Description

This interface has just two (main) functions.

`l4irq_request` to install a handler for an interrupt and `l4irq_release` to uninstall the handler again and release all resources associated with it.

### 13.5.2.2 Function Documentation

#### 13.5.2.2.1 `l4irq_release()`

```
long l4irq_release (
    l4irq_t * irq )
```

Release asynchronous ISR handler and free resources.

##### Parameters

<i>irq</i>	IRQ data structure
------------	--------------------

##### Returns

0 success, != 0 failure

##### Examples

[examples/libs/libirq/async\\_isr.c](#).

#### 13.5.2.2.2 `l4irq_request()`

```
l4irq_t * l4irq_request (
    int irqnum,
    void(*) (void *) isr_handler,
    void * isr_data,
    int irq_thread_prio,
    unsigned mode )
```

Attach asynchronous ISR handler to IRQ.

##### Parameters

<i>irqnum</i>	IRQ number to request
<i>isr_handler</i>	Handler routine that is called when an interrupt triggers
<i>isr_data</i>	Pointer given as argument to <code>isr_handler</code>
<i>irq_thread_prio</i>	<a href="#">L4</a> thread priority of the ISR handler. Give -1 for same priority as creator.
<i>mode</i>	Interrupt type,

See also

[L4\\_irq\\_mode](#)

Returns

Pointer to `l4irq_t` structure, 0 on error

Examples

[examples/libs/libirq/async\\_isr.c](#).

### 13.5.2.3 Interface for asynchronous ISR handlers with a given IRQ capability.

This group is just an enhanced version to [l4irq\\_request\(\)](#) which takes a capability object instead of a plain number.

Collaboration diagram for Interface for asynchronous ISR handlers with a given IRQ capability.:

## Functions

- `l4irq_t * l4irq_request_cap (l4_cap_idx_t irqcap, void(*isr_handler)(void *), void *isr_data, int irq_thread_prio, unsigned mode)`

*Attach asynchronous ISR handler to IRQ.*

### 13.5.2.3.1 Detailed Description

This group is just an enhanced version to [l4irq\\_request\(\)](#) which takes a capability object instead of a plain number.

### 13.5.2.3.2 Function Documentation

#### 13.5.2.3.2.1 l4irq\_request\_cap()

```

l4irq_t * l4irq_request_cap (
    l4_cap_idx_t irqcap,
    void(*) (void *) isr_handler,
    void * isr_data,
    int irq_thread_prio,
    unsigned mode )
  
```

Attach asynchronous ISR handler to IRQ.

## Parameters

<i>irqcap</i>	IRQ capability
<i>isr_handler</i>	Handler routine that is called when an interrupt triggers
<i>isr_data</i>	Pointer given as argument to <i>isr_handler</i>
<i>irq_thread_prio</i>	<a href="#">L4</a> thread priority of the ISR handler. Give -1 for same priority as creator.
<i>mode</i>	Interrupt type,

## See also

[L4\\_irq\\_mode](#)

## Returns

Pointer to `l4irq_t` structure, 0 on error

### 13.5.3 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:

## Modules

- [Interface using direct functionality.](#)

## Functions

- `l4irq_t * l4irq\_attach (int irqnum)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq\_attach\_ft (int irqnum, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `l4irq_t * l4irq\_attach\_thread (int irqnum, l4\_cap\_idx\_t to_thread)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq\_attach\_thread\_ft (int irqnum, l4\_cap\_idx\_t to_thread, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `long l4irq\_wait (l4irq_t *irq)`  
*Wait for specified IRQ.*
- `long l4irq\_unmask\_and\_wait\_any (l4irq_t *unmask_irq, l4irq_t **ret_irq)`  
*Unmask a specific IRQ and wait for any attached IRQ.*
- `long l4irq\_wait\_any (l4irq_t **irq)`  
*Wait for any attached IRQ.*
- `long l4irq\_unmask (l4irq_t *irq)`  
*Unmask a specific IRQ.*
- `long l4irq\_detach (l4irq_t *irq)`  
*Detach from IRQ.*

### 13.5.3.1 Detailed Description

### 13.5.3.2 Function Documentation

#### 13.5.3.2.1 `l4irq_attach()`

```
l4irq_t * l4irq_attach (
    int irqnum )
```

Attach/connect to IRQ.

#### Parameters

<i>irqnum</i>	IRQ number to request
---------------	-----------------------

#### Returns

Pointer to `l4irq_t` structure, 0 on error

This `l4irq_attach` has to be called in the same thread as `l4irq_wait` and caller has to be a pthread thread.

#### Examples

[examples/libs/libirq/loop.c](#).

#### 13.5.3.2.2 `l4irq_attach_ft()`

```
l4irq_t * l4irq_attach_ft (
    int irqnum,
    unsigned mode )
```

Attach/connect to IRQ using given type.

#### Parameters

<i>irqnum</i>	IRQ number to request
<i>mode</i>	Interrupt type,

#### See also

[L4\\_irq\\_mode](#)

#### Returns

Pointer to `l4irq_t` structure, 0 on error

This `l4irq_attach` has to be called in the same thread as `l4irq_wait` and caller has to be a pthread thread.

### 13.5.3.2.3 l4irq\_attach\_thread()

```
l4irq_t * l4irq_attach_thread (
    int irqnum,
    l4_cap_idx_t to_thread )
```

Attach/connect to IRQ.

#### Parameters

<i>irqnum</i>	IRQ number to request
<i>to_thread</i>	Attach IRQ to this specified thread.

#### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

### 13.5.3.2.4 l4irq\_attach\_thread\_ft()

```
l4irq_t * l4irq_attach_thread_ft (
    int irqnum,
    l4_cap_idx_t to_thread,
    unsigned mode )
```

Attach/connect to IRQ using given type.

#### Parameters

<i>irqnum</i>	IRQ number to request
<i>to_thread</i>	Attach IRQ to this specified thread.
<i>mode</i>	Interrupt type,

#### See also

[L4\\_irq\\_mode](#)

#### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

### 13.5.3.2.5 l4irq\_detach()

```
long l4irq_detach (
    l4irq_t * irq )
```

Detach from IRQ.

**Parameters**

<i>irq</i>	IRQ data structure
------------	--------------------

**Returns**

0 on success, != 0 on error

**13.5.3.2.6 l4irq\_unmask()**

```
long l4irq_unmask (
    l4irq_t * irq )
```

Unmask a specific IRQ.

**Parameters**

<i>irq</i>	IRQ data structure
------------	--------------------

**Returns**

0 on success, != 0 on error

This function is useful if a thread wants to wait for multiple IRQs using l4\_ipc\_wait.

**13.5.3.2.7 l4irq\_unmask\_and\_wait\_any()**

```
long l4irq_unmask_and_wait_any (
    l4irq_t * unmask_irq,
    l4irq_t ** ret_irq )
```

Unmask a specific IRQ and wait for any attached IRQ.

**Parameters**

	<i>unmask_irq</i>	IRQ data structure for unmask.
out	<i>ret_irq</i>	Received interrupt.

**Returns**

0 on success, != 0 on error

**13.5.3.2.8 l4irq\_wait()**

```
long l4irq_wait (
    l4irq_t * irq )
```

Wait for specified IRQ.

## Parameters

<i>irq</i>	IRQ data structure
------------	--------------------

## Returns

0 on success, != 0 on error

## Examples

[examples/libs/libirq/loop.c](#).

## 13.5.3.2.9 l4irq\_wait\_any()

```
long l4irq_wait_any (
    l4irq_t ** irq )
```

Wait for any attached IRQ.

## Return values

<i>irq</i>	Received interrupt.
------------	---------------------

## Returns

0 on success, != 0 on error

## 13.5.3.3 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:

## Functions

- `l4irq_t * l4irq_attach_cap (l4_cap_idx_t irqcap)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_cap_ft (l4_cap_idx_t irqcap, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `l4irq_t * l4irq_attach_thread_cap (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_thread_cap_ft (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread, unsigned mode)`  
*Attach/connect to IRQ using given type.*

### 13.5.3.3.1 Detailed Description

### 13.5.3.3.2 Function Documentation

#### 13.5.3.3.2.1 l4irq\_attach\_cap()

```
l4irq_t * l4irq_attach_cap (
    l4_cap_idx_t irqcap )
```

Attach/connect to IRQ.

#### Parameters

<i>irqcap</i>	IRQ capability
---------------	----------------

#### Returns

Pointer to l4irq\_t structure, 0 on error

This l4irq\_attach has to be called in the same thread as l4irq\_wait and caller has to be a pthread thread.

#### 13.5.3.3.2.2 l4irq\_attach\_cap\_ft()

```
l4irq_t * l4irq_attach_cap_ft (
    l4_cap_idx_t irqcap,
    unsigned mode )
```

Attach/connect to IRQ using given type.

#### Parameters

<i>irqcap</i>	IRQ capability
<i>mode</i>	Interrupt type,

#### See also

[L4\\_irq\\_mode](#)

#### Returns

Pointer to l4irq\_t structure, 0 on error

This l4irq\_attach has to be called in the same thread as l4irq\_wait and caller has to be a pthread thread.

#### 13.5.3.3.2.3 l4irq\_attach\_thread\_cap()

```
l4irq_t * l4irq_attach_thread_cap (
    l4_cap_idx_t irqcap,
    l4_cap_idx_t to_thread )
```

Attach/connect to IRQ.

**Parameters**

<i>irqcap</i>	IRQ capability
<i>to_thread</i>	Attach IRQ to this thread.

**Returns**

Pointer to `l4irq_t` structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

**13.5.3.3.2.4 l4irq\_attach\_thread\_cap\_ft()**

```
l4irq_t * l4irq_attach_thread_cap_ft (
    l4_cap_idx_t irqcap,
    l4_cap_idx_t to_thread,
    unsigned mode )
```

Attach/connect to IRQ using given type.

**Parameters**

<i>irqcap</i>	IRQ capability
<i>to_thread</i>	Attach IRQ to this thread.
<i>mode</i>	Interrupt type,

**See also**

[L4\\_irq\\_mode](#)

**Returns**

Pointer to `l4irq_t` structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

## 13.6 L4 IPC Opcodes

List of protocol specific opcodes used for communication with [L4Re](#) and Kernel objects.

**Enumerations**

- enum [L4\\_icu\\_opcode](#) {  
[L4\\_ICU\\_OP\\_BIND](#) , [L4\\_ICU\\_OP\\_UNBIND](#) , [L4\\_ICU\\_OP\\_INFO](#) , [L4\\_ICU\\_OP\\_MSI\\_INFO](#) ,  
[L4\\_ICU\\_OP\\_UNMASK](#) , [L4\\_ICU\\_OP\\_MASK](#) , [L4\\_ICU\\_OP\\_SET\\_MODE](#) }  
*Opcodes to the ICU interface.*

### 13.6.1 Detailed Description

List of protocol specific opcodes used for communication with [L4Re](#) and Kernel objects.

### 13.6.2 Enumeration Type Documentation

#### 13.6.2.1 L4\_icu\_opcode

enum [L4\\_icu\\_opcode](#)

Opcodes to the ICU interface.

Enumerator

<a href="#">L4_ICU_OP_BIND</a>	Bind opcode.  See also  <a href="#">l4_icu_bind()</a>
<a href="#">L4_ICU_OP_UNBIND</a>	Unbind opcode.  See also  <a href="#">l4_icu_unbind()</a>

## Enumerator

L4_ICU_OP_INFO	Info opcode.  See also <a href="#">l4_icu_info()</a>
L4_ICU_OP_MSI_INFO	Msi-info opcode.  See also <a href="#">l4_icu_msi_info()</a>
L4_ICU_OP_UNMASK	Unmask opcode.  See also <a href="#">l4_icu_unmask()</a>
L4_ICU_OP_MASK	Mask opcode.  See also <a href="#">l4_icu_mask()</a>
L4_ICU_OP_SET_MODE	Set-mode opcode.  See also <a href="#">l4_icu_set_mode()</a>

Definition at line 106 of file [icu.h](#).

### 13.6.2.2 L4\_ipc\_gate\_ops

```
enum L4_ipc_gate_ops
```

Operations on the IPC-gate.

## Enumerator

L4_IPC_GATE_BIND_OP	Bind operation.
L4_IPC_GATE_GET_INFO_OP	Info operation.

Definition at line 116 of file [ipc\\_gate.h](#).

### 13.6.2.3 L4\_platform\_ctl\_ops

```
enum L4_platform_ctl_ops
```

Operations on platform-control objects.

See [L4\\_PROTO\\_PLATFORM\\_CTL](#) for the protocol type to use for messages to platform-control objects.

## Enumerator

L4_PLATFORM_CTL_SYS_SUSPEND_OP	Suspend.
L4_PLATFORM_CTL_SYS_SHUTDOWN_OP	shutdown/reboot
L4_PLATFORM_CTL_CPU_ALLOW_SHUTDOWN_OP	allow CPU shutdown
L4_PLATFORM_CTL_CPU_ENABLE_OP	enable an offline CPU
L4_PLATFORM_CTL_CPU_DISABLE_OP	disable an online CPU
L4_PLATFORM_CTL_SET_TASK_ASID_OP	Arm: set task ASID.

Definition at line 170 of file [platform\\_control.h](#).

### 13.6.2.4 L4\_task\_ops

enum [L4\\_task\\_ops](#)

Operations on task objects.

## Enumerator

L4_TASK_MAP_OP	Map.
L4_TASK_UNMAP_OP	Unmap.
L4_TASK_CAP_INFO_OP	Cap info.
L4_TASK_ADD_KU_MEM_OP	Add kernel-user memory.
L4_TASK_LDT_SET_X86_OP	x86: LDT set
L4_TASK_MAP_VGICC_ARM_OP	Arm: Map virtual GICC area.

Definition at line 312 of file [task.h](#).

### 13.6.2.5 L4\_thread\_ops

enum [L4\\_thread\\_ops](#)

Operations on thread objects.

## Enumerator

L4_THREAD_CONTROL_OP	Control operation.
L4_THREAD_EX_REGS_OP	Exchange registers operation.
L4_THREAD_SWITCH_OP	Do a thread switch.
L4_THREAD_STATS_OP	Thread statistics.
L4_THREAD_VCPU_RESUME_OP	VCPU resume.
L4_THREAD_REGISTER_DELETE_IRQ_OP	Register an IPC-gate deletion IRQ.
L4_THREAD_MODIFY_SENDER_OP	Modify all senders IDs that match the given pattern.
L4_THREAD_VCPU_CONTROL_OP	Enable / disable VCPU feature.
L4_THREAD_X86_GDT_OP	Gdt.
L4_THREAD_ARM_TPIDRURO_OP	Set TPIDRURO register.
L4_THREAD_AMD64_SET_SEGMENT_BASE_OP	Set segment base.
L4_THREAD_AMD64_GET_SEGMENT_INFO_OP	Get segment information.
L4_THREAD_OPCODE_MASK	Mask for opcodes.

Definition at line 693 of file [thread.h](#).

### 13.6.2.6 L4\_vcon\_ops

enum [L4\\_vcon\\_ops](#)

Operations on vcon objects.

Enumerator

L4_VCON_WRITE_OP	Write.
L4_VCON_READ_OP	Read.
L4_VCON_SET_ATTR_OP	Get console attributes.
L4_VCON_GET_ATTR_OP	Set console attributes.

Definition at line 300 of file [vcon.h](#).

## 13.7 L4 VIRTIO Interface

Collaboration diagram for L4 VIRTIO Interface:

### Modules

- [L4 VIRTIO Block Device](#)
- [L4 VIRTIO Input Device](#)
- [L4 VIRTIO Network Device](#)
- [L4 VIRTIO Transport Layer](#)

*[L4](#) specific VIRTIO Transport layer.*

### 13.7.1 Detailed Description

### 13.7.2 L4 VIRTIO Block Device

Collaboration diagram for L4 VIRTIO Block Device:

#### Data Structures

- struct [l4virtio\\_block\\_header\\_t](#)  
*Header structure of a request for a block device.*
- struct [l4virtio\\_block\\_discard\\_t](#)  
*Structure used for the write zeroes and discard commands.*
- struct [l4virtio\\_block\\_config\\_t](#)  
*Device configuration for block devices.*

#### Typedefs

- typedef struct [l4virtio\\_block\\_header\\_t](#) [l4virtio\\_block\\_header\\_t](#)  
*Header structure of a request for a block device.*
- typedef struct [l4virtio\\_block\\_discard\\_t](#) [l4virtio\\_block\\_discard\\_t](#)  
*Structure used for the write zeroes and discard commands.*
- typedef struct [l4virtio\\_block\\_config\\_t](#) [l4virtio\\_block\\_config\\_t](#)  
*Device configuration for block devices.*

#### Enumerations

- enum [L4virtio\\_block\\_operations](#) {  
[L4VIRTIO\\_BLOCK\\_T\\_IN](#) = 0 , [L4VIRTIO\\_BLOCK\\_T\\_OUT](#) = 1 , [L4VIRTIO\\_BLOCK\\_T\\_FLUSH](#) = 4 ,  
[L4VIRTIO\\_BLOCK\\_T\\_GET\\_ID](#) = 8 ,  
[L4VIRTIO\\_BLOCK\\_T\\_DISCARD](#) = 11 , [L4VIRTIO\\_BLOCK\\_T\\_WRITE\\_ZEROES](#) = 13 }  
*Kinds of operation over a block device.*
- enum [L4virtio\\_block\\_status](#) { [L4VIRTIO\\_BLOCK\\_S\\_OK](#) = 0 , [L4VIRTIO\\_BLOCK\\_S\\_IOERR](#) = 1 ,  
[L4VIRTIO\\_BLOCK\\_S\\_UNSUPP](#) = 2 }  
*Status of a finished block request.*

#### 13.7.2.1 Detailed Description

#### 13.7.2.2 Enumeration Type Documentation

##### 13.7.2.2.1 L4virtio\_block\_operations

enum [L4virtio\\_block\\_operations](#)

Kinds of operation over a block device.

## Enumerator

L4VIRTIO_BLOCK_T_IN	Read from device.
L4VIRTIO_BLOCK_T_OUT	Write to device.
L4VIRTIO_BLOCK_T_FLUSH	Flush data to disk.
L4VIRTIO_BLOCK_T_GET_ID	Get device ID.
L4VIRTIO_BLOCK_T_DISCARD	Discard a range of sectors.
L4VIRTIO_BLOCK_T_WRITE_ZEROES	Write zeroes to a range of sectors.

Definition at line 19 of file [virtio\\_block.h](#).

## 13.7.2.2.2 L4virtio\_block\_status

enum [L4virtio\\_block\\_status](#)

Status of a finished block request.

## Enumerator

L4VIRTIO_BLOCK_S_OK	Request finished successfully.
L4VIRTIO_BLOCK_S_IOERR	IO error on device.
L4VIRTIO_BLOCK_S_UNSUPP	Operation is not supported.

Definition at line 32 of file [virtio\\_block.h](#).

## 13.7.3 L4 VIRTIO Input Device

Collaboration diagram for L4 VIRTIO Input Device:

## Data Structures

- struct [l4virtio\\_input\\_absinfo\\_t](#)  
*Information about the absolute axis in the underlying evdev implementation.*
- struct [l4virtio\\_input\\_devids\\_t](#)

- int `l4virtio_device_notification_irq` (`l4_cap_idx_t` cap, unsigned index, `l4_cap_idx_t` irq) `L4_NOTHROW`

### 13.7.5.1 Detailed Description

`L4` specific VIRTIO Transport layer.

The `L4` specific VIRTIO Transport layer is based on `L4Re::Dataspace` as shared memory and `L4::Irq` for signaling. The VIRTIO configuration space is mostly based on a shared memory implementation too and accompanied by two IPC functions to synchronize the configuration between device and driver.

### 13.7.5.2 Typedef Documentation

#### 13.7.5.2.1 l4virtio\_config\_queue\_t

```
typedef struct l4virtio_config_queue_t l4virtio_config_queue_t
```

Queue configuration entry.

An array of such entries is available at the `l4virtio_config_hdr_t::queues_offset` in the config data space.

Consistency rules for the queue config are:

- A driver might read `num_max` at any time.
- A driver must write to `num`, `desc_addr`, `avail_addr`, and `used_addr` only when `ready` is zero (0). Values in these fields are validated and used by the device only after successfully setting `ready` to one (1), either by the IPC or by `L4VIRTIO_CMD_CFG_QUEUE`.
- The value of `device_notify_index` is valid only when `ready` is one.
- The driver might write to `device_notify_index` at any time, however the change is guaranteed to take effect after a successful `L4VIRTIO_CMD_CFG_QUEUE` or after a `config_queue` IPC. Note, the change might also have immediate effect, depending on the device implementation.

### 13.7.5.3 Enumeration Type Documentation

#### 13.7.5.3.1 L4\_virtio\_cmd

```
enum L4_virtio_cmd
```

Virtio commands for device configuration.

Enumerator

<code>L4VIRTIO_CMD_NONE</code>	No command pending.
<code>L4VIRTIO_CMD_SET_STATUS</code>	Set the status register.
<code>L4VIRTIO_CMD_CFG_QUEUE</code>	Configure a queue.
<code>L4VIRTIO_CMD_CFG_CHANGED</code>	Device config changed.
<code>L4VIRTIO_CMD_NOTIFY_QUEUE</code>	Configure a queue.
<code>L4VIRTIO_CMD_MASK</code>	Mask to get command bits.

Definition at line 116 of file [virtio.h](#).

#### 13.7.5.3.2 L4\_virtio\_irq\_status

```
enum L4_virtio_irq_status
```

VIRTIO IRQ status codes (`l4virtio_config_hdr_t::irq_status`).

Note

`l4virtio_config_hdr_t::irq_status` is currently unused.

## Enumerator

L4VIRTIO_IRQ_STATUS_VRING	VRING IRQ pending flag.
L4VIRTIO_IRQ_STATUS_CONFIG	CONFIG IRQ pending flag.

Definition at line 107 of file [virtio.h](#).

**13.7.5.3.3 L4\_virtio\_opcodes**

```
enum L4_virtio_opcodes
```

Opcodes to setup and configure a device.

## Enumerator

L4VIRTIO_OP_SET_STATUS	Write device status register.
L4VIRTIO_OP_CONFIG_QUEUE	Configure queue.
L4VIRTIO_OP_REGISTER_DS	Register shared memory with device.
L4VIRTIO_OP_DEVICE_CONFIG	Get device config page.
L4VIRTIO_OP_GET_DEVICE_IRQ	Retrieve device notification IRQ.

Definition at line 51 of file [virtio.h](#).

**13.7.5.3.4 L4virtio\_device\_ids**

```
enum L4virtio_device_ids
```

Virtio device IDs as reported in the driver's config space.

## Enumerator

L4VIRTIO_ID_NET	Virtual ethernet card.
L4VIRTIO_ID_BLOCK	General block device.
L4VIRTIO_ID_CONSOLE	Simple device for data IO via ports.
L4VIRTIO_ID_RNG	Entropy source.
L4VIRTIO_ID_BALLOON	Memory ballooning device.
L4VIRTIO_ID_RPMMSG	Device using rpmsg protocol.
L4VIRTIO_ID_SCSI	SCSI host device.
L4VIRTIO_ID_9P	Device using 9P transport protocol.
L4VIRTIO_ID_RPROC_SERIAL	Rproc serial device.
L4VIRTIO_ID_CAIF	Device using CAIF network protocol.
L4VIRTIO_ID_GPU	GPU.
L4VIRTIO_ID_INPUT	Input.
L4VIRTIO_ID_VSOCK	Vsock transport.
L4VIRTIO_ID_CRYPT	Crypto.
L4VIRTIO_ID_FS	FS.
L4VIRTIO_ID_SCSI	Scmi device.
L4VIRTIO_ID_SOCKET	Unofficial socket device.

Definition at line 61 of file [virtio.h](#).

### 13.7.5.3.5 L4virtio\_device\_status

enum [L4virtio\\_device\\_status](#)

Virtio device status bits.

#### Enumerator

L4VIRTIO_STATUS_ACKNOWLEDGE	Guest OS has found device.
L4VIRTIO_STATUS_DRIVER	Guest OS knows how to drive device.
L4VIRTIO_STATUS_DRIVER_OK	Driver is set up.
L4VIRTIO_STATUS_FEATURES_OK	Driver has acknowledged feature set.
L4VIRTIO_STATUS_DEVICE_NEEDS_RESET	Device detected fatal error.
L4VIRTIO_STATUS_FAILED	Driver detected fatal error.

Definition at line 84 of file [virtio.h](#).

### 13.7.5.3.6 L4virtio\_feature\_bits

enum [L4virtio\\_feature\\_bits](#)

L4virtio-specific feature bits.

#### Enumerator

L4VIRTIO_FEATURE_VERSION_1	Virtio protocol version 1 supported. Must be 1 for <a href="#">L4virtio</a> .
L4VIRTIO_FEATURE_CMD_CONFIG	Status and queue config are set via cmd field instead of via IPC.

Definition at line 95 of file [virtio.h](#).

## 13.7.5.4 Function Documentation

### 13.7.5.4.1 l4virtio\_config\_queue()

```
int l4virtio_config_queue (
    l4_cap_idx_t cap,
    unsigned queue )
```

#### Parameters

<i>cap</i>	Capability to the VIRTIO host.
------------	--------------------------------

Trigger queue configuration of the given queue.

Usually all queues are configured when the status is written to running. However, in some cases queues shall

be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

#### Parameters

<i>queue</i>	Queue index for the queue to be configured.
--------------	---

#### Return values

0	on success.
-L4_EIO	The queue's status is invalid.
-L4_ERANGE	The queue index exceeds the number of queues.
-L4_EINVAL	Otherwise.

#### 13.7.5.4.2 l4virtio\_config\_queues()

```
l4virtio_config_queue_t * l4virtio_config_queues (
    l4virtio_config_hdr_t const * cfg ) [inline]
```

Get the pointer to the first queue config.

#### Parameters

<i>cfg</i>	Pointer to the config header.
------------	-------------------------------

#### Returns

pointer to queue config of queue 0.

Definition at line 249 of file [virtio.h](#).

References [l4virtio\\_config\\_hdr\\_t::queues\\_offset](#).

#### 13.7.5.4.3 l4virtio\_device\_config()

```
void * l4virtio_device_config (
    l4virtio_config_hdr_t const * cfg ) [inline]
```

Get the pointer to the device configuration.

#### Parameters

<i>cfg</i>	Pointer to the config header.
------------	-------------------------------

#### Returns

pointer to device configuration structure.

Definition at line 260 of file [virtio.h](#).

#### 13.7.5.4.4 l4virtio\_device\_config\_ds()

```
int l4virtio_device_config_ds (
    l4_cap_idx_t cap,
    l4_cap_idx_t config_ds,
    l4_addr_t * ds_offset )
```

##### Parameters

<i>cap</i>	Capability to the L4-VIRTIO host
------------	----------------------------------

Get the dataspace with the [L4virtio](#) configuration page.

##### Parameters

<i>config_ds</i>	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
<i>ds_offset</i>	Offset into the dataspace where the device configuration structure starts.

#### 13.7.5.4.5 l4virtio\_device\_notification\_irq()

```
int l4virtio_device_notification_irq (
    l4_cap_idx_t cap,
    unsigned index,
    l4_cap_idx_t irq )
```

##### Parameters

<i>cap</i>	Capability to the L4-VIRTIO host
------------	----------------------------------

Get the notification interrupt corresponding to the given index.

##### Parameters

	<i>index</i>	Index of the interrupt.
out	<i>irq</i>	Triggerable for the given index.

##### Return values

<i>L4_EOK</i>	Success.
<i>L4_ENOSYS</i>	IRQ notification not supported by device.
<i>&lt;0</i>	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.

Interrupts must always be rerequested after a device reset.

#### 13.7.5.4.6 l4virtio\_register\_ds()

```
int l4virtio_register_ds (
    l4_cap_idx_t cap,
    l4_cap_idx_t ds_cap,
    l4_uint64_t base,
    l4_umword_t offset,
    l4_umword_t size )
```

##### Parameters

<i>cap</i>	Capability to the VIRTIO host
------------	-------------------------------

Register a shared data space with VIRTIO host.

##### Parameters

<i>ds_cap</i>	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
<i>base</i>	VIRTIO guest physical start address of shared memory region
<i>offset</i>	Offset within the data space that is attached to the given <i>base</i> in the guest physical memory.
<i>size</i>	Size of the memory region in the guest

##### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	The <i>ds_cap</i> capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or <i>size</i> and <i>offset</i> specify an invalid region.
<i>-L4_ENOMEM</i>	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.
<i>&lt;0</i>	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

#### 13.7.5.4.7 l4virtio\_set\_status()

```
int l4virtio_set_status (
    l4_cap_idx_t cap,
    unsigned status )
```

##### Parameters

<i>cap</i>	Capability to the VIRTIO host
------------	-------------------------------

Write the VIRTIO status register.

##### Parameters

<i>status</i>	Status word to write to the VIRTIO status.
---------------	--

## Return values

0	on success.
---	-------------

## Note

All other registers are accessed via shared memory.

## 13.8 L4 Vbus functions

C interface of the Vbus API.

Collaboration diagram for L4 Vbus functions:

## Modules

- [L4vbus GPIO functions](#)
- [L4vbus PCI functions](#)
- [L4vbus power management functions](#)

## Enumerations

- enum [L4vbus\\_dma\\_domain\\_assign\\_flags](#) { [L4VBUS\\_DMAD\\_UNBIND](#) = 0 , [L4VBUS\\_DMAD\\_BIND](#) = 1 , [L4VBUS\\_DMAD\\_L4RE\\_DMA\\_SPACE](#) = 0 , [L4VBUS\\_DMAD\\_KERNEL\\_DMA\\_SPACE](#) = 2 }
- Flags for [l4vbus\\_assign\\_dma\\_domain\(\)](#).*

## Functions

- `int l4vbus_get_device_by_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, char const *hid, int depth, l4vbus_device_t *devinfo)`  
*Find a device by the hardware interface identifier (HID).*
- `int l4vbus_get_next_device (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, int depth, l4vbus_device_t *devinfo)`  
*Find next child following `child`.*
- `int l4vbus_get_device (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4vbus_device_t *devinfo)`  
*Obtain detailed information about a Vbus device.*
- `int l4vbus_get_resource (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, unsigned res_idx, l4vbus_resource_t *res)`  
*Obtain the resource description of an individual device resource.*
- `int l4vbus_is_compatible (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char const *cid)`  
*Check if the given device has a compatibility ID (CID) or HID that matches `cid`.*
- `int l4vbus_get_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char *hid, unsigned long max_len)`  
*Get the HID (hardware identifier) of a device.*
- `int l4vbus_get_adr (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4_uint32_t *adr)`  
*Get the bus-specific address of a device.*
- `int l4vbus_request_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)`  
*Request an IO port resource.*
- `int l4vbus_assign_dma_domain (l4_cap_idx_t vbus, unsigned domain_id, unsigned flags, l4_cap_idx_t dma_space)`  
*Bind or unbind a kernel [DMA space](#) or a `L4Re::Dma_space` to a DMA domain.*
- `int l4vbus_release_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)`  
*Release a previously requested IO port resource.*
- `int l4vbus_vicu_get_cap (l4_cap_idx_t vbus, l4vbus_device_handle_t icu, l4_cap_idx_t cap)`  
*Get capability of ICU.*

### 13.8.1 Detailed Description

C interface of the Vbus API.

The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an `lcu` ([Interrupt controller](#)) for interrupt handling.

The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

#### Include File

```
#include <l4/vbus/vbus.h>
```

Refer to [L4vbus](#) for the C++ API.

### 13.8.2 Enumeration Type Documentation

#### 13.8.2.1 L4vbus\_dma\_domain\_assign\_flags

```
enum L4vbus_dma_domain_assign_flags
```

Flags for `l4vbus_assign_dma_domain()`.

## Enumerator

L4VBUS_DMAD_UNBIND	Unbind the given DMA space from the DMA domain.
L4VBUS_DMAD_BIND	Bind the given DMA space to the DMA domain.
L4VBUS_DMAD_L4RE_DMA_SPACE	The given DMA space is an <a href="#">L4Re::Dma_space</a> .
L4VBUS_DMAD_KERNEL_DMA_SPACE	The given DMA space is a kernel DMA space ( <a href="#">L4::Task</a> )

Definition at line 176 of file [vbus.h](#).

### 13.8.3 Function Documentation

#### 13.8.3.1 l4vbus\_assign\_dma\_domain()

```
int l4vbus_assign_dma_domain (
    l4_cap_idx_t vbus,
    unsigned domain_id,
    unsigned flags,
    l4_cap_idx_t dma_space )
```

Bind or unbind a kernel [DMA space](#) or a [L4Re::Dma\\_space](#) to a DMA domain.

## Parameters

<i>vbus</i>	Capability of the system bus
<i>domain_id</i>	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
<i>flags</i>	A combination of <a href="#">L4vbus_dma_domain_assign_flags</a> .
<i>dma_space</i>	The DMA space capability to bind or unbind, this must either be an <a href="#">L4Re::Dma_space</a> or a kernel <a href="#">DMA space</a> ( <a href="#">L4::Task</a> created with L4_PROTO_DMA_SPACE) and the type must be reflected in the <i>flags</i> .

## Return values

0	Operation completed successfully.
-L4_ENOENT	The vbus does not support a global DMA domain or no DMA domain could be found.
-L4_EINVAL	Invalid argument used.
-L4_EBUSY	DMA domain is already active, this means another DMA space is already assigned.

Referenced by [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), and [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#).

Here is the caller graph for this function:

### 13.8.3.2 l4vbus\_get\_adr()

```
int l4vbus_get_adr (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    l4_uint32_t * adr )
```

Get the bus-specific address of a device.

#### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>dev</i>	Handle of the device
out	<i>adr</i>	Address

#### Return values

<i>L4_EOK</i>	Success.
<i>-L4_ENOSYS</i>	Device has no valid address.

### 13.8.3.3 l4vbus\_get\_device()

```
int l4vbus_get_device (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    l4vbus_device_t * devinfo )
```

Obtain detailed information about a Vbus device.

#### Parameters

	<i>vbus</i>	Capability of the vbus to which the device is connected.
	<i>dev</i>	Device handle of the device from which to retrieve the details.
out	<i>devinfo</i>	Information structure which contains details about the device. The pointer might be NULL.

## Return values

<i>0</i>	Success.
<i>-L4_ENODEV</i>	No device with the given device handle <i>dev</i> could be found.

Referenced by [L4vbus::Device::device\(\)](#).

Here is the caller graph for this function:

## 13.8.3.4 l4vbus\_get\_device\_by\_hid()

```

int l4vbus_get_device_by_hid (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t parent,
    l4vbus_device_handle_t * child,
    char const * hid,
    int depth,
    l4vbus_device_t * devinfo )

```

Find a device by the hardware interface identifier (HID).

## Parameters

<i>vbus</i>	Capability of the system bus
<i>parent</i>	Handle to the parent to start the search

This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.

It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with *child* pointing to the device found in the previous iteration. The iteration starts at *child* that might be any device node in the tree.

## Parameters

<i>in, out</i>	<i>child</i>	Handle of the device from where in the device tree the search should start. To start searching from the beginning <i>child</i> must be initialized using the default ( <a href="#">L4VBUS_NULL</a> ). If a matching device is found, its handle is returned through this parameter.
	<i>hid</i>	HID of the device
	<i>depth</i>	Maximum depth for the recursive lookup
<i>out</i>	<i>devinfo</i>	Device information structure (might be NULL)

## Return values

<code>&gt;=0</code>	A device with the given HID was found.
<code>-L4_ENOENT</code>	No device with the given HID could be found on the vbus.
<code>-L4_EINVAL</code>	Invalid or no HID provided.
<code>-L4_ENODEV</code>	Function called on a non-existing device.

Referenced by [L4vbus::Device::device\\_by\\_hid\(\)](#).

Here is the caller graph for this function:

### 13.8.3.5 l4vbus\_get\_hid()

```

int l4vbus_get_hid (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    char * hid,
    unsigned long max_len )
  
```

Get the HID (hardware identifier) of a device.

## Parameters

<i>vbus</i>	Capability of the system bus
<i>dev</i>	Handle of the device
<i>hid</i>	Pointer to a buffer for the HID string
<i>max_len</i>	The size of the buffer ( <i>hid</i> )

## Returns

the length of the HID string on success, else failure

### 13.8.3.6 l4vbus\_get\_next\_device()

```

int l4vbus_get_next_device (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t parent,
    l4vbus_device_handle_t * child,
  
```

```
int depth,  
l4vbus_device_t * devinfo )
```

Find next child following `child`.

## Parameters

	<i>vbus</i>	Capability of the system bus
	<i>parent</i>	Handle to the parent device (use <a href="#">L4VBUS_ROOT_BUS</a> for the system bus)
in, out	<i>child</i>	Handle of the device that precedes the device that shall be returned. To start from the beginning, <i>child</i> must be initialized with <a href="#">L4VBUS_NULL</a> . If a device is found, its handle is returned through this parameter.
	<i>depth</i>	Depth to look for
out	<i>devinfo</i>	Device information (might be NULL)

## Returns

0 on success, else failure

Referenced by [L4vbus::Device::next\\_device\(\)](#).

Here is the caller graph for this function:

## 13.8.3.7 l4vbus\_get\_resource()

```

int l4vbus_get_resource (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    unsigned res_idx,
    l4vbus_resource_t * res )
  
```

Obtain the resource description of an individual device resource.

## Parameters

	<i>vbus</i>	Capability of the vbus to which the device is connected.
	<i>dev</i>	Device handle of the device on the vbus. The device handle can be obtained by using the <a href="#">l4vbus_get_device_by_hid()</a> and <a href="#">l4vbus_get_next_device()</a> functions.
	<i>res_idx</i>	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the <a href="#">l4vbus_device_t</a> structure that is returned by <a href="#">L4vbus::Device::device_by_hid()</a> and <a href="#">L4vbus::Device::next_device()</a> .
out	<i>res</i>	Descriptor of the resource.

This function returns the resource descriptor of an individual device resource selected by the *res\_idx* parameter.

## Return values

0	Success.
-L4_ENOENT	Invalid resource index <code>res_idx</code> .

Referenced by [L4vbus::Device::get\\_resource\(\)](#).

Here is the caller graph for this function:

### 13.8.3.8 l4vbus\_is\_compatible()

```
int l4vbus_is_compatible (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    char const * cid )
```

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.

## Parameters

<i>vbus</i>	Capability of the system bus
<i>dev</i>	device handle for which the CID shall be tested
<i>cid</i>	the compatibility ID to test

## Returns

1 when the given ID (*cid*) matches this device, 0 when the given ID does not match, <0 on error.

Referenced by [L4vbus::Device::is\\_compatible\(\)](#).

Here is the caller graph for this function:

### 13.8.3.9 l4vbus\_release\_ioport()

```
int l4vbus_release_ioport (
    l4_cap_idx_t vbus,
    l4vbus_resource_t const * res )
```

Release a previously requested IO port resource.

#### Parameters

	<i>vbus</i>	Capability of the system bus.
in	<i>res</i>	The IO port resource to be released from the bus.

#### Returns

>=0 on success, <0 on error.

Referenced by [L4vbus::Vbus::release\\_ioport\(\)](#).

Here is the caller graph for this function:

### 13.8.3.10 l4vbus\_request\_ioport()

```
int l4vbus_request_ioport (
    l4_cap_idx_t vbus,
    l4vbus_resource_t const * res )
```

Request an IO port resource.

#### Parameters

	<i>vbus</i>	Capability of the system bus.
in	<i>res</i>	The IO port resource to be requested from the bus.

#### Return values

0	Success.
-L4_EINVAL	Resource is not an IO port resource.
-L4_ENOENT	No matching IO port resource found.

If any IO port resource is found that contains the requested IO port range the IO ports are obtained.

Referenced by [L4vbus::Vbus::request\\_ioport\(\)](#).

Here is the caller graph for this function:

#### 13.8.3.11 l4vbus\_vicu\_get\_cap()

```
int l4vbus_vicu_get_cap (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t icu,
    l4_cap_idx_t cap )
```

Get capability of ICU.

##### Parameters

<i>vbus</i>	Capability of the system bus.
<i>icu</i>	ICU device handle.
<i>cap</i>	Capability slot for the capability.

##### Returns

0 on success, else failure

Referenced by [L4vbus::Icu::vicu\(\)](#).

Here is the caller graph for this function:

### 13.8.4 L4vbus GPIO functions

Collaboration diagram for L4vbus GPIO functions:

#### Enumerations

- enum `L4vbus_gpio_generic_func` { `L4VBUS_GPIO_SETUP_INPUT` = 0x100 , `L4VBUS_GPIO_SETUP_OUTPUT` = 0x200 , `L4VBUS_GPIO_SETUP_IRQ` = 0x300 }  
*Constants for generic GPIO functions.*
- enum `L4vbus_gpio_pull_modes` { `L4VBUS_GPIO_PIN_PULL_NONE` = 0x100 , `L4VBUS_GPIO_PIN_PULL_UP` = 0x200 , `L4VBUS_GPIO_PIN_PULL_DOWN` = 0x300 }  
*Constants for generic GPIO pull up/down resistor configuration.*

#### Functions

- int `l4vbus_gpio_setup` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned mode, int value)  
*Configure the function of a GPIO pin.*
- int `l4vbus_gpio_config_pull` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned mode)  
*Generic function to set pull up/down mode.*
- int `l4vbus_gpio_config_pad` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned func, unsigned value)  
*Hardware specific configuration function.*
- int `l4vbus_gpio_config_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned func, unsigned \*value)  
*Read hardware specific configuration.*
- int `l4vbus_gpio_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin)  
*Read value of GPIO input pin.*
- int `l4vbus_gpio_set` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, int value)  
*Set GPIO output pin.*
- int `l4vbus_gpio_multi_setup` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned mode, unsigned value)  
*Configure function of multiple GPIO pins at once.*
- int `l4vbus_gpio_multi_config_pad` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned func, unsigned value)  
*Hardware specific configuration function for multiple GPIO pins.*
- int `l4vbus_gpio_multi_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned \*data)  
*Read values of multiple GPIO pins at once.*
- int `l4vbus_gpio_multi_set` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned data)  
*Set multiple GPIO output pins at once.*
- int `l4vbus_gpio_to_irq` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin)  
*Create IRQ for GPIO pin.*

### 13.8.4.1 Detailed Description

### 13.8.4.2 Enumeration Type Documentation

#### 13.8.4.2.1 L4vbus\_gpio\_generic\_func

enum [L4vbus\\_gpio\\_generic\\_func](#)

Constants for generic GPIO functions.

##### Enumerator

L4VBUS_GPIO_SETUP_INPUT	Set GPIO pin to input.
L4VBUS_GPIO_SETUP_OUTPUT	Set GPIO pin to output.
L4VBUS_GPIO_SETUP_IRQ	Set GPIO pin to IRQ.

Definition at line 26 of file [vbus\\_gpio.h](#).

#### 13.8.4.2.2 L4vbus\_gpio\_pull\_modes

enum [L4vbus\\_gpio\\_pull\\_modes](#)

Constants for generic GPIO pull up/down resistor configuration.

##### Enumerator

L4VBUS_GPIO_PIN_PULL_NONE	No pull up or pull down resistors.
L4VBUS_GPIO_PIN_PULL_UP	enable pull up resistor
L4VBUS_GPIO_PIN_PULL_DOWN	enable pull down resistor

Definition at line 36 of file [vbus\\_gpio.h](#).

### 13.8.4.3 Function Documentation

#### 13.8.4.3.1 l4vbus\_gpio\_config\_get()

```
int l4vbus_gpio_config_get (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned func,
    unsigned * value )
```

Read hardware specific configuration.

##### Parameters

	<i>vbus</i>	V-BUS capability
--	-------------	------------------

## Parameters

	<i>handle</i>	Device handle for the GPIO chip
	<i>pin</i>	GPIO pin number
	<i>func</i>	Hardware specific configuration register to read from. Usually this is an offset to the GPIO chip's base address.
out	<i>value</i>	The configuration value.

## Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_pin::config\\_get\(\)](#).

Here is the caller graph for this function:

## 13.8.4.3.2 l4vbus\_gpio\_config\_pad()

```

int l4vbus_gpio_config_pad (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned func,
    unsigned value )
  
```

Hardware specific configuration function.

## Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pin

## Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_pin::config\\_pad\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.3 l4vbus\_gpio\_config\_pull()

```

int l4vbus_gpio_config_pull (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned mode )
  
```

Generic function to set pull up/down mode.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>mode</i>	mode for pull up/down resistors, see <a href="#">L4vbus_gpio_pull_modes</a>

##### Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_pin::config\\_pull\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.4 l4vbus\_gpio\_get()

```

int l4vbus_gpio_get (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin )
  
```

Read value of GPIO input pin.

## Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number to read from

## Returns

Value of GPIO pin (usually 0 or 1), negative error code otherwise.

Referenced by [L4vbus::Gpio\\_pin::get\(\)](#).

Here is the caller graph for this function:

## 13.8.4.3.5 l4vbus\_gpio\_multi\_config\_pad()

```

int l4vbus_gpio_multi_config_pad (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned func,
    unsigned value )
  
```

Hardware specific configuration function for multiple GPIO pins.

## Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>mask</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address.
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pins

## Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_module::config\\_pad\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.6 l4vbus\_gpio\_multi\_get()

```

int l4vbus_gpio_multi_get (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned * data )
  
```

Read values of multiple GPIO pins at once.

##### Parameters

	<i>vbus</i>	V-BUS capability
	<i>handle</i>	Device handle for the GPIO chip
	<i>offset</i>	Pin corresponding to the LSB in <i>data</i> . Note: allowed may be hardware specific.
out	<i>data</i>	Each bit returns the value (0 or 1) for the corresponding GPIO pin. The value of pins that are not accessible is undefined.

##### Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_module::get\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.7 l4vbus\_gpio\_multi\_set()

```
int l4vbus_gpio_multi_set (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned data )
```

Set multiple GPIO output pins at once.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>data</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to set. A bit set to 1 selects this pin. A maximum of 32 pins can be set at once. The real number depends on the hardware and the driver implementation.
<i>data</i>	Each bit corresponds to the GPIO pin in <i>mask</i> . The value of each bit is written to the GPIO pin if its bit in <i>mask</i> is set.

##### Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_module::set\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.8 l4vbus\_gpio\_multi\_setup()

```
int l4vbus_gpio_multi_setup (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned mode,
    unsigned value )
```

Configure function of multiple GPIO pins at once.

## Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>mask</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pins to if they are configured as output pins

## Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_module::setup\(\)](#).

Here is the caller graph for this function:

## 13.8.4.3.9 l4vbus\_gpio\_set()

```

int l4vbus_gpio_set (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    int value )

```

Set GPIO output pin.

## Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number to write to
<i>value</i>	Value to write to the GPIO pin (usually 0 or 1)

## Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_pin::set\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.10 l4vbus\_gpio\_setup()

```

int l4vbus_gpio_setup (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned mode,
    int value )
  
```

Configure the function of a GPIO pin.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pin to if it is configured as an output pin

##### Returns

0 if OK, error code otherwise

Referenced by [L4vbus::Gpio\\_pin::setup\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.11 l4vbus\_gpio\_to\_irq()

```
int l4vbus_gpio_to_irq (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin )
```

Create IRQ for GPIO pin.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin to create an IRQ for.

##### Returns

IRQ number if OK, negative error code otherwise

Referenced by [L4vbus::Gpio\\_pin::to\\_irq\(\)](#).

Here is the caller graph for this function:

### 13.8.5 L4vbus PCI functions

Collaboration diagram for L4vbus PCI functions:

## Functions

- `int l4vbus_pci_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)`  
*Read from the vPCI configuration space using the PCI root bridge.*
- `int l4vbus_pci_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)`  
*Write to the vPCI configuration space using the PCI root bridge.*
- `int l4vbus_pci_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, int pin, unsigned char *trigger, unsigned char *polarity)`  
*Enable PCI interrupt for a specific device using the PCI root bridge.*
- `int l4vbus_pcidev_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)`  
*Read from the device's vPCI configuration space.*
- `int l4vbus_pcidev_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)`  
*Write to the device's vPCI configuration space.*
- `int l4vbus_pcidev_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned char *trigger, unsigned char *polarity)`  
*Enable the device's PCI interrupt.*

### 13.8.5.1 Detailed Description

### 13.8.5.2 Function Documentation

#### 13.8.5.2.1 l4vbus\_pci\_cfg\_read()

```
int l4vbus_pci_cfg_read (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    l4_uint32_t reg,
    l4_uint32_t * value,
    l4_uint32_t width )
```

Read from the vPCI configuration space using the PCI root bridge.

#### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI root bridge
	<i>bus</i>	Bus number
	<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Referenced by [L4vbus::Pci\\_host\\_bridge::cfg\\_read\(\)](#).

Here is the caller graph for this function:

#### 13.8.5.2.2 l4vbus\_pci\_cfg\_write()

```
int l4vbus_pci_cfg_write (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    l4_uint32_t reg,
    l4_uint32_t value,
    l4_uint32_t width )
```

Write to the vPCI configuration space using the PCI root bridge.

##### Parameters

<i>vbus</i>	Capability of the system bus
<i>handle</i>	Device handle of the PCI root bridge
<i>bus</i>	Bus number
<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

**Returns**

0 on success, else failure

Referenced by [L4vbus::Pci\\_host\\_bridge::cfg\\_write\(\)](#).

Here is the caller graph for this function:

**13.8.5.2.3 l4vbus\_pci\_irq\_enable()**

```

int l4vbus_pci_irq_enable (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    int pin,
    unsigned char * trigger,
    unsigned char * polarity )
  
```

Enable PCI interrupt for a specific device using the PCI root bridge.

**Parameters**

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI root bridge
	<i>bus</i>	Bus number
	<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
	<i>pin</i>	Interrupt pin (normally as reported in configuration register INTR)
out	<i>trigger</i>	False if interrupt is level-triggered
out	<i>polarity</i>	True if interrupt is of low polarity

**Returns**

On success: Interrupt line to be used, else failure

Referenced by [L4vbus::Pci\\_host\\_bridge::irq\\_enable\(\)](#).

Here is the caller graph for this function:

#### 13.8.5.2.4 l4vbus\_pciddev\_cfg\_read()

```

int l4vbus_pciddev_cfg_read (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t reg,
    l4_uint32_t * value,
    l4_uint32_t width )
  
```

Read from the device's vPCI configuration space.

##### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI device
	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

##### Returns

0 on success, else failure

Referenced by [L4vbus::Pci\\_dev::cfg\\_read\(\)](#).

Here is the caller graph for this function:

### 13.8.5.2.5 l4vbus\_pciddev\_cfg\_write()

```
int l4vbus_pciddev_cfg_write (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t reg,
    l4_uint32_t value,
    l4_uint32_t width )
```

Write to the device's vPCI configuration space.

#### Parameters

<i>vbus</i>	Capability of the system bus
<i>handle</i>	Device handle of the PCI device
<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Referenced by [L4vbus::Pci\\_dev::cfg\\_write\(\)](#).

Here is the caller graph for this function:

### 13.8.5.2.6 l4vbus\_pciddev\_irq\_enable()

```
int l4vbus_pciddev_irq_enable (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned char * trigger,
    unsigned char * polarity )
```

Enable the device's PCI interrupt.

#### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI device
out	<i>trigger</i>	False if interrupt is level-triggered
out	<i>polarity</i>	True if interrupt is of low polarity

**Returns**

On success: Interrupt line to be used, else failure

Referenced by [L4vbus::Pci\\_dev::irq\\_enable\(\)](#).

Here is the caller graph for this function:

**13.8.6 L4vbus power management functions**

Collaboration diagram for L4vbus power management functions:

**Functions**

- `int l4vbus_pm_suspend (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)`  
*Suspend the device.*
- `int l4vbus_pm_resume (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)`  
*Resume the device.*

**13.8.6.1 Detailed Description****13.8.6.2 Function Documentation****13.8.6.2.1 l4vbus\_pm\_resume()**

```

int l4vbus_pm_resume (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle )
  
```

Resume the device.

**Parameters**

<i>vbus</i>	V-BUS capability
<i>handle</i>	Handle for the device to be resumed

Switches the device from low-power mode to normal operation and restores the saved state.

**Return values**

0	Success.
---	----------

Referenced by [L4vbus::Pm< DEC >::pm\\_resume\(\)](#).

Here is the caller graph for this function:

**13.8.6.2.2 l4vbus\_pm\_suspend()**

```
int l4vbus_pm_suspend (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle )
```

Suspend the device.

**Parameters**

<i>vbus</i>	V-BUS capability
<i>handle</i>	Handle for the device to be suspended

Saves the state of the device and puts it into a low-power mode.

**Return values**

0	Success.
---	----------

Referenced by [L4vbus::Pm< DEC >::pm\\_suspend\(\)](#).

*Unmap the given part of this data space from the DMA address space.*
- long `l4re_dma_space_associate` (`l4re_dma_space_t` dma, `l4_cap_idx_t` dma\_task, unsigned long attr) `L4_NOTHROW`  
*Associate a (kernel) DMA space for a device to this Dma\_space.*
- long `l4re_dma_space_disassociate` (`l4re_dma_space_t` dma)  
*Disassociate the (kernel) DMA space from this Dma\_space.*

### 13.9.3.1 Detailed Description

DMA Space C interface.

### 13.9.3.2 Typedef Documentation

#### 13.9.3.2.1 `l4re_dma_space_t`

```
typedef l4_cap_idx_t l4re_dma_space_t
```

DMA space capability type.

Managed DMA Address Space.

A managed `Dma_space` represents the [L4Re](#) abstraction of an DMA address space of one or several devices. Devices are assigned to a managed `Dma_space` by binding the `Dma_space` to the respective DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)), which might link the `Dma_space` with a kernel [DMA space](#). Note that several DMA domains can be bound to the same `Dma_space`. Whenever a device needs direct access to parts of an [L4Re::Dataspace](#), that part of the data space must be mapped to the managed `Dma_space` that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.

Mapping to a managed DMA address space, using `map()`, makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping. Additionally, `map()` is responsible for the necessary syncing operations before the DMA.

`unmap()` is the reverse operation to `map()` and unmaps the given data-space part for the DMA address space. `unmap()` is responsible for the necessary sync operations after the DMA.

Definition at line 59 of file [dma\\_space.h](#).

### 13.9.3.3 Function Documentation

#### 13.9.3.3.1 `l4re_dma_space_associate()`

```
long l4re_dma_space_associate (
    l4re_dma_space_t dma,
    l4_cap_idx_t dma_task,
    unsigned long attr )
```

Associate a (kernel) [DMA space](#) for a device to this `Dma_space`.

## Parameters

	<i>dma</i>	DMA space capability
in	<i>dma_task</i>	The (kernel) <a href="#">DMA space</a> used for the device that shall be associated with this DMA space. In case no IOMMU is present or configured, the <i>dma_task</i> might be an invalid capability when <a href="#">L4Re::Dma_space::Phys_space</a> is set in <i>attr</i> , in this case the CPUs physical memory is used as DMA address space.
in	<i>attr</i>	Attributes for this DMA space. See <a href="#">L4Re::Dma_space::Space_attrib</a> .

## Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the <i>Dma_space</i> capability.
<i>-L4_EINVAL</i>	
<i>-L4_ENOENT</i>	

## Precondition

requires capability rights: {RW}

13.9.3.3.2 [l4re\\_dma\\_space\\_disassociate\(\)](#)

```
long l4re_dma_space_disassociate (
    l4re\_dma\_space\_t dma )
```

Disassociate the (kernel) [DMA space](#) from this *Dma\_space*.

## Parameters

<i>dma</i>	DMA space capability
------------	----------------------

## Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the <i>Dma_space</i> capability.
<i>-L4_ENOENT</i>	

## Precondition

requires capability rights: {RW}

13.9.3.3.3 [l4re\\_dma\\_space\\_map\(\)](#)

```
long l4re_dma_space_map (
    l4re\_dma\_space\_t dma,
    l4re\_ds\_t src,
```

```

l4re_ds_offset_t offset,
l4_size_t * size,
unsigned long attrs,
enum l4re_dma_space_direction dir,
l4re_dma_space_dma_addr_t * dma_addr )

```

Map the given part of this data space into the DMA address space.

#### Parameters

	<i>dma</i>	DMA space capability
in	<i>src</i>	Source data space (that describes the memory). Caller needs write right to the data space.
in	<i>offset</i>	The offset (bytes) within <i>src</i> .
in, out	<i>size</i>	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call <code>map()</code> again with a new offset and the remaining size.
in	<i>attrs</i>	The attributes used for this DMA mapping (a combination of <code>Dma_space::Attribute</code> values).
in	<i>dir</i>	The direction of the DMA transfer issued with this mapping. The same value must later be passed to <code>unmap()</code> .
out	<i>dma_addr</i>	The DMA address to use for DMA with the associated device.

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <code>L4_CAP_FPAGE_W</code> right on <i>src</i> capability.
<i>-L4_EINVAL</i>	The <i>src</i> capability is invalid or does not refer to a valid dataspace.
<i>-L4_EEXIST</i>	The specified region overlaps an existing mapping.
<i>-L4_ENOMEM</i>	Not enough memory to allocate internal datastructures.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.

#### Precondition

requires capability rights: {R}

#### Note

`associate()` must be called prior to mapping memory. Usually this is done implicitly when binding the managed `Dma_space` to a DMA domain (see `L4vbus::Vbus::assign_dma_domain()`).

#### 13.9.3.3.4 l4re\_dma\_space\_unmap()

```

long l4re_dma_space_unmap (
    l4re_dma_space_t dma,
    l4re_dma_space_dma_addr_t dma_addr,
    l4_size_t size,
    unsigned long attrs,
    enum l4re_dma_space_direction dir )

```

Unmap the given part of this data space from the DMA address space.

**Parameters**

<i>dma</i>	DMA space capability
<i>dma_addr</i>	The DMA address (returned by <code>Dma_space::map()</code> ).
<i>size</i>	The size (bytes) of the memory region to unmap.
<i>attrs</i>	The attributes for the unmap (currently none).
<i>dir</i>	The direction of the finished DMA operation.

**Returns**

0 in the case of success, a negative error code otherwise.

**Precondition**

requires capability rights: {R}

enum l4re\_ds\_map\_flags
```

Flags to specify the memory mapping type of a request.

Enumerator

<a href="#">L4RE_DS_F_NORMAL</a>	request normal memory mapping
<a href="#">L4RE_DS_F_CACHEABLE</a>	request normal memory mapping
<a href="#">L4RE_DS_F_BUFFERABLE</a>	request bufferable (write buffered) mappings
<a href="#">L4RE_DS_F_UNCACHEABLE</a>	request uncacheable memory mappings
<a href="#">L4RE_DS_F_CACHING_MASK</a>	mask for caching flags
<a href="#">L4RE_DS_F_CACHING_SHIFT</a>	shift value for caching flags

Definition at line 58 of file [dataspace.h](#).

### 13.9.4.3 Function Documentation

#### 13.9.4.3.1 l4re\_ds\_allocate()

```
long l4re\_ds\_allocate (  
    l4re\_ds\_t ds,
```

```

l4re_ds_offset_t offset,
l4re_ds_size_t size )

```

Allocate a range in the dataspace.

#### Parameters

<i>ds</i>	Dataspace capability.
<i>offset</i>	Offset in the dataspace, in bytes.
<i>size</i>	Size of the range, in bytes.

#### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<i>-L4_ENOMEM</i>	Not enough memory available.
<i>&lt;0</i>	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.

The memory is allocated with the same rights as the dataspace capability.

#### 13.9.4.3.2 l4re\_ds\_clear()

```

long l4re_ds_clear (
    l4re_ds_t ds,
    l4re_ds_offset_t offset,
    l4re_ds_size_t size )

```

Clear parts of a dataspace.

#### Parameters

<i>ds</i>	Dataspace capability.
<i>offset</i>	Offset within dataspace (in bytes).
<i>size</i>	Size of region to clear (in bytes).

#### Return values

<i>&gt;=0</i>	Success.
<i>-L4_ERANGE</i>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<i>-L4_EACCESS</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on dataspace capability.
<i>&lt;0</i>	IPC errors

Zeroes out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.

**13.9.4.3.3 l4re\_ds\_copy\_in()**

```
int l4re_ds_copy_in (
    l4re_ds_t ds,
    l4re_ds_offset_t dst_offs,
    l4re_ds_t src,
    l4re_ds_offset_t src_offs,
    l4re_ds_size_t size )
```

Copy contents from another dataspace.

**Parameters**

<i>ds</i>	Destination dataspace.
<i>dst_offs</i>	Offset in destination dataspace.
<i>src</i>	Source dataspace to copy from.
<i>src_offs</i>	Offset in the source dataspace.
<i>size</i>	Size to copy (in bytes).

**Return values**

<i>L4_EOK</i>	Success
<i>-L4_EACCESS</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the destination dataspace.
<i>-L4_EINVAL</i>	Invalid parameter supplied.
<i>&lt;0</i>	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspace managers do not cooperate.

**13.9.4.3.4 l4re\_ds\_flags()**

```
l4re_ds_flags_t l4re_ds_flags (
    l4re_ds_t ds )
```

Get flags of the dataspace.

**Parameters**

<i>ds</i>	Dataspace capability.
-----------	-----------------------

**Return values**

<i>&gt;=0</i>	Flags of the dataspace
<i>&lt;0</i>	IPC errors

See also

[L4Re::Dataspace::F::Flags](#)

### 13.9.4.3.5 l4re\_ds\_info()

```
int l4re_ds_info (
    l4re_ds_t ds,
    l4re_ds_stats_t * stats )
```

Get information on the dataspace.

#### Parameters

	<i>ds</i>	Dataspace capability.
out	<i>stats</i>	Dataspace information

#### Return values

0	Success
<0	IPC errors

### 13.9.4.3.6 l4re\_ds\_map\_info()

```
int l4re_ds_map_info (
    l4re_ds_t ds,
    l4_addr_t * start_addr,
    l4_addr_t * end_addr )
```

Get mapping range of dataspace.

#### Parameters

<i>ds</i>	Dataspace capability.
-----------	-----------------------

In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.

On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

#### Parameters

out	<i>start_addr</i>	Start address of dataspace.
out	<i>end_addr</i>	End address (inclusive) of dataspace.

#### Return values

>0	Start/end address have been set and need to be obeyed.
0	No constraint of mapping address.
-L4_EPERM	Cannot infer mapping address. Dataspace not mappable.
<0	IPC errors.

### 13.9.4.3.7 l4re\_ds\_size()

```
l4re_ds_size_t l4re_ds_size (
    l4re_ds_t ds )
```

Get size of a dataspace.

#### Parameters

<i>ds</i>	Dataspace capability.
-----------	-----------------------

#### Returns

Size of the dataspace in bytes.

## 13.9.5 Debug interface

Collaboration diagram for Debug interface:

### Functions

- long [l4re\\_debug\\_obj\\_debug](#) ([l4\\_cap\\_idx\\_t](#) *srv*, unsigned long *function*) [L4\\_NOTHROW](#)  
Call debug function of [L4Re](#) service.

#### 13.9.5.1 Detailed Description

#### 13.9.5.2 Function Documentation

##### 13.9.5.2.1 l4re\_debug\_obj\_debug()

```
long l4re_debug_obj_debug (
    l4_cap_idx_t srv,
    unsigned long function )
```

Call debug function of [L4Re](#) service.

#### Parameters

<i>srv</i>	Object to call.
<i>function</i>	Function to call.

See also

[L4Re::Debug\\_obj::debug](#)

### 13.9.6 Event interface

Event C interface.

Collaboration diagram for Event interface:

#### Functions

- long [l4re\\_event\\_get\\_buffer](#) (const [l4\\_cap\\_idx\\_t](#) server, const [l4re\\_ds\\_t](#) ds) [L4\\_NOTHROW](#)  
*Get an event signal buffer.*
- long [l4re\\_event\\_get\\_num\\_streams](#) (const [l4\\_cap\\_idx\\_t](#) server) [L4\\_NOTHROW](#)  
*Get number of streams.*
- long [l4re\\_event\\_get\\_stream\\_info](#) (const [l4\\_cap\\_idx\\_t](#) server, int idx, [l4re\\_event\\_stream\\_info\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get information on a stream.*
- long [l4re\\_event\\_get\\_stream\\_info\\_for\\_id](#) (const [l4\\_cap\\_idx\\_t](#) server, [l4\\_umword\\_t](#) stream\_id, [l4re\\_event\\_stream\\_info\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get info for a stream given a stream id.*
- long [l4re\\_event\\_get\\_axis\\_info](#) (const [l4\\_cap\\_idx\\_t](#) server, [l4\\_umword\\_t](#) id, unsigned naxes, unsigned const \*axis, [l4re\\_event\\_absinfo\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get Axis information for a stream.*

#### 13.9.6.1 Detailed Description

Event C interface.

#### 13.9.6.2 Function Documentation

##### 13.9.6.2.1 l4re\_event\_get\_axis\_info()

```

long l4re_event_get_axis_info (
    const l4\_cap\_idx\_t server,
    l4\_umword\_t id,
    unsigned naxes,
    unsigned const * axis,
    l4re\_event\_absinfo\_t * info )
  
```

Get Axis information for a stream.

## Parameters

	<i>server</i>	Server to talk to.
	<i>id</i>	Id of the stream to get information from.
	<i>naxes</i>	Number of axes in <i>axis</i> array.
in	<i>axis</i>	Array of axis IDs whose information should be retrieved.
out	<i>info</i>	Information buffer to store the retrieved axis infos.

## Return values

0	Success
<0	Error

## See also

[L4Re::Event::get\\_axis\\_info](#)**13.9.6.2.2 l4re\_event\_get\_buffer()**

```
long l4re_event_get_buffer (
    const l4_cap_idx_t server,
    const l4re_ds_t ds )
```

Get an event signal buffer.

## Parameters

<i>server</i>	Server to talk to.
<i>ds</i>	Buffer to event data.

## Returns

0 for success, <0 on error

## See also

[L4Re::Event::get\\_buffer](#)**13.9.6.2.3 l4re\_event\_get\_num\_streams()**

```
long l4re_event_get_num_streams (
    const l4_cap_idx_t server )
```

Get number of streams.

## Parameters

<i>server</i>	Server to talk to.
---------------	--------------------

**Returns**

0 for success, <0 on error

**See also**

[L4Re::Event::get\\_num\\_streams](#)

**13.9.6.2.4 l4re\_event\_get\_stream\_info()**

```
long l4re_event_get_stream_info (
    const l4_cap_idx_t server,
    int idx,
    l4re_event_stream_info_t * info )
```

Get information on a stream.

**Parameters**

	<i>server</i>	Server to talk to.
	<i>idx</i>	Index value.
out	<i>info</i>	Information buffer.

**Returns**

0 for success, <0 on error

**See also**

[L4Re::Event::get\\_stream\\_info](#)

**13.9.6.2.5 l4re\_event\_get\_stream\_info\_for\_id()**

```
long l4re_event_get_stream_info_for_id (
    const l4_cap_idx_t server,
    l4_umword_t stream_id,
    l4re_event_stream_info_t * info )
```

Get info for a stream given a stream id.

**Parameters**

	<i>server</i>	Server to talk to.
	<i>stream_id</i>	Stream ID.
out	<i>info</i>	Information buffer.

**Returns**

0 for success, <0 on error

**See also**

[L4Re::Event::get\\_stream\\_info\\_for\\_id](#)

**13.9.7 Initial Environment**

C interface of the initial environment that is provided to an [L4](#) task.

Collaboration diagram for Initial Environment:

**Data Structures**

- struct [l4re\\_env\\_cap\\_entry\\_t](#)  
*Entry in the [L4Re](#) environment array for the named initial objects.*

**Typedefs**

- typedef struct [l4re\\_env\\_cap\\_entry\\_t](#) [l4re\\_env\\_cap\\_entry\\_t](#)  
*Entry in the [L4Re](#) environment array for the named initial objects.*

**Functions**

- [l4re\\_env\\_t](#) \* [l4re\\_env](#) (void) [L4\\_NOTHROW](#)  
*Get [L4Re](#) initial environment.*
- [l4\\_kernel\\_info\\_t](#) const \* [l4re\\_kip](#) (void) [L4\\_NOTHROW](#)  
*Get Kernel Info Page.*
- [l4\\_cap\\_idx\\_t](#) [l4re\\_env\\_get\\_cap](#) (char const \*name) [L4\\_NOTHROW](#)  
*Get the capability selector for the object named name.*
- [l4\\_cap\\_idx\\_t](#) [l4re\\_env\\_get\\_cap\\_e](#) (char const \*name, [l4re\\_env\\_t](#) const \*e) [L4\\_NOTHROW](#)  
*Get the capability selector for the object named name.*
- [l4re\\_env\\_cap\\_entry\\_t](#) const \* [l4re\\_env\\_get\\_cap\\_l](#) (char const \*name, unsigned l, [l4re\\_env\\_t](#) const \*e) [L4\\_NOTHROW](#)  
*Get the full [l4re\\_env\\_cap\\_entry\\_t](#) for the object named name.*

### 13.9.7.1 Detailed Description

C interface of the initial environment that is provided to an [L4](#) task.

#### Include File

```
#include <l4/re/env.h>
```

For an explanation of the default task capabilities see [l4\\_default\\_caps\\_t](#).

For the C++ interface refer to [L4Re::Env](#).

### 13.9.7.2 Function Documentation

#### 13.9.7.2.1 l4re\_env()

```
l4re_env_t * l4re_env (
    void ) [inline]
```

Get [L4Re](#) initial environment.

#### Returns

Pointer to [L4Re](#) initial environment.

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#),  
and [examples/sys/utcb-ipc/main.c](#).

Definition at line [190](#) of file [env.h](#).

Referenced by [l4re\\_env\\_get\\_cap\(\)](#).

Here is the caller graph for this function:

#### 13.9.7.2.2 l4re\_env\_get\_cap()

```
l4_cap_idx_t l4re_env_get_cap (
    char const * name ) [inline]
```

Get the capability selector for the object named *name*.

## Parameters

<i>name</i>	is the name of the object to lookup in the initial objects.
-------------	---

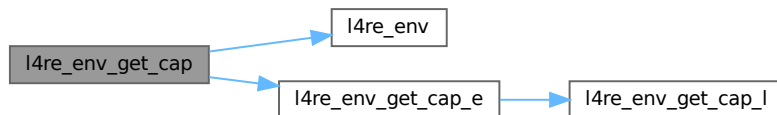

## Returns

A valid capability selector if the object exists or an invalid capability selector if not ([l4\\_is\\_invalid\\_cap\(\)](#)).

Definition at line 229 of file [env.h](#).

References [l4re\\_env\(\)](#), and [l4re\\_env\\_get\\_cap\\_e\(\)](#).

Here is the call graph for this function:

## 13.9.7.2.3 l4re\_env\_get\_cap\_e()

```

l4_cap_idx_t l4re_env_get_cap_e (
    char const * name,
    l4re_env_t const * e ) [inline]
  
```

Get the capability selector for the object named *name*.

## Parameters

<i>name</i>	is the name of the object to lookup in the initial objects.
<i>e</i>	is the environment structure to use for the operation.

## Returns

A valid capability selector if the object exists or an invalid capability selector if not ([l4\\_is\\_invalid\\_cap\(\)](#)).

Definition at line 216 of file [env.h](#).

References [l4re\\_env\\_cap\\_entry\\_t::cap](#), [L4\\_INVALID\\_CAP](#), and [l4re\\_env\\_get\\_cap\\_l\(\)](#).

Referenced by [l4re\\_env\\_get\\_cap\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.9.7.2.4 l4re\_env\_get\_cap\_l()

```

l4re_env_cap_entry_t const * l4re_env_get_cap_l (
    char const * name,
    unsigned l,
    l4re_env_t const * e ) [inline]
  
```

Get the full [l4re\\_env\\_cap\\_entry\\_t](#) for the object named *name*.

##### Parameters

<i>name</i>	is the name of the object to lookup in the initial objects.
<i>l</i>	is the length of the name string, thus <i>name</i> might not be zero terminated.
<i>e</i>	is the environment structure to use for the operation.

##### Returns

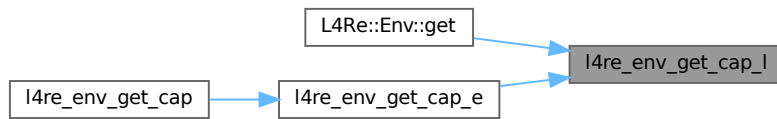

A pointer to an [l4re\\_env\\_cap\\_entry\\_t](#) if the object exists or NULL if not.

Definition at line 198 of file [env.h](#).

References [l4re\\_env\\_cap\\_entry\\_t::flags](#), and [l4re\\_env\\_cap\\_entry\\_t::name](#).

Referenced by [L4Re::Env::get\(\)](#), and [l4re\\_env\\_get\\_cap\\_e\(\)](#).

Here is the caller graph for this function:

#### 13.9.7.2.5 l4re\_kip()

```
l4_kernel_info_t const * l4re_kip (
    void ) [inline]
```

Get Kernel Info Page.

##### Returns

Pointer to Kernel Info Page (KIP) structure.

##### Examples

[examples/libs/shmc/prodcons.c](#), [examples/sys/aliens/main.c](#), and [examples/sys/ux-vhw/main.c](#).

Definition at line 194 of file [env.h](#).

References [l4\\_kip\(\)](#).

Referenced by [L4::Poll\\_timeout\\_kipclock::set\(\)](#), and [L4::Poll\\_timeout\\_kipclock::test\(\)](#).

Here is the caller graph for this function:

### 13.9.8 Kumem allocator utility

Kumem allocator utility C interface.

Collaboration diagram for Kumem allocator utility:

Kumem allocator utility C interface.

### 13.9.9 L4Re Util C Interface

Documentation of the [L4](#) Runtime Environment utility functionality in C.

Collaboration diagram for L4Re Util C Interface:

Documentation of the [L4](#) Runtime Environment utility functionality in C.

The interface functions closely align with the C++ functions and add no further functionalities.

For new programs it is advised to use the C++ interface.

### 13.9.10 Log interface

Log C interface.

Collaboration diagram for Log interface:

## Functions

- void [l4re\\_log\\_print](#) (char const \*string) [L4\\_NOTHROW](#)  
*Write a null terminated string to the default log.*
- void [l4re\\_log\\_printn](#) (char const \*string, int len) [L4\\_NOTHROW](#)  
*Write a string of a given length to the default log.*
- void [l4re\\_log\\_print\\_srv](#) (const [l4\\_cap\\_idx\\_t](#) logcap, char const \*string) [L4\\_NOTHROW](#)  
*Write a null terminated string to a log.*
- void [l4re\\_log\\_printn\\_srv](#) (const [l4\\_cap\\_idx\\_t](#) logcap, char const \*string, int len) [L4\\_NOTHROW](#)  
*Write a string of a given length to a log.*

### 13.9.10.1 Detailed Description

Log C interface.

### 13.9.10.2 Function Documentation

#### 13.9.10.2.1 l4re\_log\_print()

```
void l4re_log_print (
    char const * string ) [inline]
```

Write a null terminated string to the default log.

#### Parameters

<i>string</i>	Text to print, null terminated.
---------------	---------------------------------

#### See also

[L4Re::Log::print](#)

Definition at line 91 of file [log.h](#).

References [l4re\\_log\\_print\\_srv\(\)](#), and [l4re\\_env\\_t::log](#).

Here is the call graph for this function:

### 13.9.10.2.2 l4re\_log\_print\_srv()

```
void l4re_log_print_srv (
    const l4_cap_idx_t logcap,
    char const * string )
```

Write a null terminated string to a log.

#### Parameters

<i>logcap</i>	Log capability (service).
<i>string</i>	Text to print, null terminated.

#### See also

[L4Re::Log::print](#)

Referenced by [l4re\\_log\\_print\(\)](#).

Here is the caller graph for this function:

### 13.9.10.2.3 l4re\_log\_printn()

```
void l4re_log_printn (
    char const * string,
    int len ) [inline]
```

Write a string of a given length to the default log.

#### Parameters

<i>string</i>	Text to print, null terminated.
<i>len</i>	Length of string in bytes.

#### See also

[L4Re::Log::println](#)

Definition at line 97 of file [log.h](#).

References [l4re\\_log\\_printn\\_srv\(\)](#), and [l4re\\_env\\_t::log](#).

Here is the call graph for this function:

#### 13.9.10.2.4 l4re\_log\_printn\_srv()

```

void l4re_log_printn_srv (
    const l4_cap_idx_t logcap,
    char const * string,
    int len )
  
```

Write a string of a given length to a log.

##### Parameters

<i>logcap</i>	Log capability (service).
<i>string</i>	Text to print, null terminated.
<i>len</i>	Length of string in bytes.

##### See also

[L4Re::Log::printn](#)

Referenced by [l4re\\_log\\_printn\(\)](#).

### 13.9.11 Memory allocator

Memory allocator C interface.

Collaboration diagram for Memory allocator:

## Enumerations

- enum [l4re\\_ma\\_flags](#)  
*Flags for requesting memory at the memory allocator.*

## Functions

- long [l4re\\_ma\\_alloc](#) (long size, [l4re\\_ds\\_t](#) const mem, unsigned long flags) [L4\\_NOTHROW](#)  
*Allocate memory.*
- long [l4re\\_ma\\_alloc\\_align](#) (long size, [l4re\\_ds\\_t](#) const mem, unsigned long flags, unsigned long align) [L4\\_NOTHROW](#)  
*Allocate memory.*
- long [l4re\\_ma\\_alloc\\_align\\_srv](#) ([l4\\_cap\\_idx\\_t](#) srv, long size, [l4re\\_ds\\_t](#) const mem, unsigned long flags, unsigned long align) [L4\\_NOTHROW](#)  
*Allocate memory.*

### 13.9.11.1 Detailed Description

Memory allocator C interface.

### 13.9.11.2 Enumeration Type Documentation

#### 13.9.11.2.1 l4re\_ma\_flags

```
enum l4re\_ma\_flags
```

Flags for requesting memory at the memory allocator.

See also

[L4Re::Mem\\_alloc::Mem\\_alloc\\_flags](#)

Definition at line 42 of file [mem\\_alloc.h](#).

### 13.9.11.3 Function Documentation

#### 13.9.11.3.1 l4re\_ma\_alloc()

```
long l4re\_ma\_alloc (
    long size,
    l4re\_ds\_t const mem,
    unsigned long flags ) [inline]
```

Allocate memory.

## Parameters

<i>size</i>	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if <i>size</i> is a negative value and <i>flags</i> set the <code>Mem_alloc_flags::Continuous</code> bit, the allocator tries to allocate as much memory as possible leaving an amount of at least <code>-size</code> bytes within the associated quota.
<i>mem</i>	Capability slot where the capability to the dataspace is received.
<i>flags</i>	Special dataspace properties, see <a href="#">l4re_ma_flags</a>

## Return values

0	Success
-L4_ERANGE	Given size not supported.
-L4_ENOMEM	Not enough memory available.
<0	IPC error

## See also

[L4Re::Mem\\_alloc::alloc](#)

The memory allocator returns a dataspace.

## Note

This function is using the [L4Re::Env::env\(\)](#)->`mem_alloc()` service.

## Examples

[examples/libs/l4re/c/ma+rm.c](#).

Definition at line 146 of file [mem\\_alloc.h](#).

References [l4re\\_ma\\_alloc\\_align\\_srv\(\)](#), and [l4re\\_env\\_t::mem\\_alloc](#).

Here is the call graph for this function:

## 13.9.11.3.2 l4re\_ma\_alloc\_align()

```

long l4re_ma_alloc_align (
    long size,
    l4re_ds_t const mem,
    unsigned long flags,
    unsigned long align ) [inline]
  
```

Allocate memory.

## Parameters

<i>size</i>	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if <i>size</i> is a negative value and <i>flags</i> set the <code>Mem_alloc_flags::Continuous</code> bit, the allocator tries to allocate as much memory as possible leaving an amount of at least <code>-size</code> bytes within the associated quota.
<i>mem</i>	Capability slot where the capability to the dataspace is received.
<i>flags</i>	Special dataspace properties, see <a href="#">l4re_ma_flags</a>
<i>align</i>	Log2 alignment of dataspace if supported by allocator, will be at least <code>L4_PAGESHIFT</code> , with <code>Super_pages</code> flag set at least <code>L4_SUPERPAGESHIFT</code>

## Return values

<code>0</code>	Success
<code>-L4_ERANGE</code>	Given size not supported.
<code>-L4_ENOMEM</code>	Not enough memory available.
<code>&lt;0</code>	IPC error

## See also

[L4Re::Mem\\_alloc::alloc](#) and

### 13.9.12.3 Function Documentation

#### 13.9.12.3.1 [l4re\\_ns\\_query\\_srv\(\)](#)

```
long l4re\_ns\_query\_srv (  
    l4re\_namespace\_t srv,  
    char const * name,  
    l4\_cap\_idx\_t const cap ) [inline]
```

Query the name space for the object named by name.

## Parameters

<i>srv</i>	Name space server to use for the query.
<i>name</i>	String to query.
<i>cap</i>	Capability slot where the received capability will be stored.

## Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.
<0	IPC errors, see <a href="#">l4_error_code_t</a> .

Definition at line 105 of file [namespace.h](#).

## 13.9.12.3.2 l4re\_ns\_query\_to\_srv()

```

long l4re_ns_query_to_srv (
    l4re_namespace_t srv,
    char const * name,
    l4_cap_idx_t const cap,
    int timeout )
  
```

Query the name space for the object named by *name*.

## Parameters

<i>timeout</i>	Timeout of query in milliseconds. The client will only wait if a name already has been registered with the server but no object has been attached yet.
<i>srv</i>	Name space server to use for the query.
<i>name</i>	String to query.
<i>cap</i>	Capability slot where the received capability will be stored.

## Return values

<i>0</i>	Name could be fully resolved.
<i>&gt;0</i>	Name could only be partly resolved. The number of remaining characters is returned.
<i>-L4_ENOENT</i>	Entry could not be found.
<i>-L4_EAGAIN</i>	Entry exists but no object is yet attached. Try again later.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

Referenced by [l4re\\_ns\\_query\\_srv\(\)](#).

### 13.9.12.3.3 l4re\_ns\_register\_obj\_srv()

```

long l4re_ns_register_obj_srv (
    l4re_namespace_t srv,
    char const * name,
    l4_cap_idx_t const obj,
    unsigned flags )
  
```

Register an object with a name.

## Parameters

<i>srv</i>	Name space server to use for the query.
<i>name</i>	Name under which the object should be registered.
<i>obj</i>	Capability to object to register. An invalid capability may be given to only reserve the name for later use.
<i>flags</i>	Flags to assign to the entry, see <a href="#">L4Re::Namespace::Register_flags</a> . Note that the rights that are assigned to a capability are not only determined by the rights given in these flags but also by the rights with which the <code>obj</code> capability was mapped to the name space.

## Return values

<i>0</i>	Object was successfully registered with <i>name</i> .
<i>-L4_EEXIST</i>	Name already registered.
<i>-L4_EPERM</i>	Caller does not have <a href="#">L4_CAP_FPAGE_W</a> right on the invoked capability.
<i>-L4_ENOMEM</i>	Server has insufficient resources.
<i>-L4_EINVAL</i>	Invalid parameter.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

### 13.9.14.1 Detailed Description

Region map C interface.

### 13.9.14.2 Enumeration Type Documentation

#### 13.9.14.2.1 l4re\_rm\_flags\_values

```
enum l4re_rm_flags_values
```

Flags for region operations.

#### Enumerator

L4RE_RM_F_R	Region is read-only.
L4RE_RM_F_NO_ALIAS	The region contains exclusive memory that is not mapped anywhere else.
L4RE_RM_F_PAGER	Region has a pager.

## Enumerator

L4RE_RM_F_RESERVED	Region is reserved (blocked)
L4RE_RM_CACHING_SHIFT	Start of region mapper cache bits.
L4RE_RM_F_CACHING	Mask of all region manager cache bits.
L4RE_RM_REGION_FLAGS	Mask of all region flags.
L4RE_RM_F_CACHE_NORMAL	Cache bits for normal cacheable memory.
L4RE_RM_F_CACHE_BUFFERED	Cache bits for buffered (write combining) memory.
L4RE_RM_F_CACHE_UNCACHED	Cache bits for uncached memory.
L4RE_RM_F_SEARCH_ADDR	Search for a suitable address range.
L4RE_RM_F_IN_AREA	Search only in area, or map into area.
L4RE_RM_F_EAGER_MAP	Eagerly map the attached data space in.
L4RE_RM_F_NO_EAGER_MAP	Prevent eager mapping of the attached data space.
L4RE_RM_F_ATTACH_FLAGS	Mask of all attach flags.

Definition at line 40 of file [rm.h](#).

## 13.9.14.3 Function Documentation

13.9.14.3.1 `l4re_rm_attach()`

```
int l4re_rm_attach (
    void ** start,
    unsigned long size,
    l4re_rm_flags_t flags,
    l4re_ds_t mem,
    l4re_rm_offset_t offs,
    unsigned char align ) [inline]
```

Attach a data space to a region.

## Parameters

<code>in, out</code>	<code>start</code>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<code>size</code>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	<code>flags</code>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <code>F::Eager_map</code> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<code>mem</code>	Data space.
	<code>offs</code>	Offset into the data space to use.
	<code>align</code>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.
	<code>task</code>	Optional destination task of mapping if <code>F::Eager_map</code> flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.

## Return values

0	Success
-L4_ENOENT	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

## Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see [L4Re::Rm::find](#)).

## See also

[L4Re::Rm::attach](#)

This function is using the `L4::Env::env()->rm()` service.

## Examples

Here is the caller graph for this function:

### 13.9.14.3.3 l4re\_rm\_detach()

```
int l4re_rm_detach (
    void * addr ) [inline]
```

Detach and unmap a region from the address space in the current task.

Parameters

<i>addr</i>	Address of the region to detach.
-------------	----------------------------------

Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees a region in the virtual address space given by *addr*. The corresponding part of the address space is now available again.

Also

See also

[L4Re::Rm::detach](#)

This function is using the `L4::Env::env()->rm()` service.

Definition at line 297 of file `rm.h`.

```
int l4re_rm_detach_ds (
    void * addr,
    l4re_ds_t * ds ) [inline]
```

Detach and unmap a region and return affected dataspace in the current task.

##### Parameters

	<i>addr</i>	Address of the region to detach.
out	<i>ds</i>	Returns dataspace that is affected.

##### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees a region in the virtual address space given by `addr`. The corresponding part of the address space is now available again.

## 13.9.14.3.8 l4re\_rm\_find()

```

int l4re_rm_find (
    l4_addr_t * addr,
    unsigned long * size,
    l4re_rm_offset_t * offset,
    l4re_rm_flags_t * flags,
    l4re_ds_t * m ) [inline]
  
```

Find a region given an address and size.

## Parameters

in, out	<i>addr</i>	Address to look for. Returns the start address of the found region.
in, out	<i>size</i>	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	<i>offset</i>	Offset at the beginning of the region within the associated dataspace.
out	<i>flags</i>	Region flags, see <code>F::Region_flags</code> (and <code>F::In_area</code> ).
out	<i>m</i>	Associated dataspace or paging service.

## Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the `addr` and `size` parameter. If no such region is found but a reserved area, the area is returned and `F::ln_area` is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

## Note

The value of the size input parameter should be 1 to assure that a region can be determined unambiguously.

### 13.9.14.3.10 l4re\_rm\_free\_area()

```
int l4re_rm_free_area (
    l4_addr_t addr ) [inline]
```

Free an area from the region map.

Parameters

<i>addr</i>	An address within the area to free.
-------------	-------------------------------------

Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

Note

The data spaces that are attached to that area are not detached by this operation.

## See also

`reserve_area()` for more information about areas.

```
int l4re_rm_free_area_srv (
    l4_cap_idx_t rm,
    l4_addr_t addr )
```

## See also

[L4Re::Rm::free\\_area](#)

Referenced by [l4re\\_rm\\_free\\_area\(\)](#).

Here is the caller graph for this function:

### 13.9.14.3.12 l4re\_rm\_reserve\_area()

```
int l4re_rm_reserve_area (
    l4_addr_t * start,
    unsigned long size,
    l4re_rm_flags_t flags,
    unsigned char align ) [inline]
```

Reserve the given area in the region map.

## Parameters

<code>in, out</code>	<code>start</code>	The virtual start address of the area to reserve. Returns the start address of the area.
	<code>size</code>	The size of the area to reserve (in bytes).
	<code>flags</code>	Flags for the reserved area (see <a href="#">L4Re::Rm::F::Region_flags</a> and <a href="#">L4Re::Rm::F::Attach_flags</a> ).
	<code>align</code>	Alignment of area if searched as bits (log2 value).

## Return values

<code>0</code>	Success
<code>-L4_EADDRNOTAVAIL</code>	The given area cannot be reserved.
<code>&lt;0</code>	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (`flags = L4Re::Rm::F::Reserved`), where no data spaces can be attached
- Special purpose areas (`flags = 0`), where data spaces can be attached to the area via the [L4Re::Rm::F::In\\_area](#) flag and a start address within the area itself.

## Note

When searching for a free place in the virtual address space (with `flags = L4Re::Rm::F::Search\_addr`), the space between `start` and the end of the virtual address space is searched.

## Functions

- `int l4re_video_goos_info (l4re_video_goos_t goos, l4re_video_goos_info_t *ginfo) L4_NOTHROW`  
*Get information on a goos.*
- `int l4re_video_goos_refresh (l4re_video_goos_t goos, int x, int y, int w, int h) L4_NOTHROW`  
*Flush a rectangle of pixels of the goos screen.*
- `int l4re_video_goos_create_buffer (l4re_video_goos_t goos, unsigned long size, l4_cap_idx_t buffer) L4_NOTHROW`  
*Create a new buffer (memory buffer) for pixel data.*
- `int l4re_video_goos_delete_buffer (l4re_video_goos_t goos, unsigned idx) L4_NOTHROW`  
*Delete a pixel buffer.*
- `int l4re_video_goos_get_static_buffer (l4re_video_goos_t goos, unsigned idx, l4_cap_idx_t buffer) L4_NOTHROW`  
*Get the data-space capability of the static pixel buffer.*
- `int l4re_video_goos_create_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW`  
*Create a new view (.*
- `int l4re_video_goos_delete_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW`  
*Delete a view.*
- `int l4re_video_goos_get_view (l4re_video_goos_t goos, unsigned idx, l4re_video_view_t *view) L4_NOTHROW`  
*Get a view for the given index.*
- `int l4re_video_view_refresh (l4re_video_view_t *view, int x, int y, int w, int h) L4_NOTHROW`  
*Flush the given rectangle of pixels of the given view.*
- `int l4re_video_view_get_info (l4re_video_view_t *view, l4re_video_view_info_t *info) L4_NOTHROW`  
*Retrieve information about the given view.*
- `int l4re_video_view_set_info (l4re_video_view_t *view, l4re_video_view_info_t *info) L4_NOTHROW`  
*Set properties of the view.*
- `int l4re_video_view_set_viewport (l4re_video_view_t *view, int x, int y, int w, int h, unsigned long bofs) L4_NOTHROW`  
*Set the viewport parameters of a view.*
- `int l4re_video_view_stack (l4re_video_view_t *view, l4re_video_view_t *pivot, int behind) L4_NOTHROW`  
*Change the stacking order in the stack of visible views.*

### 13.9.15.1 Detailed Description

### 13.9.15.2 Typedef Documentation

#### 13.9.15.2.1 l4re\_video\_view\_t

```
typedef struct l4re_video_view_t l4re_video_view_t
```

C representation of a goos view.

A view is a visible rectangle that provides a view to the contents of a buffer (frame buffer) memory object and is placed on a real screen.

### 13.9.15.3 Enumeration Type Documentation

#### 13.9.15.3.1 l4re\_video\_goos\_info\_flags\_t

```
enum l4re_video_goos_info_flags_t
```

Flags of information on the goos.

## Enumerator

F_l4re_video_goos_auto_refresh	The graphics display is automatically refreshed.
F_l4re_video_goos_pointer	We have a mouse pointer.
F_l4re_video_goos_dynamic_views	Supports dynamically allocated views.
F_l4re_video_goos_dynamic_buffers	Supports dynamically allocated buffers.

Definition at line 39 of file [goos.h](#).

## 13.9.15.3.2 l4re\_video\_view\_info\_flags\_t

```
enum l4re_video_view_info_flags_t
```

Flags of information on a view.

## Enumerator

F_l4re_video_view_none	everything for this view is static (the VESA-FB case)
F_l4re_video_view_set_buffer	buffer object for this view can be changed
F_l4re_video_view_set_buffer_offset	buffer offset can be set
F_l4re_video_view_set_bytes_per_line	bytes per line can be set
F_l4re_video_view_set_pixel	pixel type can be set
F_l4re_video_view_set_position	position on screen can be set
F_l4re_video_view_dyn_allocated	View is dynamically allocated.
F_l4re_video_view_set_background	Set view as background for session.
F_l4re_video_view_set_flags	Set view property flags.
F_l4re_video_view_above	Flag the view as stay on top.
F_l4re_video_view_flags_mask	Mask containing all possible property flags.

Definition at line 33 of file [view.h](#).

## 13.9.15.4 Function Documentation

## 13.9.15.4.1 l4re\_video\_goos\_create\_buffer()

```
int l4re_video_goos_create_buffer (
    l4re_video_goos_t goos,
    unsigned long size,
    l4_cap_idx_t buffer )
```

Create a new buffer (memory buffer) for pixel data.

## Parameters

<i>goos</i>	the target object for the operation.
<i>size</i>	the size in bytes for the pixel buffer.
<i>buffer</i>	a capability index to receive the data-space capability for the buffer.

**Returns**

$\geq 0$ : The index of the created buffer (used to assign views and for deletion).  $< 0$ : on error

**13.9.15.4.2 l4re\_video\_goos\_create\_view()**

```
int l4re_video_goos_create_view (
    l4re_video_goos_t goos,
    l4re_video_view_t * view )
```

Create a new view (.

**See also**

[l4re\\_video\\_view\\_t](#)

**Parameters**

	<i>goos</i>	the goos session to use.
out	<i>view</i>	structure initialized to the new view.

**13.9.15.4.3 l4re\_video\_goos\_delete\_buffer()**

```
int l4re_video_goos_delete_buffer (
    l4re_video_goos_t goos,
    unsigned idx )
```

Delete a pixel buffer.

**Parameters**

<i>goos</i>	the target goos object.
<i>idx</i>	the buffer index of the buffer to delete (the return value of <a href="#">l4re_video_goos_create_buffer()</a> )

**13.9.15.4.4 l4re\_video\_goos\_delete\_view()**

```
int l4re_video_goos_delete_view (
    l4re_video_goos_t goos,
    l4re_video_view_t * view )
```

Delete a view.

**Parameters**

<i>goos</i>	the goos session to use.
<i>view</i>	the view to delete, the given data-structure is invalid afterwards.

#### 13.9.15.4.5 l4re\_video\_goos\_get\_static\_buffer()

```
int l4re_video_goos_get_static_buffer (
    l4re_video_goos_t goos,
    unsigned idx,
    l4_cap_idx_t buffer )
```

Get the data-space capability of the static pixel buffer.

##### Parameters

<i>goos</i>	The target goos object.
<i>idx</i>	Index of the static buffer.
<i>buffer</i>	A capability index to receive the data-space capability.

This function allows access to static, preexisting pixel buffers. Such static buffers exist for static configurations, such as the VESA framebuffer.

#### 13.9.15.4.6 l4re\_video\_goos\_get\_view()

```
int l4re_video_goos_get_view (
    l4re_video_goos_t goos,
    unsigned idx,
    l4re_video_view_t * view )
```

Get a view for the given index.

##### Parameters

	<i>goos</i>	the target goos session.
	<i>idx</i>	the index of the view to retrieve.
out	<i>view</i>	structure initialized to the view with the given index.

This function allows to access static views as provided by the VESA framebuffer (the monitor). However, it also allows to access dynamic views created with [l4re\\_video\\_goos\\_create\\_view\(\)](#).

#### 13.9.15.4.7 l4re\_video\_goos\_info()

```
int l4re_video_goos_info (
    l4re_video_goos_t goos,
    l4re_video_goos_info_t * ginfo )
```

Get information on a goos.

##### Parameters

	<i>goos</i>	Goos object
out	<i>ginfo</i>	Pointer to goos information structure.

**Returns**

0 for success, <0 on error

- [-L4\\_ENODEV](#)
- IPC errors

**13.9.15.4.8 l4re\_video\_goos\_refresh()**

```
int l4re_video_goos_refresh (
    l4re_video_goos_t goos,
    int x,
    int y,
    int w,
    int h )
```

Flush a rectangle of pixels of the goos screen.

**Parameters**

<i>goos</i>	the target object of the operation.
<i>x</i>	the x-coordinate of the upper left corner of the rectangle
<i>y</i>	the y-coordinate of the upper left corner of the rectangle
<i>w</i>	the width of the rectangle to be flushed
<i>h</i>	the height of the rectangle

**13.9.15.4.9 l4re\_video\_view\_get\_info()**

```
int l4re_video_view_get_info (
    l4re_video_view_t * view,
    l4re_video_view_info_t * info )
```

Retrieve information about the given *view*.

**Parameters**

	<i>view</i>	the target view for the operation.
out	<i>info</i>	a buffer receiving the information about the view.

**13.9.15.4.10 l4re\_video\_view\_refresh()**

```
int l4re_video_view_refresh (
    l4re_video_view_t * view,
    int x,
    int y,
    int w,
    int h )
```

Flush the given rectangle of pixels of the given *view*.

## Parameters

<i>view</i>	the target view of the operation.
<i>x</i>	x-coordinate of the upper left corner
<i>y</i>	y-coordinate of the upper left corner
<i>w</i>	the width of the rectangle
<i>h</i>	the height of the rectangle

**13.9.15.4.11 l4re\_video\_view\_set\_info()**

```
int l4re_video_view_set_info (
    l4re_video_view_t * view,
    l4re_video_view_info_t * info )
```

Set properties of the view.

## Parameters

<i>view</i>	the target view of the operation.
<i>info</i>	the parameters to be set on the view.

Which parameters can be manipulated on a given view can be figured out with [l4re\\_video\\_view\\_get\\_info\(\)](#) and this depends on the concrete instance the view object.

**13.9.15.4.12 l4re\_video\_view\_set\_viewport()**

```
int l4re_video_view_set_viewport (
    l4re_video_view_t * view,
    int x,
    int y,
    int w,
    int h,
    unsigned long bofs )
```

Set the viewport parameters of a view.

## Parameters

<i>view</i>	the target view of the operation.
<i>x</i>	the x-coordinate of the upper left corner on the screen.
<i>y</i>	the y-coordinate of the upper left corner on the screen.
<i>w</i>	the width of the view.
<i>h</i>	the height of the view.
<i>bofs</i>	the offset (in bytes) of the upper left pixel in the memory buffer

This function is a convenience wrapper for [l4re\\_video\\_view\\_set\\_info\(\)](#), just setting the often changed parameters of a dynamic view. With this function a view can be placed on the real screen and at the same time on its backing buffer.

#### 13.9.15.4.13 l4re\_video\_view\_stack()

```
int l4re_video_view_stack (
    l4re_video_view_t * view,
    l4re_video_view_t * pivot,
    int behind )
```

Change the stacking order in the stack of visible views.

##### Parameters

<i>view</i>	the target view for the operation.
<i>pivot</i>	the neighbor view, relative to which <i>view</i> shall be stacked. a NULL value allows top ( <i>behind</i> = 1) and bottom ( <i>behind</i> = 0) placement of the view.
<i>behind</i>	describes the placement of the view relative to the <i>pivot</i> view.

### 13.10.5 Debugging API

Debugging Interface.

Collaboration diagram for Debugging API:

## Data Structures

- class [L4Re::Debug\\_obj](#)  
*Debug interface.*

### 13.10.5.1 Detailed Description

Debugging Interface.

The debugging interface can be provided to retrieve, or log debugging information for an object. Each class may realize the debug interface to provide debugging functionality. For example, the region map objects provide a facility to dump the currently established memory regions.

See also

[L4::Debug\\_obj](#) for more information.

## 13.10.6 Event API

[Event](#) API.

Collaboration diagram for Event API:

## Data Structures

- class [L4Re::Event](#)  
*Event class.*
- struct [L4Re::Default\\_event\\_payload](#)  
*Default event stream payload.*
- class [L4Re::Event\\_buffer\\_t< PAYLOAD >](#)  
*Event buffer class.*

### 13.10.6.1 Detailed Description

[Event](#) API.

On top of a shared [L4Re::Dataspace](#) (and optionally using [L4::Triggerable](#)), the event API implements asynchronous event transmission from an event provider (server) to an event receiver (client). Events are put into an [Event\\_buffer\\_t](#) residing on the shared [L4Re::Dataspace](#).

This interface is usually not used directly. Instead use [L4Re::Util::Event\\_t](#) for clients. An example server portion is implemented in [L4Re::Util::Event\\_svr](#).

This interface is usually used with [L4Re::Default\\_event\\_payload](#) which delivers HID events modeled on the Linux evdev API, and the interface's methods allow further querying of information about the HID event streams.

### 13.10.7 L4Re ELF Auxiliary Information

API for embedding auxiliary information into binary programs.

Collaboration diagram for L4Re ELF Auxiliary Information:

#### Data Structures

- struct [l4re\\_elf\\_aux\\_t](#)

- struct [l4re\\_elf\\_aux\\_vma\\_t](#)  
*Auxiliary vector element for a reserved virtual memory area.*
- struct [l4re\\_elf\\_aux\\_mword\\_t](#)  
*Auxiliary vector element for a single unsigned data word.*

#### Macros

- `#define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".ro.l4re_elf_aux"), aligned(sizeof(l4_umword_t))))`  
*Define an auxiliary vector element.*
- `#define L4RE_ELF_AUX_ELEM_T(type, id, tag, val...) static L4RE_ELF_AUX_ELEM type id = {tag, sizeof(type), val}`  
*Define an auxiliary vector element.*

#### Typedefs

- typedef struct [l4re\\_elf\\_aux\\_t](#) [l4re\\_elf\\_aux\\_t](#)  
*Generic header for each auxiliary vector element.*
- typedef struct [l4re\\_elf\\_aux\\_vma\\_t](#) [l4re\\_elf\\_aux\\_vma\\_t](#)  
*Auxiliary vector element for a reserved virtual memory area.*
- typedef struct [l4re\\_elf\\_aux\\_mword\\_t](#) [l4re\\_elf\\_aux\\_mword\\_t](#)  
*Auxiliary vector element for a single unsigned data word.*

#### Enumerations

- enum {  
[L4RE\\_ELF\\_AUX\\_T\\_NONE](#) = 0 , [L4RE\\_ELF\\_AUX\\_T\\_VMA](#) , [L4RE\\_ELF\\_AUX\\_T\\_STACK\\_SIZE](#) ,  
[L4RE\\_ELF\\_AUX\\_T\\_STACK\\_ADDR](#) ,  
[L4RE\\_ELF\\_AUX\\_T\\_KIP\\_ADDR](#) , [L4RE\\_ELF\\_AUX\\_T\\_EX\\_REGS\\_FLAGS](#) }

### 13.10.7.1 Detailed Description

API for embedding auxiliary information into binary programs.

This API allows information for the binary loader to be embedded into a binary application. This information can be reserved areas in the virtual memory of an application and things such as the stack size to be allocated for the first application thread.

### 13.10.7.2 Macro Definition Documentation

#### 13.10.7.2.1 L4RE\_ELF\_AUX\_ELEM

```
#define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".ro14re_elf_aux"), aligned(sizeof(l4_umword_t))))
```

Define an auxiliary vector element.

This is the generic method for defining auxiliary vector elements. A more convenient way is to use `L4RE_ELF_AUX_ELEM_T`.

Usage:

```
L4RE_ELF_AUX_ELEM l4re_elf_aux_vma_t decl_name =
    { L4RE_ELF_AUX_T_VMA, sizeof(l4re_elf_aux_vma_t), 0x2000, 0x4000 };
```

Definition at line 52 of file [elf\\_aux.h](#).

#### 13.10.7.2.2 L4RE\_ELF\_AUX\_ELEM\_T

```
#define L4RE_ELF_AUX_ELEM_T(
    type,
    id,
    tag,
    val... )    static L4RE_ELF_AUX_ELEM type id = {tag, sizeof(type), val}
```

Define an auxiliary vector element.

#### Parameters

<i>type</i>	is the data type for the element (e.g., <a href="#">l4re_elf_aux_vma_t</a> )
<i>id</i>	is the identifier (variable name) for the declaration (the variable is defined with <code>static</code> storage class)
<i>tag</i>	is the tag value for the element e.g., <a href="#">L4RE_ELF_AUX_T_VMA</a>
<i>val</i>	are the values to be set in the descriptor

Usage:

```
L4RE_ELF_AUX_ELEM_T(l4re_elf_aux_vma_t, decl_name, L4RE_ELF_AUX_T_VMA, 0x2000, 0x4000 );
```

Definition at line 67 of file [elf\\_aux.h](#).

### 13.10.7.3 Enumeration Type Documentation

#### 13.10.7.3.1 anonymous enum

anonymous enum

## Enumerator

L4RE_ELF_AUX_T_NONE	Tag for an invalid element in the auxiliary vector.
L4RE_ELF_AUX_T_VMA	Tag for descriptor for a reserved virtual memory area.
L4RE_ELF_AUX_T_STACK_SIZE	Tag for descriptor that defines the stack size for the first application thread.
L4RE_ELF_AUX_T_STACK_ADDR	Tag for descriptor that defines the stack address for the first application thread.
L4RE_ELF_AUX_T_KIP_ADDR	Tag for descriptor that defines the KIP address for the binaries address space.
L4RE_ELF_AUX_T_EX_REGS_FLAGS	Tag for descriptor to override ex_regs() flags.

Definition at line 70 of file [elf\\_aux.h](#).

### 13.10.8 L4Re Protocol identifiers

Fix [L4Re](#) Protocol Constants.

*Goos server class.*

### 13.10.9.1 Detailed Description

Documentation of the [L4](#) Runtime Environment utility functionality in C++.

### 13.10.9.2 Kumem utilities

Collaboration diagram for Kumem utilities:

#### Functions

- `int L4Re::Util::kumem_alloc (l4_addr_t *mem, unsigned pages_order, L4::Cap< L4::Task > task=L4Re::Env::env() ->task(), L4::Cap< L4Re::Rm > rm=L4Re::Env::env() ->rm()) noexcept`  
*Allocate state area.*

#### 13.10.9.2.1 Detailed Description

#### 13.10.9.2.2 Function Documentation

##### 13.10.9.2.2.1 kumem\_alloc()

```

int L4Re::Util::kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    L4::Cap< L4::Task > task = L4Re::Env::env() ->task(),
    L4::Cap< L4Re::Rm > rm = L4Re::Env::env() ->rm() ) [noexcept]

```

Allocate state area.

#### Parameters

out	<i>mem</i>	Pointer to memory that has been allocated.
	<i>pages_order</i>	Size to allocate, in log2 pages.
	<i>task</i>	Task to use for allocation.
	<i>rm</i>	Region manager to use for allocation.

#### Return values

0	for success
<0	error code on failure

**Note**

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

## 13.10.10 Logging interface

Interface for log output.

Collaboration diagram for Logging interface:

## Data Structures

- class [L4Re::Log](#)  
*Log interface class.*

### 13.10.10.1 Detailed Description

Interface for log output.

The logging interface provides a facility sending log output. One purpose of the interface is to serialize the output and provide the possibility to tag output sent to a specific log object.

### 13.10.11 Name-space API

API for name spaces that store capabilities.

Collaboration diagram for Name-space API:

## Data Structures

- class [L4Re::Namespace](#)  
*Name-space interface.*

### 13.10.11.1 Detailed Description

API for name spaces that store capabilities.

This is a basic abstraction for managing a mapping from human-readable names to capabilities. In particular, a name can also be mapped to a capability that refers to another name space object. By this means name spaces can be constructed hierarchically.

Name spaces play a central role in [L4Re](#), because the implementation of the name space objects determines the policy which capabilities (which objects) are accessible to a client of a name space.

### 13.10.12 Parent API

[Parent](#) interface.

Collaboration diagram for Parent API:

#### Data Structures

- class [L4Re::Parent](#)  
*[Parent](#) interface.*

#### 13.10.12.1 Detailed Description

[Parent](#) interface.

The parent interface provides means for an [L4](#) task to signal changes in its execution state. The main purpose is to signal program termination to the program that started it, so that its resources can be reclaimed. In a typical [L4Re](#) system, this program will be Moe or Ned.

See also

[L4Re::Parent](#) for information about the concrete interface.

### 13.10.13 Region map API

Virtual address-space management.

Collaboration diagram for Region map API:

## Data Structures

- class [L4Re::Rm](#)  
*Region map.*

### 13.10.13.1 Detailed Description

Virtual address-space management.

A region map object implements two protocols. The first protocol is the kernel page-fault protocol, to resolve page faults for threads running in an [L4](#) task. The second protocol is the region map protocol itself, which allows managing the virtual memory address space of an [L4](#) task.

There are two basic concepts provided by the region map abstraction:

- **Areas** are reserved ranges in the virtual memory address space.
- **Regions** are ranges that are backed by (part of) a dataspace, i.e. accessing them results in access to the physical memory the dataspace manages.

Note that regions may live outside of areas and that an area does not necessarily contain any region.

Areas can be reserved for special use or for attaching a dataspace at a later time. When attaching a dataspace, the user can instruct the region map to search for an appropriate range to attach to. Regions are skipped in this search since they already have dataspace attached to them, and, depending on [L4Re::Rm::F::In\\_area](#), areas are skipped because they are reserved. Amongst others, areas can be used to attach several dataspace inside a certain range of addresses without interference from other threads.

When a region map receives a page fault IPC, the region map will check if the faulting virtual address lies in a region. If yes, it will answer the page fault IPC with a mapping from the backing dataspace. If not, an error is returned.

Depending on the system type, an attached dataspace might or might not be mapped eagerly. MMU-based systems resort to lazy mapping while systems without MMU do eager mappings by default. The [L4Re::Rm::F::Eager\\_map](#) and [L4Re::Rm::F::No\\_eager\\_map](#) flags can be used to force the respective behaviour, independent of the underlying system. In case both flags are given, the [L4Re::Rm::F::No\\_eager\\_map](#) flag wins.

*A [Gpio\\_module](#) groups multiple GPIO pins together.*
- class [L4vbus::Pci\\_host\\_bridge](#)  
*A Pci host bridge.*
- class [L4vbus::Pci\\_dev](#)  
*A PCI device.*

### 13.10.14.1 Detailed Description

C++ interface of the Vbus API.

The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu ([Interrupt controller](#)) for interrupt handling.

The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

Refer to [L4 Vbus functions](#) for the C API.

## 13.11 L4SHM-based ring buffer implementation

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.

Collaboration diagram for L4SHM-based ring buffer implementation:

### Modules

- [Internal](#)
- [Receiver](#)
- [Sender](#)

### 13.11.1 Detailed Description

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.

It requires an already allocated L4SHM area to be attached to sender and receiver. It will allocate an SHM chunk within this area and provides functions to produce data and consume data in FIFO order from the ring buffer.

The sender side of the buffer needs to be initialized *before* the receiver side, because allocation of the SHM chunk and the necessary signals is done on the sender side and the receiver initialization tries to attach to these objects.

### 13.11.2 Internal

Collaboration diagram for Internal:

## Data Structures

- struct [l4shmc\\_ringbuf\\_head\\_t](#)  
*Head field of a ring buffer.*
- struct [l4shmc\\_ringbuf\\_t](#)

*Basic server loop for handling client requests.*

## Enumerations

- enum `L4::lpc_svr::Reply_mode` { `L4::lpc_svr::Reply_compound` , `L4::lpc_svr::Reply_separate` }  
*Reply mode for server loop.*

### 13.12.1 Detailed Description

Server-Side framework for implementing object-oriented servers.

## 13.12.2 Enumeration Type Documentation

### 13.12.2.1 Reply\_mode

```
enum L4::Ipc_svr::Reply_mode
```

Reply mode for server loop.

The reply mode specifies if the server loop shall do a compound reply and wait operation ([Reply\\_compound](#)), which is the most performant method. Note, `setup_wait()` is called before the reply. The other way is to call reply and wait separately and call `setup_wait` in between.

The actual mode is determined by the return value of the `before_reply()` hook in the `LOOP_HOOKS` of [L4::Server](#).

Enumerator

<code>Reply_compound</code>	<a href="#">Server</a> shall use a compound reply and wait (fast).
<code>Reply_separate</code>	<a href="#">Server</a> shall call reply and wait separately.

Definition at line 50 of file [ipc\\_server\\_loop](#).

## 13.13 Shared Memory Library

*Get memory overhead per area that is not available for chunks.*
- long [l4shmc\\_chunk\\_overhead](#) (void)  
*Get memory overhead required in addition to the chunk capacity for adding one chunk.*

### 13.13.1 Detailed Description

L4SHM provides a shared memory infrastructure that establishes a shared memory area between multiple parties and uses a fast notification mechanism.

A shared memory area consists of chunks and signals. A chunk is a defined chunk of memory within the memory area with a maximum size. A chunk is filled (written) by a producer and read by a consumer. When a producer has finished writing to the chunk it signals a data ready notification to the consumer.

A consumer attaches to a chunk and waits for the producer to fill the chunk. After reading out the chunk it marks the chunk free again.

A shared memory area can have multiple chunks.

The interface is divided in three roles.

- The master role, responsible for setting up a shared memory area.
- A producer, generating data into a chunk
- A consumer, receiving data.

A signal can be connected with a chunk or can be used independently (e.g. for multiple chunks).

## 13.13.2 Function Documentation

### 13.13.2.1 l4shmc\_area\_overhead()

```
long l4shmc_area_overhead (
    void )
```

Get memory overhead per area that is not available for chunks.

#### Returns

Size of the overhead in bytes.

### 13.13.2.2 l4shmc\_area\_size()

```
long l4shmc_area_size (
    l4shmc_area_t const * shmarea )
```

Get size of shared memory area.

#### Parameters

<i>shmarea</i>	Shared memory area.
----------------	---------------------

#### Return values

$>0$	Size of the shared memory area.
$<0$	Error.

### 13.13.2.3 l4shmc\_area\_size\_free()

```
long l4shmc_area_size_free (
    l4shmc_area_t const * shmarea )
```

Get free size of shared memory area.

To get the max size to pass to `l4shmc_add_chunk`, subtract [l4shmc\\_chunk\\_overhead\(\)](#).

#### Parameters

<i>shmarea</i>	Shared memory area.
----------------	---------------------

#### Returns

Size of the shared memory area.

### 13.13.2.4 l4shmc\_attach()

```
long l4shmc_attach (
    char const * shmc_name,
    l4shmc_area_t * shmarea )
```

Attach to a shared memory area.

#### Parameters

	<i>shmc_name</i>	Name of the shared memory area.
out	<i>shmarea</i>	Pointer to shared memory area descriptor to be filled with information for the shared memory area.

On success, the data in 'shmarea' contains a client number which can be used to mutual agree about client initialization:

- [l4shmc\\_get\\_client\\_nr\(\)](#) returns the client number stored in 'shmarea'. The first attached client will get 0 and this number is increased for each attached client.
- [l4shmc\\_mark\\_client\\_initialized\(\)](#) tells other clients that this client has finished its initialization.
- [l4shmc\\_get\\_initialized\\_clients\(\)](#) returns the bitmap of initialized clients attached to this shared memory.

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

### 13.13.2.5 l4shmc\_chunk\_overhead()

```
long l4shmc_chunk_overhead (
    void )
```

Get memory overhead required in addition to the chunk capacity for adding one chunk.

#### Returns

Size of the overhead in bytes.

### 13.13.2.6 l4shmc\_connect\_chunk\_signal()

```
long l4shmc_connect_chunk_signal (
    l4shmc_chunk_t * chunk,
    l4shmc_signal_t * signal )
```

Connect a signal with a chunk.

## Parameters

<i>chunk</i>	Chunk to attach the signal to.
<i>signal</i>	Signal to attach.

## Return values

0	Success.
<0	Error.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.2.7 l4shmc\_create()**

```
long l4shmc_create (
    char const * shmc_name )
```

Create a shared memory area.

## Parameters

<i>shmc_name</i>	Name of the shared memory area.
------------------	---------------------------------

## Return values

0	Success.
-L4_ENOMEM	The requested size is too big.
-L4_ENOENT	No valid capability with the name of the shared memory area found.
<0	Errors from l4re_rm_attach or l4re_ns_register_obj_srv.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.2.8 l4shmc\_get\_client\_nr()**

```
long l4shmc_get_client_nr (
    l4shmc_area_t const * shmarea )
```

Determine the client number of the shared memory region.

## Parameters

<i>shmarea</i>	The shared memory area.
----------------	-------------------------

**Returns**

client number.

**13.13.2.9 l4shmc\_get\_initialized\_clients()**

```
long l4shmc_get_initialized_clients (
    l4shmc_area_t * shmarea,
    l4_umword_t * bitmask )
```

Fetch the `_clients_init_done` bitmask of the shared memory area.

**Parameters**

	<i>shmarea</i>	The shared memory area.
out	<i>bitmask</i>	The bitmask describing which clients are initialized.

**Return values**

0	Success.
<0	Error.

**See also**

[l4shmc\\_mark\\_client\\_initialized\(\)](#), [l4shmc\\_get\\_client\\_nr\(\)](#)

**Examples**

[examples/libs/shmc/prodcons.c](#).

**13.13.2.10 l4shmc\_mark\_client\_initialized()**

```
long l4shmc_mark_client_initialized (
    l4shmc_area_t * shmarea )
```

Mark this shared memory client as 'initialized'.

The corresponding bit is set in the `_clients_init_done` bitmask. The bitmask can be fetched with [l4shmc\\_get\\_initialized\\_clients\(\)](#).

**Parameters**

<i>shmarea</i>	The shared memory area.
----------------	-------------------------

**Return values**

0	Success.
<0	Error.

## Examples

[examples/libs/shmc/prodcons.c](#).

### 13.13.3 Chunks

*Get capacity of a chunk.*
- l4shmc\_signal\_t \* [l4shmc\\_chunk\\_signal](#) (l4shmc\_chunk\_t const \*chunk)  
*Get the registered signal of a chunk.*

#### 13.13.3.1 Detailed Description

#### 13.13.3.2 Function Documentation

##### 13.13.3.2.1 l4shmc\_add\_chunk()

```

long l4shmc_add_chunk (
    l4shmc_area_t * shmarea,
    char const * chunk_name,
    l4\_umword\_t chunk_capacity,
    l4shmc_chunk_t * chunk )
  
```

Add a chunk in the shared memory area.

## Parameters

	<i>shmarea</i>	The shared memory area to put the chunk in.
	<i>chunk_name</i>	Name of the chunk.
	<i>chunk_capacity</i>	Capacity for payload of the chunk in bytes.
out	<i>chunk</i>	Chunk structure to fill in.

## Return values

0	Success.
<0	Error.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.3.2.2 l4shmc\_chunk\_capacity()**

```
long l4shmc_chunk_capacity (  
    l4shmc_chunk_t const * chunk ) [inline]
```

Get capacity of a chunk.

## Parameters

<i>chunk</i>	Chunk.
--------------	--------

## Returns

Capacity of the chunk in bytes.

**13.13.3.2.3 l4shmc\_chunk\_ptr()**

```
void * l4shmc_chunk_ptr (  
    l4shmc_chunk_t const * chunk ) [inline]
```

Get data pointer to chunk.

## Parameters

<i>chunk</i>	Chunk.
--------------	--------

## Returns

Chunk pointer.

## Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.3.2.4 l4shmc\_chunk\_signal()

```
l4shmc_signal_t * l4shmc_chunk_signal (
    l4shmc_chunk_t const * chunk ) [inline]
```

Get the registered signal of a chunk.

##### Parameters

<i>chunk</i>	Chunk.
--------------	--------

##### Return values

0	No signal has been registered with this chunk.
<i>!=0</i>	Pointer to signal otherwise.

#### 13.13.3.2.5 l4shmc\_get\_chunk()

```
long l4shmc_get_chunk (
    l4shmc_area_t * shmbarea,
    char const * chunk_name,
    l4shmc_chunk_t * chunk ) [inline]
```

Get chunk out of shared memory area.

##### Parameters

	<i>shmbarea</i>	Shared memory area.
	<i>chunk_name</i>	Name of the chunk.
out	<i>chunk</i>	Chunk data structure to fill.

##### Return values

0	Success.
<0	Error.

##### Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.3.2.6 l4shmc\_get\_chunk\_to()

```
long l4shmc_get_chunk_to (
    l4shmc_area_t * shmbarea,
    char const * chunk_name,
    l4_umword_t timeout_ms,
    l4shmc_chunk_t * chunk )
```

Get chunk out of shared memory area, with timeout.

## Parameters

	<i>shmbarea</i>	Shared memory area.
	<i>chunk_name</i>	Name of the chunk.
	<i>timeout_ms</i>	Timeout in milliseconds to wait for the chunk to appear in the shared memory area.
out	<i>chunk</i>	Chunk data structure to fill.

## Return values

0	Success.
<0	Error.

## 13.13.3.2.7 l4shmc\_iterate\_chunk()

```
long l4shmc_iterate_chunk (
    l4shmc_area_t const * shmbarea,
    char const ** chunk_name,
    long offs )
```

Iterate over names of all existing chunks.

## Parameters

<i>shmbarea</i>	Shared memory area.
<i>chunk_name</i>	Where the name of the current chunk will be stored
<i>offs</i>	0 to start iteration, return value of previous call to <a href="#">l4shmc_iterate_chunk()</a> to get next chunk

## Return values

0	No more chunks available.
<0	Error.
>0	Iterator value for the next call.

## 13.13.3.3 Consumer

Collaboration diagram for Consumer:

## Functions

- long [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_reading](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark chunk busy reading.*
- long [l4shmc\\_enable\\_chunk](#) (l4shmc\_chunk\_t \*chunk)  
*Enable a signal connected with a chunk.*
- long [l4shmc\\_wait\\_chunk](#) (l4shmc\_chunk\_t \*chunk)  
*Wait on a specific chunk.*
- long [l4shmc\\_wait\\_chunk\\_to](#) (l4shmc\_chunk\_t \*chunk, [l4\\_timeout\\_t](#) timeout)  
*Check whether a specific chunk has an event pending, with timeout.*
- long [l4shmc\\_wait\\_chunk\\_try](#) (l4shmc\_chunk\_t \*chunk)  
*Check whether a specific chunk has an event pending.*
- long [l4shmc\\_chunk\\_consumed](#) (l4shmc\_chunk\_t \*chunk)  
*Mark a chunk as free.*
- long [l4shmc\\_is\\_chunk\\_ready](#) (l4shmc\_chunk\_t const \*chunk)  
*Check whether data is available.*
- long [l4shmc\\_chunk\\_size](#) (l4shmc\_chunk\_t const \*chunk)  
*Get current size of a chunk.*

### 13.13.3.3.1 Detailed Description

### 13.13.3.3.2 Function Documentation

#### 13.13.3.3.2.1 l4shmc\_chunk\_consumed()

```
long l4shmc_chunk_consumed (
    l4shmc_chunk_t * chunk ) [inline]
```

Mark a chunk as free.

#### Parameters

<i>chunk</i>	Chunk to mark as free.
--------------	------------------------

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.3.3.2.2 l4shmc\_chunk\_size()

```
long l4shmc_chunk_size (
    l4shmc_chunk_t const * chunk ) [inline]
```

Get current size of a chunk.

## Parameters

<i>chunk</i>	Chunk.
--------------	--------

## Returns

Current size of the chunk in bytes.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.3.3.2.3 l4shmc\_chunk\_try\_to\_take\_for\_reading()**

```
long l4shmc_chunk_try_to_take_for_reading (  
    l4shmc_chunk_t * chunk ) [inline]
```

Try to mark chunk busy reading.

## Parameters

<i>chunk</i>	chunk to mark busy reading.
--------------	-----------------------------

## Return values

0	Chunk could be taken and can be read.
<0	Chunk could not be taken, try again.

**13.13.3.3.2.4 l4shmc\_enable\_chunk()**

```
long l4shmc_enable_chunk (  
    l4shmc_chunk_t * chunk )
```

Enable a signal connected with a chunk.

## Parameters

<i>chunk</i>	Chunk to enable.
--------------	------------------

## Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.

**13.13.3.3.2.5 l4shmc\_is\_chunk\_ready()**

```
long l4shmc_is_chunk_ready (
    l4shmc_chunk_t const * chunk ) [inline]
```

Check whether data is available.

**Parameters**

<i>chunk</i>	Chunk to check.
--------------	-----------------

**Return values**

<i>!=0</i>	Data is available.
<i>0</i>	No data available.

**13.13.3.3.2.6 l4shmc\_wait\_chunk()**

```
long l4shmc_wait_chunk (
    l4shmc_chunk_t * chunk ) [inline]
```

Wait on a specific chunk.

**Parameters**

<i>chunk</i>	Chunk to wait for.
--------------	--------------------

**Return values**

<i>0</i>	Success.
<i>&lt;0</i>	Error.

**Examples**

[examples/libs/shmc/prodcons.c](#).

**13.13.3.3.2.7 l4shmc\_wait\_chunk\_to()**

```
long l4shmc_wait_chunk_to (
    l4shmc_chunk_t * chunk,
    l4_timeout_t timeout )
```

Check whether a specific chunk has an event pending, with timeout.

**Parameters**

<i>chunk</i>	Chunk to check.
<i>timeout</i>	Timeout.

## Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

**13.13.3.3.2.8 l4shmc\_wait\_chunk\_try()**

```
long l4shmc_wait_chunk_try (
    l4shmc_chunk_t * chunk ) [inline]
```

Check whether a specific chunk has an event pending.

## Parameters

<i>chunk</i>	Chunk to check.
--------------	-----------------

## Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

**13.13.3.4 Producer**

Collaboration diagram for Producer:

**Functions**

- long [l4shmc\\_chunk\\_try\\_to\\_take](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark chunk busy.*
- long [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_writing](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark chunk busy writing.*
- long [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_overwriting](#) (l4shmc\_chunk\_t \*chunk)

*Try to mark the chunk busy writing after it was ready for reading.*

- long `l4shmc_chunk_ready` (`l4shmc_chunk_t *chunk`, `l4_umword_t size`)

*Mark chunk as filled (ready).*

- long `l4shmc_chunk_ready_sig` (`l4shmc_chunk_t *chunk`, `l4_umword_t size`)

*Mark chunk as filled (ready) and signal consumer.*

- long `l4shmc_is_chunk_clear` (`l4shmc_chunk_t const *chunk`)

*Check whether chunk is free.*

#### 13.13.3.4.1 Detailed Description

#### 13.13.3.4.2 Function Documentation

##### 13.13.3.4.2.1 `l4shmc_chunk_ready()`

```
long l4shmc_chunk_ready (
    l4shmc_chunk_t * chunk,
    l4_umword_t size ) [inline]
```

Mark chunk as filled (ready).

##### Parameters

<i>chunk</i>	chunk.
<i>size</i>	Size of data in the chunk, in bytes.

##### Return values

<i>0</i>	Success.
<i>&lt;0</i>	Error.

##### 13.13.3.4.2.2 `l4shmc_chunk_ready_sig()`

```
long l4shmc_chunk_ready_sig (
    l4shmc_chunk_t * chunk,
    l4_umword_t size ) [inline]
```

Mark chunk as filled (ready) and signal consumer.

##### Parameters

<i>chunk</i>	chunk.
<i>size</i>	Size of data in the chunk, in bytes.

##### Return values

<i>0</i>	Success.
<i>&lt;0</i>	Error.

### Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.3.4.2.3 l4shmc\_chunk\_try\_to\_take()

```
long l4shmc_chunk_try_to_take (
    l4shmc_chunk_t * chunk ) [inline]
```

Try to mark chunk busy.

### Parameters

<i>chunk</i>	chunk to mark.
--------------	----------------

### Return values

0	Chunk could be taken.
<0	Chunk could not be taken, try again.

### Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.3.4.2.4 l4shmc\_chunk\_try\_to\_take\_for\_overwriting()

```
long l4shmc_chunk_try_to_take_for_overwriting (
    l4shmc_chunk_t * chunk ) [inline]
```

Try to mark the chunk busy writing after it was ready for reading.

### Parameters

<i>chunk</i>	chunk to mark busy writing.
--------------	-----------------------------

This function is used by the producer to overwrite a message if the consumer did not read the message within an expected time. This function can only be used if the consumer uses [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_reading\(\)](#) before reading the chunk.

### Return values

0	Chunk could be taken and can be written.
<0	Chunk could not be taken, try again.

#### 13.13.3.4.2.5 l4shmc\_chunk\_try\_to\_take\_for\_writing()

```
long l4shmc_chunk_try_to_take_for_writing (
```

```
l4shmc_chunk_t * chunk ) [inline]
```

Try to mark chunk busy writing.

This function is actually an alias for [l4shmc\\_chunk\\_try\\_to\\_take\(\)](#).

#### Parameters

<i>chunk</i>	chunk to mark busy writing.
--------------	-----------------------------

#### Return values

0	Chunk could be taken and can be written.
<0	Chunk could not be taken, try again.

#### 13.13.3.4.2.6 l4shmc\_is\_chunk\_clear()

```
long l4shmc_is_chunk_clear (
    l4shmc_chunk_t const * chunk ) [inline]
```

Check whether chunk is free.

#### Parameters

<i>chunk</i>	Chunk to check.
--------------	-----------------

#### Return values

!=0	Chunk is clear.
0	Chunk is not clear.

### 13.13.4 Signals

Collaboration diagram for Signals:

#### Modules

- [Consumer](#)
- [Producer](#)

## Functions

- long [l4shmc\\_add\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, l4shmc\_signal\_t \*signal)  
*Add a signal for the shared memory area.*
- long [l4shmc\\_attach\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, [l4\\_cap\\_idx\\_t](#) thread, l4shmc\_signal\_t \*signal)  
*Attach to signal.*
- long [l4shmc\\_get\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, l4shmc\_signal\_t \*signal)  
*Get signal object from the shared memory area.*
- [l4\\_cap\\_idx\\_t l4shmc\\_signal\\_cap](#) (l4shmc\_signal\_t const \*signal)  
*Get the signal capability of a signal.*
- long [l4shmc\\_check\\_magic](#) (l4shmc\_chunk\_t const \*chunk)  
*Check magic value of a chunk.*

### 13.13.4.1 Detailed Description

### 13.13.4.2 Function Documentation

#### 13.13.4.2.1 l4shmc\_add\_signal()

```
long l4shmc_add_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
    l4shmc_signal_t * signal )
```

Add a signal for the shared memory area.

#### Parameters

	<i>shmarea</i>	The shared memory area.
	<i>signal_name</i>	Name of the signal.
out	<i>signal</i>	Signal structure to fill in.

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

#### 13.13.4.2.2 l4shmc\_attach\_signal()

```
long l4shmc_attach_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
```

```
l4_cap_idx_t thread,  
l4shmc_signal_t * signal )
```

Attach to signal.

## Parameters

	<i>shmarea</i>	Shared memory area.
	<i>signal_name</i>	Name of the signal.
	<i>thread</i>	Thread capability index to attach the signal to.
out	<i>signal</i>	Signal data structure to fill.

## Return values

0	Success.
<0	Error.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.4.2.3 l4shmc\_check\_magic()**

```
long l4shmc_check_magic (
    l4shmc_chunk_t const * chunk ) [inline]
```

Check magic value of a chunk.

## Parameters

<i>chunk</i>	Chunk.
--------------	--------

## Return values

0	Magic value is not valid.
>0	Chunk is OK, the magic value is valid.

**13.13.4.2.4 l4shmc\_get\_signal()**

```
long l4shmc_get_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
    l4shmc_signal_t * signal )
```

Get signal object from the shared memory area.

## Parameters

	<i>shmarea</i>	Shared memory area.
	<i>signal_name</i>	Name of the signal.
out	<i>signal</i>	Signal data structure to fill.

## Return values

0	Success.
<0	Error.

**13.13.4.2.5 l4shmc\_signal\_cap()**

```
l4_cap_idx_t l4shmc_signal_cap (
    l4shmc_signal_t const * signal ) [inline]
```

Get the signal capability of a signal.

## Parameters

<i>signal</i>	Signal.
---------------	---------

## Returns

Capability of the signal object.

**13.13.4.3 Consumer**

Collaboration diagram for Consumer:

**Functions**

- long [l4shmc\\_enable\\_signal](#) (l4shmc\_signal\_t \*signal)  
*Enable a signal.*
- long [l4shmc\\_wait\\_any](#) (l4shmc\_signal\_t \*\*retsignal)  
*Wait on any signal.*
- long [l4shmc\\_wait\\_any\\_try](#) (l4shmc\_signal\_t \*\*retsignal)  
*Check whether any waited signal has an event pending.*
- long [l4shmc\\_wait\\_any\\_to](#) (l4\_timeout\_t timeout, l4shmc\_signal\_t \*\*retsignal)  
*Wait for any signal with timeout.*
- long [l4shmc\\_wait\\_signal](#) (l4shmc\_signal\_t \*signal)  
*Wait on a specific signal.*
- long [l4shmc\\_wait\\_signal\\_to](#) (l4shmc\_signal\_t \*signal, l4\_timeout\_t timeout)  
*Wait on a specific signal, with timeout.*
- long [l4shmc\\_wait\\_signal\\_try](#) (l4shmc\_signal\_t \*signal)  
*Check whether a specific signal has an event pending.*

#### 13.13.4.3.1 Detailed Description

#### 13.13.4.3.2 Function Documentation

##### 13.13.4.3.2.1 l4shmc\_enable\_signal()

```
long l4shmc_enable_signal (
    l4shmc_signal_t * signal )
```

Enable a signal.

##### Parameters

<i>signal</i>	Signal to enable.
---------------	-------------------

##### Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.

##### 13.13.4.3.2.2 l4shmc\_wait\_any()

```
long l4shmc_wait_any (
    l4shmc_signal_t ** retsignal ) [inline]
```

Wait on any signal.

##### Parameters

out	<i>retsignal</i>	Signal received.
-----	------------------	------------------

##### Return values

0	Success.
<0	Error.

##### 13.13.4.3.2.3 l4shmc\_wait\_any\_to()

```
long l4shmc_wait_any_to (
    l4_timeout_t timeout,
    l4shmc_signal_t ** retsignal )
```

Wait for any signal with timeout.

**Parameters**

	<i>timeout</i>	Timeout.
out	<i>retsignal</i>	Signal that has the event pending if any.

**Return values**

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

**13.13.4.3.2.4 l4shmc\_wait\_any\_try()**

```
long l4shmc_wait_any_try (
    l4shmc_signal_t ** retsignal ) [inline]
```

Check whether any waited signal has an event pending.

**Parameters**

out	<i>retsignal</i>	Signal that has the event pending if any.
-----	------------------	---

**Return values**

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

**13.13.4.3.2.5 l4shmc\_wait\_signal()**

```
long l4shmc_wait_signal (
    l4shmc_signal_t * signal ) [inline]
```

Wait on a specific signal.

**Parameters**

<i>signal</i>	Signal to wait for.
---------------	---------------------

**Return values**

0	Success.
<0	Error.

## Examples

[examples/libs/shmc/prodcons.c](#).

**13.13.4.3.2.6 l4shmc\_wait\_signal\_to()**

```
long l4shmc_wait_signal_to (
    l4shmc_signal_t * signal,
    l4_timeout_t timeout )
```

Wait on a specific signal, with timeout.

## Parameters

<i>signal</i>	Signal to wait for.
<i>timeout</i>	Timeout.

## Return values

0	Success.
<0	Error.

**13.13.4.3.2.7 l4shmc\_wait\_signal\_try()**

```
long l4shmc_wait_signal_try (
    l4shmc_signal_t * signal ) [inline]
```

Check whether a specific signal has an event pending.

## Parameters

<i>signal</i>	Signal to check.
---------------	------------------

## Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

#### 13.13.4.4 Producer

*Get user readable error messages for the return codes.*

### 13.14.1 Detailed Description

Sigma0 API bindings.

Convenience bindings for the Sigma0 protocol.

## 13.14.2 Enumeration Type Documentation

### 13.14.2.1 l4sigma0\_return\_flags\_t

```
enum l4sigma0_return_flags_t
```

Return flags of libsigma0 functions.

Enumerator

L4SIGMA0_OK	Ok.
L4SIGMA0_NOTALIGNED	Phys, virt or size not aligned.
L4SIGMA0_IPCERROR	IPC error.
L4SIGMA0_NOFPAGE	No fpage received.
L4SIGMA0_SMALLERFPAGE	Superpage requested but smaller flexpage received.

Definition at line 78 of file [sigma0.h](#).

## 13.14.3 Function Documentation

### 13.14.3.1 l4sigma0\_debug\_dump()

```
void l4sigma0_debug_dump (
    l4_cap_idx_t sigma0 )
```

Request sigma0 to dump internal debug information.

Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
---------------	--

The debug information, such as internal memory maps, as well as statistics about the internal allocators is dumped to the kernel debugger.

### 13.14.3.2 l4sigma0\_map\_anypage()

```
int l4sigma0_map_anypage (
    l4_cap_idx_t sigma0,
    l4_addr_t map_area,
    unsigned log2_map_size,
    l4_addr_t * base,
    unsigned sz )
```

Request an arbitrary free page of RAM.

Parameters

	<i>sigma0</i>	Capability selector for the sigma0 gate.
--	---------------	--

## Parameters

	<i>map_area</i>	The base address of the local virtual memory area where the page should be mapped.
	<i>log2_map_size</i>	The size of the requested page log 2 (the size in bytes is $2^{\text{log2\_map\_size}}$ ). This must be at least the minimal page size. By specifying larger sizes the largest possible hardware page size will be used.
out	<i>base</i>	Physical address of the page received (i.e. the send base of the received mapping if any).
	<i>sz</i>	Size to map by the server in $2^{\text{sz}}$ bytes.

## Return values

0	Success.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function requests arbitrary free memory from sigma0. It should be used whenever spare memory is needed, instead of requesting specific physical memory with [l4sigma0\\_map\\_mem\(\)](#).

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

## 13.14.3.3 l4sigma0\_map\_errstr()

```
char const * l4sigma0_map_errstr (
    int err ) [inline]
```

Get user readable error messages for the return codes.

## Parameters

<i>err</i>	The error code reported by the <i>map</i> functions.
------------	--

## Returns

A string containing the error message.

Definition at line 210 of file [sigma0.h](#).

## 13.14.3.4 l4sigma0\_map\_iomem()

```
int l4sigma0_map_iomem (
    l4_cap_idx_t sigma0,
    l4_addr_t phys,
    l4_addr_t virt,
    l4_addr_t size,
    int cached )
```

Request IO memory from sigma0.

## Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>phys</i>	The physical address to be requested (page aligned).
<i>virt</i>	The virtual address where the memory should be mapped to (page aligned).
<i>size</i>	The size of the IO memory area to be mapped (multiple of page size)
<i>cached</i>	Requests cacheable IO memory if 1 and uncached if 0.

## Return values

0	Success.
-L4SIGMA0_NOTALIGNED	<i>phys</i> , <i>virt</i> , or <i>size</i> are not aligned.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function is similar to [l4sigma0\\_map\\_mem\(\)](#), the difference is that it requests IO memory. IO memory is everything that is not known to be normal RAM. Also ACPI tables or the BIOS memory is treated as IO memory.

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

## 13.14.3.5 l4sigma0\_map\_kip()

```
l4_kernel_info_t * l4sigma0_map_kip (
    l4_cap_idx_t sigma0,
    void * addr,
    unsigned log2_size )
```

Map the kernel info page from sigma0 to addr.

## Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>addr</i>	Start of the receive window to receive KIP in.
<i>log2_size</i>	Size of the receive window to receive KIP in.

## Returns

Address KIP was mapped to, 0 indicates an error.

## 13.14.3.6 l4sigma0\_map\_mem()

```
int l4sigma0_map_mem (
    l4_cap_idx_t sigma0,
    l4_addr_t phys,
    l4_addr_t virt,
    l4_addr_t size )
```

Request a memory mapping from sigma0.

## Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>phys</i>	The physical address of the requested page (must be at least aligned to the minimum page size).
<i>virt</i>	The virtual address where the paged should be mapped in the local address space (must be at least aligned to the minimum page size).
<i>size</i>	The size of the requested page, this must be a multiple of the minimum page size.

## Return values

<i>0</i>	Success.
<i>-L4SIGMA0_NOTALIGNED</i>	<i>phys</i> , <i>virt</i> , or <i>size</i> are not aligned.
<i>-L4SIGMA0_IPCERROR</i>	IPC error.
<i>-L4SIGMA0_NOFPAGE</i>	No fpage received.

This function only maps normal RAM. To map other memory, use [l4sigma0\\_map\\_iomem\(\)](#). See also there for the distinction between both memory types.

This is the direct method to request memory from sigma0. There is also the indirect method where sigma0 will answer page faults with a mapping that is one-to-one between the faulting virtual page and the backing physical page. See [L4::Pager::page\\_fault\(\)](#). For an overview of the memory hierarchy, see [Memory management - Data Spaces and the Region Map](#).

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

*New operator that does not throw exceptions.*
- `void operator delete (void *, cxx::Nothrow const &) noexcept`  
*Delete operator complementing the new operator not throwing exceptions.*

### 13.15.1 Detailed Description

### 13.15.2 Function Documentation

#### 13.15.2.1 clamp()

```
template<typename T1 >
T1 cxx::clamp (
    T1 v,
    T1 lo,
    T1 hi ) [inline]
```

Limit *v* to the range given by *lo* and *hi*.

##### Parameters

<i>v</i>	The value to clamp.
<i>lo</i>	The lower boundary to clamp <i>v</i> to.
<i>hi</i>	The upper boundary to clamp <i>v</i> to.

Definition at line 120 of file [minmax](#).

#### 13.15.2.2 max() [1/2]

```
template<typename A , typename ... ARGS>
constexpr A const & cxx::max (
    A const & a1,
    A const & a2,
    ARGS const &... a ) [constexpr]
```

Get the maximum of *a1* and *a2* up to *aN*.

##### Parameters

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔</i> <i>a</i>	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.

Definition at line 89 of file [minmax](#).

#### 13.15.2.3 max() [2/2]

```
template<typename A , typename ... ARGS>
constexpr A const & cxx::max (
    cxx::identity_t< A > const & a1,
    cxx::identity_t< A > const & a2,
    ARGS const &... a ) [constexpr]
```

Get the maximum of *a1* and *a2* up to *aN*.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔</i> <i>a</i>	Arbitrary number of additional parameters.

Matches with explicit template type A.

Definition at line 104 of file [minmax](#).

**13.15.2.4 min() [1/2]**

```
template<typename A , typename ... ARGS>
constexpr A const & cxx::min (
    A const & a1,
    A const & a2,
    ARGS const &... a ) [constexpr]
```

Get the minimum of a1 and a2 upt to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔</i> <i>a</i>	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.

Definition at line 47 of file [minmax](#).

**13.15.2.5 min() [2/2]**

```
template<typename A , typename ... ARGS>
constexpr A const & cxx::min (
    cxx::identity_t< A > const & a1,
    cxx::identity_t< A > const & a2,
    ARGS const &... a ) [constexpr]
```

Get the minimum of a1 and a2 upt to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔</i> <i>a</i>	Arbitrary number of additional parameters.

Matches with explicit template type A.

Definition at line 64 of file [minmax](#).

### 13.15.2.6 operator new()

```
void * operator new (  
    size_t ,  
    void * mem,  
    cxx::Nothrow const & ) [inline], [noexcept]
```

Simple placement new operator.

#### Parameters

<i>mem</i>	the address of the memory block to place the new object.
------------	--

#### Returns

the address given by *mem*.

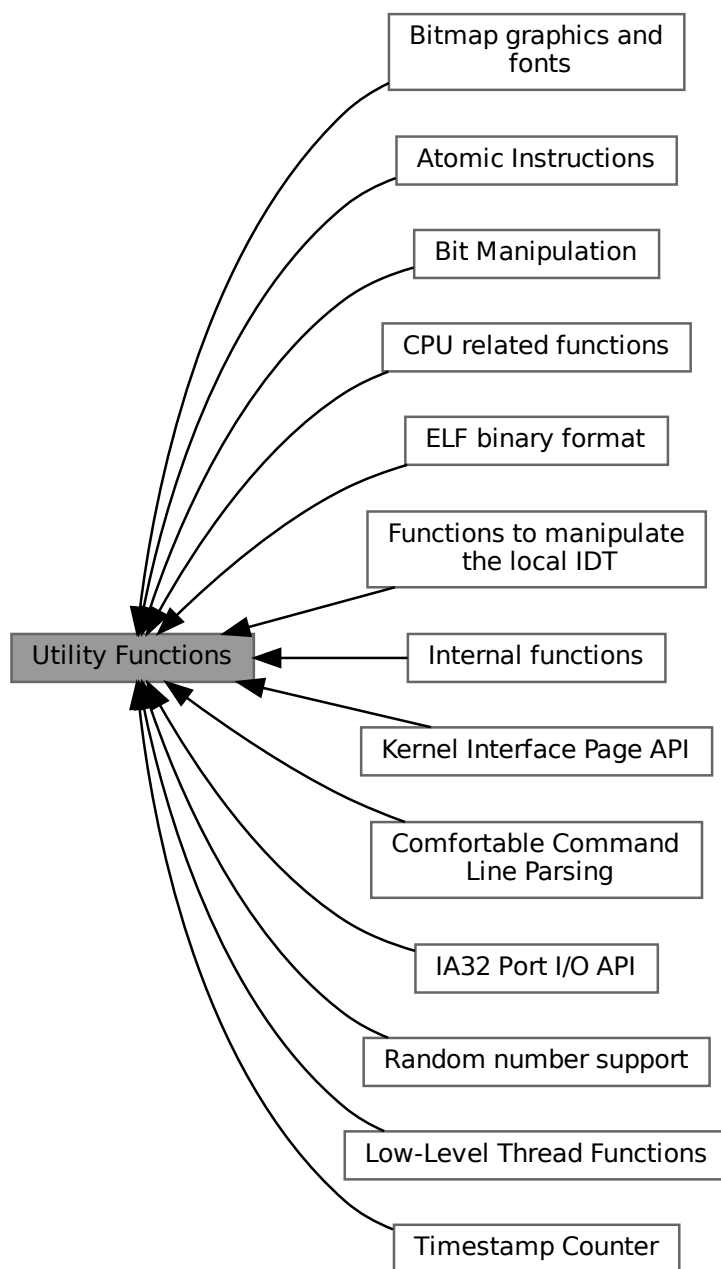

Definition at line 39 of file [std\\_alloc](#).

## 13.16 Utility Functions

Utilities, generic file.

*Touch data areas to force mapping (read-write)*

### 13.16.1 Detailed Description

Utilities, generic file.

### 13.16.2 Function Documentation

#### 13.16.2.1 [l4\\_sleep\(\)](#)

```
void l4_sleep (
    l4\_uint32\_t ms )
```

Suspend thread for a period of *ms* milliseconds.

## Parameters

<i>ms</i>	Time in milliseconds
-----------	----------------------

## Examples

[examples/libs/libirq/async\\_isr.c](#), [examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), and [examples/sys/start-with-exc/m](#)

Referenced by [L4Re::Namespace::query\(\)](#).

Here is the caller graph for this function:

## 13.16.2.2 I4\_touch\_ro()

```
void l4_touch_ro (
    const void * addr,
    unsigned size ) [inline]
```

Touch data area to force mapping (read-only)

## Parameters

<i>addr</i>	Start of memory area to touch.
<i>size</i>	Size of area to touch.

## Examples

[examples/sys/singlestep/main.c](#).

Definition at line 94 of file [util.h](#).

References [L4\\_PAGESIZE](#), and [I4\\_trunc\\_page\(\)](#).

Here is the call graph for this function:

### 13.16.2.3 l4\_touch\_rw()

```
void l4_touch_rw (
    const void * addr,
    unsigned size ) [inline]
```

Touch data areas to force mapping (read-write)

#### Parameters

<i>addr</i>	Start of memory area to touch.
<i>size</i>	Size of area to touch.

#### Examples

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 107 of file [util.h](#).

References [L4\\_PAGESIZE](#), and [l4\\_trunc\\_page\(\)](#).

Here is the call graph for this function:

### 13.16.2.4 l4\_usleep()

```
void l4_usleep (
    l4_uint64_t us )
```

Suspend thread for a period of *us* microseconds.

#### Parameters

<i>us</i>	Time in microseconds
-----------	----------------------

#### Note

The timer resolution of [L4](#) kernels is usually 1ms.

## 13.16.2.5 l4util\_micros2l4to()

```
l4_timeout_s l4util_micros2l4to (
    l4_uint64_t us )
```

Calculate l4 timeouts.

## Parameters

<i>us</i>	time in microseconds. Special cases: <ul style="list-style-type: none"> <li>• 0 -&gt; timeout 0</li> <li>• ~0U -&gt; timeout NEVER</li> </ul>
-----------	---

## Returns

the corresponding l4\_timeout value

**Deprecated** Use l4\_timeout\_from\_us().

## 13.16.2.6 l4util\_splitlog2\_hdl()

```
long l4util_splitlog2_hdl (
    l4_addr_t start,
    l4_addr_t end,
    long(*) (l4_addr_t s, l4_addr_t e, int log2size) handler ) [inline]
```

Split a range into log2 base and size aligned chunks.

## Parameters

<i>start</i>	Start of range
<i>end</i>	End of range (inclusive) (e.g. 2-4 is len 3)
<i>handler</i>	Handler function that is called with start and end (both inclusive) of the chunk. On success, the handler must return 0, if it returns !=0 the function will immediately return with the return code of the handler.

## Returns

0 on success, != 0 otherwise

Definition at line 53 of file [splitlog2.h](#).

References [L4\\_EINVAL](#), and [l4util\\_splitlog2\\_size\(\)](#).

Here is the call graph for this function:

### 13.16.2.7 l4util\_splitlog2\_size()

```
l4_addr_t l4util_splitlog2_size (  
    l4_addr_t start,  
    l4_addr_t end ) [inline]
```

Return log2 base and size aligned length of a range.

#### Parameters

<i>start</i>	Start of range
<i>end</i>	End of range (inclusive) (e.g. 2-4 is len 3)

#### Returns

length of elements in log2size (length is  $1 \ll \log2size$ )

Definition at line 72 of file [splitlog2.h](#).

Referenced by [l4util\\_splitlog2\\_hdl\(\)](#).

Here is the caller graph for this function:

### 13.16.3 Atomic Instructions

Collaboration diagram for Atomic Instructions:

**13.16.3.1 Detailed Description****13.16.3.2 Function Documentation****13.16.3.2.1 l4util\_add16()**

```
void l4util_add16 (
    volatile l4\_uint16\_t * dest,
    l4\_uint16\_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 474 of file [atomic.h](#).

### 13.16.3.2.2 l4util\_add16\_res()

```
l4_uint16_t l4util_add16_res (
    volatile l4_uint16_t * dest,
    l4_uint16_t val ) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

#### Returns

res

Definition at line 526 of file [atomic.h](#).

### 13.16.3.2.3 l4util\_add32()

```
void l4util_add32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 478 of file [atomic.h](#).

### 13.16.3.2.4 l4util\_add32\_res()

```
l4_uint32_t l4util_add32_res (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

#### Returns

res

Definition at line 530 of file [atomic.h](#).

#### 13.16.3.2.5 l4util\_add8()

```
void l4util_add8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 470 of file [atomic.h](#).

#### 13.16.3.2.6 l4util\_add8\_res()

```
l4_uint8_t l4util_add8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 522 of file [atomic.h](#).

#### 13.16.3.2.7 l4util\_and16()

```
void l4util_and16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val ) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 502 of file [atomic.h](#).

#### 13.16.3.2.8 l4util\_and16\_res()

```
l4_uint16_t l4util_and16_res (
    volatile l4_uint16_t * dest,
    l4_uint16_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

## Returns

res

Definition at line 550 of file [atomic.h](#).

**13.16.3.2.9 l4util\_and32()**

```
void l4util_and32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 506 of file [atomic.h](#).

**13.16.3.2.10 l4util\_and32\_res()**

```
l4_uint32_t l4util_and32_res (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

## Returns

res

Definition at line 554 of file [atomic.h](#).

**13.16.3.2.11 l4util\_and8()**

```
void l4util_and8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 498 of file [atomic.h](#).

**13.16.3.2.12 l4util\_and8\_res()**

```
l4_uint8_t l4util_and8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

## Returns

res

Definition at line 546 of file [atomic.h](#).

**13.16.3.2.13 l4util\_atomic\_add()**

```
void l4util_atomic_add (
    volatile long * dest,
    long val ) [inline]
```

Atomic add.

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add

Definition at line 482 of file [atomic.h](#).

**13.16.3.2.14 l4util\_atomic\_inc()**

```
void l4util_atomic_inc (
    volatile long * dest ) [inline]
```

Atomic increment.

## Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 425 of file [atomic.h](#).

**13.16.3.2.15 l4util\_cmpxchg()**

```
int l4util_cmpxchg (  
    volatile l4_umword_t * dest,  
    l4_umword_t cmp_val,  
    l4_umword_t new_val ) [inline]
```

Atomic compare and exchange (machine wide fields)

## Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

## Returns

0 if comparison failed, 1 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 381 of file [atomic.h](#).

Referenced by [l4util\\_btr\(\)](#), [l4util\\_bts\(\)](#), [l4util\\_clear\\_bit\(\)](#), and [l4util\\_set\\_bit\(\)](#).

Here is the caller graph for this function:

### 13.16.3.2.16 l4util\_cmpxchg16()

```
int l4util_cmpxchg16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t cmp_val,
    l4_uint16_t new_val ) [inline]
```

Atomic compare and exchange (16 bit version)

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 365 of file [atomic.h](#).

### 13.16.3.2.17 l4util\_cmpxchg32()

```
int l4util_cmpxchg32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t cmp_val,
    l4_uint32_t new_val ) [inline]
```

Atomic compare and exchange (32 bit version)

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 357 of file [atomic.h](#).

### 13.16.3.2.18 l4util\_cmpxchg8()

```
int l4util_cmpxchg8 (
    volatile l4_uint8_t * dest,
```

```
14_uint8_t cmp_val,  
14_uint8_t new_val ) [inline]
```

Atomic compare and exchange (8 bit version)

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 373 of file [atomic.h](#).

#### 13.16.3.2.19 l4util\_dec16()

```
void l4util_dec16 (  
    volatile 14_uint16_t * dest ) [inline]
```

#### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 433 of file [atomic.h](#).

#### 13.16.3.2.20 l4util\_dec16\_res()

```
14_uint16_t l4util_dec16_res (  
    volatile 14_uint16_t * dest ) [inline]
```

#### Parameters

<i>dest</i>	destination operand
-------------	---------------------

#### Returns

res

Definition at line 458 of file [atomic.h](#).

#### 13.16.3.2.21 l4util\_dec32()

```
void l4util_dec32 (  
    volatile 14_uint32_t * dest ) [inline]
```

## Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 437 of file [atomic.h](#).

**13.16.3.2.22 l4util\_dec32\_res()**

```
l4_uint32_t l4util_dec32_res (
    volatile l4_uint32_t * dest ) [inline]
```

## Parameters

<i>dest</i>	destination operand
-------------	---------------------

## Returns

res

Definition at line 462 of file [atomic.h](#).

**13.16.3.2.23 l4util\_dec8()**

```
void l4util_dec8 (
    volatile l4_uint8_t * dest ) [inline]
```

## Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 429 of file [atomic.h](#).

**13.16.3.2.24 l4util\_dec8\_res()**

```
l4_uint8_t l4util_dec8_res (
    volatile l4_uint8_t * dest ) [inline]
```

## Parameters

<i>dest</i>	destination operand
-------------	---------------------

## Returns

res

Definition at line 454 of file [atomic.h](#).

**13.16.3.2.25 l4util\_inc16()**

```
void l4util_inc16 (
    volatile l4_uint16_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 417 of file [atomic.h](#).

**13.16.3.2.26 l4util\_inc16\_res()**

```
l4_uint16_t l4util_inc16_res (
    volatile l4_uint16_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

**Returns**

res

Definition at line 446 of file [atomic.h](#).

**13.16.3.2.27 l4util\_inc32()**

```
void l4util_inc32 (
    volatile l4_uint32_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 421 of file [atomic.h](#).

**13.16.3.2.28 l4util\_inc32\_res()**

```
l4_uint32_t l4util_inc32_res (
    volatile l4_uint32_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

**Returns**

res

Definition at line 450 of file [atomic.h](#).**13.16.3.2.29 l4util\_inc8()**

```
void l4util_inc8 (
    volatile l4_uint8_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 413 of file [atomic.h](#).**13.16.3.2.30 l4util\_inc8\_res()**

```
l4_uint8_t l4util_inc8_res (
    volatile l4_uint8_t * dest ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

**Returns**

res

Definition at line 442 of file [atomic.h](#).**13.16.3.2.31 l4util\_or16()**

```
void l4util_or16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 514 of file [atomic.h](#).**13.16.3.2.32 l4util\_or16\_res()**

```
l4_uint16_t l4util_or16_res (
```

```
volatile l4_uint16_t * dest,  
l4_uint16_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 562 of file [atomic.h](#).

**13.16.3.2.33 l4util\_or32()**

```
void l4util_or32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 518 of file [atomic.h](#).

**13.16.3.2.34 l4util\_or32\_res()**

```
l4_uint32_t l4util_or32_res (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 566 of file [atomic.h](#).

**13.16.3.2.35 l4util\_or8()**

```
void l4util_or8 (  
    volatile l4_uint8_t * dest,  
    l4_uint8_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 510 of file [atomic.h](#).

**13.16.3.2.36 l4util\_or8\_res()**

```
l4_uint8_t l4util_or8_res (  
    volatile l4_uint8_t * dest,  
    l4_uint8_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

## Returns

res

Definition at line 558 of file [atomic.h](#).

**13.16.3.2.37 l4util\_sub16()**

```
void l4util_sub16 (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 490 of file [atomic.h](#).

**13.16.3.2.38 l4util\_sub16\_res()**

```
l4_uint16_t l4util_sub16_res (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t val ) [inline]
```

## Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 538 of file [atomic.h](#).

**13.16.3.2.39 l4util\_sub32()**

```
void l4util_sub32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 494 of file [atomic.h](#).

**13.16.3.2.40 l4util\_sub32\_res()**

```
l4_uint32_t l4util_sub32_res (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 542 of file [atomic.h](#).

**13.16.3.2.41 l4util\_sub8()**

```
void l4util_sub8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 486 of file [atomic.h](#).

#### 13.16.3.2.42 l4util\_sub8\_res()

```
l4_uint8_t l4util_sub8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 534 of file [atomic.h](#).

#### 13.16.3.2.43 l4util\_xchg()

```
l4_umword_t l4util_xchg (
    volatile l4_umword_t * dest,
    l4_umword_t val ) [inline]
```

Atomic exchange (machine wide fields)

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	new value for dest

##### Returns

old value at destination

Definition at line 407 of file [atomic.h](#).

#### 13.16.3.2.44 l4util\_xchg16()

```
l4_uint16_t l4util_xchg16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val ) [inline]
```

Atomic exchange (16 bit version)

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	new value for dest

**Returns**

old value at destination

Definition at line 395 of file [atomic.h](#).

**13.16.3.2.45 l4util\_xchg32()**

```
l4_uint32_t l4util_xchg32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t val ) [inline]
```

Atomic exchange (32 bit version)

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	new value for dest

**Returns**

old value at destination

Definition at line 389 of file [atomic.h](#).

**13.16.3.2.46 l4util\_xchg8()**

```
l4_uint8_t l4util_xchg8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val ) [inline]
```

Atomic exchange (8 bit version)

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	new value for dest

**Returns**

old value at destination

Definition at line 401 of file [atomic.h](#).

### 13.16.4.1 Detailed Description

### 13.16.4.2 Function Documentation

#### 13.16.4.2.1 l4util\_bsf()

```
int l4util_bsf (  
    l4_umword_t word ) [inline]
```

Bit scan forward.

##### Parameters

<i>word</i>	value (machine size)
-------------	----------------------

##### Returns

index of least significant bit set in word, -1 if no bit is set (word == 0)

"bit scan forward", find least significant bit set in word.

Definition at line 318 of file [bitops.h](#).

#### 13.16.4.2.2 l4util\_bsr()

```
int l4util_bsr (  
    l4_umword_t word ) [inline]
```

Bit scan reverse.

##### Parameters

<i>word</i>	value (machine size)
-------------	----------------------

##### Returns

index of most significant set bit in word, -1 if no bit is set (word == 0)

"bit scan reverse", find most significant set bit in word (-> LOG2(word))

Definition at line 301 of file [bitops.h](#).

#### 13.16.4.2.3 l4util\_btc()

```
int l4util_btc (  
    int b,  
    volatile l4_umword_t * dest ) [inline]
```

Bit test and complement.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

**Returns**

Old value of bit *b*.

Complement bit *b* and return old value.

Definition at line 396 of file [bitops.h](#).

**13.16.4.2.4 l4util\_btr()**

```
int l4util_btr (
    int b,
    volatile l4_umword_t * dest ) [inline]
```

Bit test and reset.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

**Returns**

Old value of bit *b*.

Reset bit *b* and return old value.

Definition at line 280 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

#### 13.16.4.2.5 l4util\_bts()

```
int l4util_bts (
    int b,
    volatile l4_umword_t * dest ) [inline]
```

Bit test and set.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

**Returns**

Old value of bit *b*.

Set the *b* bit of *dest* to 1 and return the old value.

Definition at line 258 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

**13.16.4.2.6 l4util\_clear\_bit()**

```
void l4util_clear_bit (  
    int b,  
    volatile l4_umword_t * dest ) [inline]
```

Clear bit in memory.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 228 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

#### 13.16.4.2.7 l4util\_complement\_bit()

```
void l4util_complement_bit (
    int b,
    volatile l4_umword_t * dest ) [inline]
```

Complement bit in memory.

##### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 361 of file [bitops.h](#).

#### 13.16.4.2.8 l4util\_find\_first\_set\_bit()

```
int l4util_find_first_set_bit (
    const void * dest,
    l4_size_t size ) [inline]
```

Find the first set bit in a memory region.

##### Parameters

<i>dest</i>	bit string
<i>size</i>	size of string in bits (must be a multiple of L4_MWORD_BITS!)

##### Returns

number of the first set bit, >= size if no bit is set

Definition at line 402 of file [bitops.h](#).

#### 13.16.4.2.9 l4util\_find\_first\_zero\_bit()

```
int l4util_find_first_zero_bit (
    const void * dest,
    l4_size_t size ) [inline]
```

Find the first zero bit in a memory region.

#### Parameters

<i>dest</i>	bit string
<i>size</i>	size of string in bits (must be a multiple of L4_MWORD_BITS!)

#### Returns

number of the first zero bit,  $\geq$  size if no bit is set

Definition at line 335 of file [bitops.h](#).

#### 13.16.4.2.10 l4util\_next\_power2()

```
int l4util_next_power2 (
    unsigned long val ) [inline]
```

Find the next power of 2 for a given number.

#### Parameters

<i>val</i>	initial value
------------	---------------

#### Returns

next-highest power of 2

Definition at line 375 of file [bitops.h](#).

#### 13.16.4.2.11 l4util\_set\_bit()

```
void l4util_set_bit (
    int b,
    volatile l4_umword_t * dest ) [inline]
```

Set bit in memory.

#### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 209 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

#### 13.16.4.2.12 l4util\_test\_bit()

```

int l4util_test_bit (
    int b,
    const volatile l4_umword_t * dest ) [inline]
  
```

Test bit (return value of bit)

##### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

##### Returns

Value of bit *b*.

Definition at line 246 of file [bitops.h](#).

### 13.16.5 Bitmap graphics and fonts

This library provides some functions for bitmap handling in frame buffers.

Collaboration diagram for Bitmap graphics and fonts:

## Modules

- [Functions for rendering bitmap data in frame buffers](#)
- [Functions for rendering bitmap fonts to frame buffers](#)

### 13.16.5.1 Detailed Description

This library provides some functions for bitmap handling in frame buffers.

Includes simple functions like filling or copying an area of the frame buffer going up to rendering text into the frame buffer using bitmap fonts.

### 13.16.5.2 Functions for rendering bitmap data in frame buffers

Collaboration diagram for Functions for rendering bitmap data in frame buffers:

### 13.16.5.3 Functions for rendering bitmap fonts to frame buffers

Collaboration diagram for Functions for rendering bitmap fonts to frame buffers:

### 13.16.6 CPU related functions

Collaboration diagram for CPU related functions:

## Functions

- int [l4util\\_cpu\\_has\\_cpuid](#) (void)  
*Check whether the CPU supports the "cpuid" instruction.*
- unsigned int [l4util\\_cpu\\_capabilities](#) (void)  
*Returns the CPU capabilities if the "cpuid" instruction is available.*
- unsigned int [l4util\\_cpu\\_capabilities\\_nocheck](#) (void)  
*Returns the CPU capabilities.*
- void **[l4util\\_cpu\\_cpuid](#)** (unsigned long mode, unsigned long \*eax, unsigned long \*ebx, unsigned long \*ecx, unsigned long \*edx)  
*Generic CPUID access function.*

### 13.16.6.1 Detailed Description

### 13.16.6.2 Function Documentation

#### 13.16.6.2.1 [l4util\\_cpu\\_capabilities](#)()

```
unsigned int l4util_cpu_capabilities (
    void ) [inline]
```

Returns the CPU capabilities if the "cpuid" instruction is available.

#### Returns

CPU capabilities if the "cpuid" instruction is available, 0 if the "cpuid" instruction is not supported.

Definition at line 97 of file [cpu.h](#).

References [l4util\\_cpu\\_capabilities\\_nocheck\(\)](#), and [l4util\\_cpu\\_has\\_cpuid\(\)](#).

Here is the call graph for this function:

### 13.16.6.2.2 l4util\_cpu\_capabilities\_nocheck()

```
unsigned int l4util_cpu_capabilities_nocheck (  
    void ) [inline]
```

Returns the CPU capabilities.

#### Returns

CPU capabilities.

Definition at line 86 of file [cpu.h](#).

References [l4util\\_cpu\\_cpuid\(\)](#).

Referenced by [l4util\\_cpu\\_capabilities\(\)](#).

Here is the call graph for this function:

**13.16.7 Comfortable Command Line Parsing**

Collaboration diagram for Comfortable Command Line Parsing:

**Typedefs**

- typedef void(\* [parse\\_cmd\\_fn\\_t](#)) (int)  
*Function type for PARSE\_CMD\_FN.*
- typedef void(\* [parse\\_cmd\\_fn\\_arg\\_t](#)) (int, const char \*, int)  
*Function type for PARSE\_CMD\_FN\_ARG.*

**Enumerations**

- enum [parse\\_cmd\\_type](#)  
*Types for parsing.*

**Functions**

- int [parse\\_cmdline](#) (int \*argc, const char \*\*\*argv, int arg0,...)  
*Parse the command-line for specified arguments and store the values into variables.*

### 13.16.7.1 Detailed Description

### 13.16.7.2 Function Documentation

#### 13.16.7.2.1 `parse_cmdline()`

```
int parse_cmdline (
    int * argc,
    const char *** argv,
    int arg0,
    ... )
```

Parse the command-line for specified arguments and store the values into variables.

This Functions gets the command-line, and a list of command-descriptors. Then, the command-line is parsed according to the given descriptors, storing strings, switches and numeric arguments at given addresses, and possibly calling specified functions. A default help descriptor is added. Its purpose is to present a short command overview in the case the given command-line does not fit to the descriptors.

Each command-descriptor has the following form:

*short option char, long option name, comment, type, val, addr.*

The *short option char* specifies the short form of the described option. The short form will be recognized after a single dash, or in a group of short options preceeded by a single dash. Specify ' ' if no short form should be used.

The *long option name* specifies the long form of the described option. The long form will be recognized after two dashes. Specify 0 if no long form should be used for this option.

The *comment* is a string that will be used when presenting the short command-line help.

The *type* specifies, if the option should be recognized as

- a number (PARSE\_CMD\_INT),
- a switch (PARSE\_CMD\_SWITCH),
- a string (PARSE\_CMD\_STRING),
- a function call (PARSE\_CMD\_FN, PARSE\_CMD\_FN\_ARG),
- an increment/decrement operator (PARSE\_CMD\_INC, PARSE\_CMD\_DEC).

If *type* is PARSE\_CMD\_INT, the option requires a second argument on the command-line after the option. This argument is parsed as a number. It can be preceeded by 0x to present a hex-value or by 0 to present an octal form. *addr* is interpreted as an int-pointer. The scanned argument from the command-line is stored in this pointer.

If *type* is PARSE\_CMD\_SWITCH, *addr* must be a pointer to int, and the value from *val* is stored at this pointer.

With PARSE\_CMD\_STRING, an additional argument is expected at the cmdline. *addr* must be a pointer to const char\*, and a pointer to the argument on the command line is stored at this pointer. The value in *val* is a default value, which is stored at *addr* if the corresponding option is not given on the command line.

With PARSE\_CMD\_FN\_ARG, *addr* is interpreted as a function pointer of type `parse_cmd_fn_t`. It will be called with *val* as argument if the corresponding option is found.

If *type* is PARSE\_CMD\_FN\_ARG, *addr* is as a function pointer of type `parse_cmd_fn_arg_t`, and handled similar to PARSE\_CMD\_FN. An additional argument is expected at the command line, however. It is given to the called function as 2nd argument, and parsed as an integer as with PARSE\_CMD\_INT as a third argument.

If *type* is PARSE\_CMD\_INC or PARSE\_CMD\_DEC, *addr* is interpreted as an int-pointer. The value of *val* is stored to this pointer first. For every occurrence of the option in the command line, the integer referenced by *addr* is incremented or decremented, respectively.

The list of command-descriptors is terminated by specifying a binary 0 for the short option char.

Note: The short option char 'h' and the long option name "help" must not be specified. They are used for the default help descriptor and produce a short command-options help when specified on the command-line.

**Parameters**

<i>argc</i>	pointer to number of command line parameters as passed to main
<i>argv</i>	pointer to array of command line parameters as passed to main
<i>arg0</i>	format list describing the command line options to parse for

**Returns**

0 if the command-line was successfully parsed, otherwise:

- -1 if the given descriptors are somehow wrong.
- -2 if not enough memory was available to hold temporary structs.
- -3 if the given command-line args did not meet the specified set.
- -4 if the help-option was given.

Upon return, *argc* and *argv* point to a list of arguments that were not scanned as arguments. See `getoptlong` for details on scanning.

### 13.16.8.1 Detailed Description

Functions and types related to ELF binaries.

### 13.16.8.2 Macro Definition Documentation

#### 13.16.8.2.1 ELF32\_R\_TYPE

```
#define ELF32_R_TYPE(  
    i ) ((unsigned char)(i))
```

See also

[Elf\\_R\\_386s](#).

Definition at line [668](#) of file [elf.h](#).

#### 13.16.8.2.2 ELF32\_ST\_BIND

```
#define ELF32_ST_BIND(  
    i ) ((i)>>4)
```

See also

[Elf\\_STBs](#).

Definition at line [898](#) of file [elf.h](#).

#### 13.16.8.2.3 ELF32\_ST\_TYPE

```
#define ELF32_ST_TYPE(  
    i ) ((i)&0xf)
```

See also

[Elf\\_STTs](#).

Definition at line [901](#) of file [elf.h](#).

#### 13.16.8.2.4 ELF64\_R\_TYPE

```
#define ELF64_R_TYPE(  
    i ) ((i) & 0xffffffffL)
```

See also

[Elf\\_R\\_386s](#).

Definition at line [676](#) of file [elf.h](#).

#### 13.16.8.2.5 ELF64\_ST\_BIND

```
#define ELF64_ST_BIND(  
    i ) ((i) >> 4)
```

See also

[Elf\\_STBs](#)

Definition at line [907](#) of file [elf.h](#).

#### 13.16.8.2.6 ELF64\_ST\_TYPE

```
#define ELF64_ST_TYPE(  
    i ) ((i) & 0xf)
```

See also

[Elf\\_STTs](#)

Definition at line [910](#) of file [elf.h](#).

### 13.16.8.3 Enumeration Type Documentation

#### 13.16.8.3.1 anonymous enum

anonymous enum

Enumerator

EI_NIDENT	Number of characters.
-----------	-----------------------

Definition at line [121](#) of file [elf.h](#).

**13.16.8.3.2 Elf\_ARM\_SBs**

enum [Elf\\_ARM\\_SBs](#)

ARM-specific program header flags.

Enumerator

PF_ARM_SB	Segment contains the location addressed by the static base.
-----------	---

Definition at line [775](#) of file [elf.h](#).

**13.16.8.3.3 Elf\_ATs**

enum [Elf\\_ATs](#)

Legal values for [Elf32\\_Auxv.atype](#) / [Elf64\\_Auxv.atype](#).

Enumerator

AT_NULL	End of vector.
AT_IGNORE	Entry should be ignored.
AT_EXECD	File descriptor of program.
AT_PHDR	Program headers for program.
AT_PHEM	Size of program header entry.
AT_PHNUM	Number of program headers.
AT_PAGESZ	System page size.
AT_BASE	Base address of interpreter.
AT_FLAGS	Flags.
AT_ENTRY	Entry point of program.
AT_NOTELF	Program is not ELF.
AT_UID	Real UID.
AT_EUID	Effective UID.
AT_GID	Real GID.
AT_EGID	Effective GID.
AT_L4_AUX	<a href="#">L4Re</a> AUX section.
AT_L4_ENV	<a href="#">L4Re</a> ENV section.

Definition at line [944](#) of file [elf.h](#).

**13.16.8.3.4 Elf\_CLASSs**

enum [Elf\\_CLASSs](#)

File class or capacity.

**Enumerator**

ELFCLASSNONE	Invalid class.
ELFCLASS32	32-bit object
ELFCLASS64	64-bit object
ELFCLASSNUM	Mask for 32-bit or 64-bit class.

Definition at line 302 of file [elf.h](#).

**13.16.8.3.5 Elf\_DATAs**

enum [Elf\\_DATAs](#)

Data encoding.

**Enumerator**

ELFDATANONE	invalid data encoding
ELFDATA2LSB	0x01020304 => [ 0x04 0x03 0x02 0x01 ]
ELFDATA2MSB	0x01020304 => [ 0x01 0x02 0x03 0x04 ]
ELFDATANUM	Mask for valid data encoding.

Definition at line 311 of file [elf.h](#).

**13.16.8.3.6 Elf\_DF\_1s**

enum [Elf\\_DF\\_1s](#)

State flags selectable in the Elf32\_Dyn.d\_un.d\_val / Elf64\_Dyn.d\_un.d\_val element of the DT\_FLAGS\_1 entry in the dynamic section.

**Enumerator**

DF_1_NOW	Set RTLD_NOW for this object.
DF_1_GLOBAL	Set RTLD_GLOBAL for this object.
DF_1_GROUP	Set RTLD_GROUP for this object.
DF_1_NODELETE	Set RTLD_NODELETE for this object.
DF_1_LOADFLTR	Trigger filtee loading at runtime.
DF_1_INITFIRST	Set RTLD_INITFIRST for this object.
DF_1_NOOPEN	Set RTLD_NOOPEN for this object.
DF_1_ORIGIN	\$ORIGIN must be handled.
DF_1_DIRECT	Direct binding enabled.
DF_1_INTERPOSE	Object is used to interpose.

## Enumerator

DF_1_NODEFLIB	Ignore default lib search path.
DF_1_NODUMP	Object can't be dldump'ed.
DF_1_CONFALT	Configuration alternative created.
DF_1_ENDFILTEE	Filtee terminates filters search.
DF_1_DISPRELDNE	Disp reloc applied at build time.
DF_1_DISPRELPND	Disp reloc applied at run-time.

Definition at line 599 of file [elf.h](#).

**13.16.8.3.7 Elf\_DF\_P1s**

enum [Elf\\_DF\\_P1s](#)

Flags in the DT\_POSFLAG\_1 entry effecting only the next DT\_\* entry.

## Enumerator

DF_P1_LAZYLOAD	Lazyload following object.
DF_P1_GROUPPERM	Symbols from next object are not generally available.

Definition at line 628 of file [elf.h](#).

**13.16.8.3.8 Elf\_DFs**

enum [Elf\\_DFs](#)

Values of Elf32\_Dyn.d\_un.d\_val, Elf64\_Dyn.d\_un.d\_val in the DT\_FLAGS entry.

## Enumerator

DF_ORIGIN	Object may use DF_ORIGIN.
DF_SYMBOLIC	Symbol resolutions starts here.
DF_TEXTREL	Object contains text relocations.
DF_BIND_NOW	No lazy binding for this object.
DF_STATIC_TLS	Module uses the static TLS model.

Definition at line 586 of file [elf.h](#).

**13.16.8.3.9 Elf\_DTs**

enum [Elf\\_DTs](#)

Dynamic Array Tags.

See also

[Elf32\\_Dyn.d\\_tag](#), [Elf64\\_Dyn.d\\_tag](#).

#### Enumerator

DT_NULL	end of _DYNAMIC array
DT_NEEDED	name of a needed library
DT_PLTRELSZ	total size of relocation entry
DT_PLTGOT	address assoc with prog link table
DT_HASH	address of symbol hash table
DT_STRTAB	address of string table
DT_SYMTAB	address of symbol table
DT_RELA	address of relocation table
DT_RELASZ	total size of relocation table
DT_RELAENT	size of DT_RELA relocation entry
DT_STRSZ	size of the string table
DT_SYMENT	size of a symbol table entry
DT_INIT	address of initialization function
DT_FINI	address of termination function
DT_SONAME	name of the shared object
DT_RPATH	search library path
DT_SYMBOLIC	alter symbol resolution algorithm
DT_REL	address of relocation table
DT_RELSZ	total size of DT_REL relocation table
DT_RELENT	size of the DT_REL relocation entry
DT_PTRREL	type of relocation entry
DT_DEBUG	for debugging purposes
DT_TEXTREL	at least on entry changes r/o section
DT_JMPREL	address of relocation entries
DT_BIND_NOW	Process relocations of object.
DT_INIT_ARRAY	Array with addresses of init fct.
DT_FINI_ARRAY	Array with addresses of fini fct.
DT_INIT_ARRAYSZ	Size in bytes of DT_INIT_ARRAY.
DT_FINI_ARRAYSZ	Size in bytes of DT_FINI_ARRAY.
DT_RUNPATH	Library search path.
DT_FLAGS	Flags for the object being loaded.
DT_ENCODING	Start of encoded range.
DT_PREINIT_ARRAY	Array with addresses of preinit fct.
DT_PREINIT_ARRAYSZ	size in bytes of DT_PREINIT_ARRAY
DT_NUM	Number used.
DT_LOOS	Start of OS-specific.
DT_HIOS	End of OS-specific.
DT_LOPROC	processor-specific
DT_HIPROC	processor-specific

Definition at line 540 of file [elf.h](#).

**13.16.8.3.10 Elf\_EF\_ARM\_s**

enum [Elf\\_EF\\_ARM\\_s](#)

ARM specific declarations.

Processor specific flags for the ELF header e\_flags field.

**Enumerator**

EF_ARM_ALIGN8	8-bit structure alignment is in use
---------------	-------------------------------------

Definition at line [735](#) of file [elf.h](#).

**13.16.8.3.11 Elf\_EIs**

enum [Elf\\_EIs](#)

Identification Indices.

**See also**

[Elf32\\_Ehdr.e\\_ident](#), [Elf64\\_Ehdr.e\\_ident](#)

**Enumerator**

EI_MAG0	file id 0
EI_MAG1	file id 1
EI_MAG2	file id 2
EI_MAG3	file id 3
EI_CLASS	file class
EI_DATA	data encoding
EI_VERSION	file version
EI_OSABI	Operating system / ABI identification.
EI_ABIVERSION	ABI version.
EI_PAD	start of padding bytes

Definition at line [278](#) of file [elf.h](#).

**13.16.8.3.12 Elf\_EMs**

enum [Elf\\_EMs](#)

Required architecture.

**See also**

[Elf32\\_Ehdr.e\\_machine](#), [Elf64\\_Ehdr.e\\_machine](#)

## Enumerator

EM_NONE	no machine
EM_M32	AT&T WE 32100.
EM_SPARC	SPARC.
EM_386	Intel 80386.
EM_68K	Motorola 68000.
EM_88K	Motorola 88000.
EM_860	Intel 80860.
EM_MIPS	MIPS RS3000 big-endian.
EM_MIPS_RS4_BE	MIPS RS4000 big-endian.
EM_SPARC64	SPARC 64-bit.
EM_PARISC	HP PA-RISC.
EM_VPP500	Fujitsu VPP500.
EM_SPARC32PLUS	Sun's V8plus.
EM_960	Intel 80960.
EM_PPC	PowerPC.
EM_V800	NEC V800.
EM_FR20	Fujitsu FR20.
EM_RH32	TRW RH-32.
EM_RCE	Motorola RCE.
EM_ARM	Advanced RISC Machines ARM.
EM_ALPHA	Digital Alpha.
EM_SH	Hitachi SuperH.
EM_SPARCV9	SPARC v9 64-bit.
EM_TRICORE	Siemens Tricore embedded processor.
EM_ARC	Argonaut RISC Core, Argonaut Techn Inc.
EM_H8_300	Hitachi H8/300.
EM_H8_300H	Hitachi H8/300H.
EM_H8S	Hitachi H8/S.
EM_H8_500	Hitachi H8/500.
EM_IA_64	HP/Intel IA-64.
EM_MIPS_X	Stanford MIPS-X.
EM_COLDIRE	Motorola Coldfire.
EM_68HC12	Motorola M68HC12.
EM_X86_64	Advanced Micro Devices x86-64.
EM_PDSP	Sony DSP Processor.
EM_FX66	Siemens FX66 microcontroller.
EM_ST9PLUS	STMicroelectronics ST9+ 8/16 mc.
EM_ST7	STmicroelectronics ST7 8 bit mc.
EM_68HC16	Motorola MC68HC16 microcontroller.
EM_68HC11	Motorola MC68HC11 microcontroller.
EM_68HC08	Motorola MC68HC08 microcontroller.
EM_68HC05	Motorola MC68HC05 microcontroller.
EM_SVX	Silicon Graphics SVx.
EM_ST19	STMicroelectronics ST19 8 bit mc.
EM_VAX	Digital VAX.
EM_CRIS	Axis Communications 32-bit embedded processor.
EM_JAVELIN	Infineon Technologies 32-bit embedded processor.
EM_FIREPATH	Element 14 64-bit DSP Processor.

## Enumerator

EM_ZSP	LSI Logic 16-bit DSP Processor.
EM_MMIX	Donald Knuth's educational 64-bit processor.
EM_HUANY	Harvard University machine-independent object files.
EM_PRISM	SiTera Prism.
EM_AVR	Atmel AVR 8-bit microcontroller.
EM_FR30	Fujitsu FR30.
EM_D10V	Mitsubishi D10V.
EM_D30V	Mitsubishi D30V.
EM_V850	NEC v850.
EM_M32R	Mitsubishi M32R.
EM_MN10300	Matsushita MN10300.
EM_MN10200	Matsushita MN10200.
EM_PJ	picoJava
EM_OPENRISC	OpenRISC 32-bit embedded processor.
EM_ARC_A5	ARC Cores Tangent-A5.
EM_XTENSA	Tensilica Xtensa Architecture.
EM_ALTERA_NIOS2	Altera Nios II.
EM_AARCH64	ARM AARCH64.
EM_TILEPRO	Tilera TILEPro.
EM_MICROBLAZE	Xilinx MicroBlaze.
EM_TILEGX	Tilera TILE-Gx.
EM_RISCV	RISC-V.

Definition at line 187 of file [elf.h](#).

**13.16.8.3.13 Elf\_ETs**

```
enum Elf_ETs
```

Object file type.

See also

[Elf32\\_Ehdr.e\\_type](#), [Elf64\\_Ehdr.e\\_type](#)

## Enumerator

ET_NONE	no file type
ET_REL	relocatable file
ET_EXEC	executable file
ET_DYN	shared object file
ET_CORE	core file
ET_LOPROC	processor-specific
ET_HIPROC	processor-specific

Definition at line 172 of file [elf.h](#).

### 13.16.8.3.14 Elf\_EVs

enum [Elf\\_EVs](#)

Object file version.

See also

[Elf32\\_Ehdr.e\\_version](#), [Elf64\\_Ehdr.e\\_version](#)

Enumerator

EV_NONE	Invalid version.
EV_CURRENT	Current version.

Definition at line 270 of file [elf.h](#).

### 13.16.8.3.15 Elf\_MAGs

enum [Elf\\_MAGs](#)

Magic number.

Enumerator

ELFMAG0	e_ident[EI_MAG0]
ELFMAG1	e_ident[EI_MAG1]
ELFMAG2	e_ident[EI_MAG2]
ELFMAG3	e_ident[EI_MAG3]

Definition at line 293 of file [elf.h](#).

### 13.16.8.3.16 Elf\_NT\_s\_core

enum [Elf\\_NT\\_s\\_core](#)

Legal values for note segment descriptor types for core files.

Enumerator

NT_PRSTATUS	Contains copy of prstatus struct.
NT_FPREGSET	Contains copy of fpregset struct.
NT_PRPSINFO	Contains copy of prpsinfo struct.
NT_PRXREG	Contains copy of prxregset struct.
NT_TASKSTRUCT	Contains copy of task structure.
NT_PLATFORM	String from sysinfo(SI_PLATFORM)
NT_AUXV	Contains copy of auxv array.
NT_GWINDOWS	Contains copy of gwindows struct.

## Enumerator

NT_ASRS	Contains copy of asrset struct.
NT_PSTATUS	Contains copy of pstatus struct.
NT_PSINFO	Contains copy of psinfo struct.
NT_PRCRED	Contains copy of prcred struct.
NT_UTSNAME	Contains copy of utsname struct.
NT_LWPSTATUS	Contains copy of lwpstatus struct.
NT_LWPSINFO	Contains copy of lwpinfo struct.
NT_PRFPXREG	Contains copy of fpxregset struct.

Definition at line 491 of file [elf.h](#).

**13.16.8.3.17 Elf\_NTs\_obj**

enum [Elf\\_NTs\\_obj](#)

Legal values for the note segment descriptor types for object files.

## Enumerator

NT_VERSION	Contains a version string.
------------	----------------------------

Definition at line 512 of file [elf.h](#).

**13.16.8.3.18 Elf\_OSABIs**

enum [Elf\\_OSABIs](#)

Identify operating system and ABI to which the object is targeted.

## Enumerator

ELFOSABI_NONE	UNIX System V ABI.
ELFOSABI_SYSV	Alias.
ELFOSABI_HPUX	HP-UX.
ELFOSABI_NETBSD	NetBSD.
ELFOSABI_LINUX	Linux.
ELFOSABI_SOLARIS	Sun Solaris.
ELFOSABI_AIX	IBM AIX.
ELFOSABI_IRIX	SGI Irix.

## Enumerator

ELFOSABI_FREEBSD	FreeBSD.
ELFOSABI_TRU64	Compaq TRU64 UNIX.
ELFOSABI_MODESTO	Novell Modesto.
ELFOSABI_OPENBSD	OpenBSD.
ELFOSABI_ARM	ARM.
ELFOSABI_STANDALONE	Standalone (embedded) application.

Definition at line 320 of file [elf.h](#).

**13.16.8.3.19 ELF\_PFs**

enum [ELF\\_PFs](#)

Segment permissions.

## Enumerator

PF_X	Executable.
PF_W	Write.
PF_R	Read.
PF_MASKOS	OS-specific.
PF_MASKPROC	Processor-specific.

Definition at line 481 of file [elf.h](#).

**13.16.8.3.20 Elf\_PTs**

enum [Elf\\_PTs](#)

Segment types.

## Enumerator

PT_NULL	array is unused
PT_LOAD	loadable
PT_DYNAMIC	dynamic linking information
PT_INTERP	path to interpreter
PT_NOTE	auxiliary information
PT_SHLIB	reserved
PT_PHDR	location of the pht itself
PT_TLS	Thread-local storage segment.
PT_NUM	Number of defined types.
PT_LOOS	OS-specific.

## Enumerator

PT_HIOS	OS-specific.
PT_LOPROC	processor-specific
PT_HIPROC	processor-specific
PT_GNU_EH_FRAME	EH frame information.
PT_GNU_STACK	Flags for stack.
PT_GNU_RELRO	Read only after reloc.
PT_L4_STACK	Address of the stack.
PT_L4_KIP	Address of the KIP.
PT_L4_AUX	Address of the AUX structures.

Definition at line 455 of file [elf.h](#).

## 13.16.8.3.21 Elf\_R\_386\_s

enum [Elf\\_R\\_386\\_s](#)

Relocation types (processor specific).

## Enumerator

R_386_NONE	none
R_386_32	S + A.
R_386_PC32	S + A - P.
R_386_GOT32	G + A - P.
R_386_PLT32	L + A - P.
R_386_COPY	none
R_386_GLOB_DAT	S.
R_386_JMP_SLOT	S.
R_386_RELATIVE	B + A.
R_386_GOTOFF	S + A - GOT.
R_386_GOTPC	GOT + A - P.
R_386_TLS_TPOFF	Offset in static TLS block.
R_386_TLS_IE	Address of GOT entry for static TLS block offset.
R_386_TLS_GOTIE	GOT entry for static TLS block offset.
R_386_TLS_LE	Offset relative to static TLS block.
R_386_TLS_GD	Direct 32 bit for GNU version of general dynamic thread local data.
R_386_TLS_LDM	Direct 32 bit for GNU version of local dynamic thread local data in LE code.
R_386_TLS_GD_32	Direct 32 bit for general dynamic thread local data.
R_386_TLS_GD_PUSH	Tag for pushl in GD TLS code.
R_386_TLS_GD_CALL	Relocation for call to <code>__tls_get_addr()</code>
R_386_TLS_GD_POP	Tag for popl in GD TLS code.
R_386_TLS_LDM_32	Direct 32 bit for local dynamic thread local data in LE code.
R_386_TLS_LDM_PUSH	Tag for pushl in LDM TLS code.
R_386_TLS_LDM_CALL	Relocation for call to <code>__tls_get_addr()</code> in LDM code.
R_386_TLS_LDM_POP	Tag for popl in LDM TLS code.
R_386_TLS_LDO_32	Offset relative to TLS block.
R_386_TLS_IE_32	GOT entry for negated static TLS block offset.

## Enumerator

R_386_TLS_LE_32	Negated offset relative to static TLS block.
R_386_TLS_DTPMOD32	ID of module containing symbol.
R_386_TLS_DTPOFF32	Offset in TLS block.
R_386_TLS_TPOFF32	Negated offset in static TLS block.
R_386_NUM	Keep this the last entry.

Definition at line 682 of file [elf.h](#).

**13.16.8.3.22 Elf\_R\_AARCH64\_s**

enum [Elf\\_R\\_AARCH64\\_s](#)

AARCH64 relocations.

## Enumerator

R_AARCH64_NONE	No reloc.
----------------	-----------

Definition at line 830 of file [elf.h](#).

**13.16.8.3.23 Elf\_R\_ARM\_s**

enum [Elf\\_R\\_ARM\\_s](#)

ARM relocations.

## Enumerator

R_ARM_NONE	No reloc.
R_ARM_PC24	PC relative 26 bit branch.
R_ARM_ABS32	Direct 32 bit
R_ARM_REL32	PC relative 32 bit.
R_ARM_ABS16	Direct 16 bit.
R_ARM_ABS12	Direct 12 bit.
R_ARM_ABS8	Direct 8 bit.
R_ARM_COPY	Copy symbol at runtime.
R_ARM_GLOB_DAT	Create GOT entry.
R_ARM_JUMP_SLOT	Create PLT entry.
R_ARM_RELATIVE	Adjust by program base.
R_ARM_GOTOFF	32 bit offset to GOT
R_ARM_GOTPC	32 bit PC relative offset to GOT
R_ARM_GOT32	32 bit GOT entry
R_ARM_PLT32	32 bit PLT address
R_ARM_THM_PC11	thumb unconditional branch
R_ARM_THM_PC9	thumb conditional branch
R_ARM_NUM	Keep this the last entry.

Definition at line 782 of file [elf.h](#).

### 13.16.8.3.24 Elf\_R\_X86\_64\_s

enum [Elf\\_R\\_X86\\_64\\_s](#)

AMD x86-64 relocations.

#### Enumerator

R_X86_64_NONE	No reloc.
R_X86_64_64	Direct 64 bit
R_X86_64_PC32	PC relative 32 bit signed.
R_X86_64_GOT32	32 bit GOT entry
R_X86_64_PLT32	32 bit PLT address
R_X86_64_COPY	Copy symbol at runtime.
R_X86_64_GLOB_DAT	Create GOT entry.
R_X86_64_JUMP_SLOT	Create PLT entry.
R_X86_64_RELATIVE	Adjust by program base.
R_X86_64_GOTPCREL	32 bit signed PC relative offset to GOT
R_X86_64_32	Direct 32 bit zero extended.
R_X86_64_32S	Direct 32 bit sign extended.
R_X86_64_16	Direct 16 bit zero extended.
R_X86_64_PC16	16 bit sign extended pc relative
R_X86_64_8	Direct 8 bit sign extended
R_X86_64_PC8	8 bit sign extended pc relative
R_X86_64_DTPMOD64	ID of module containing symbol.
R_X86_64_DTPOFF64	Offset in module's TLS block.
R_X86_64_TPOFF64	Offset in initial TLS block.
R_X86_64_TLSGD	32 bit signed PC relative offset to two GOT entries for GD symbol
R_X86_64_TLSLD	32 bit signed PC relative offset to two GOT entries for LD symbol
R_X86_64_DTPOFF32	Offset in TLS block.
R_X86_64_GOTTPOFF	32 bit signed PC relative offset to GOT entry for IE symbol
R_X86_64_TPOFF32	Offset in initial TLS block.

Definition at line 837 of file [elf.h](#).

### 13.16.8.3.25 Elf\_SHF\_s\_ARM

enum [Elf\\_SHF\\_s\\_ARM](#)

ARM-specific values for [Elf32\\_Shdr.sh\\_flags](#) / [Elf64\\_Shdr.sh\\_flags](#).

#### Enumerator

SHF_ARM_ENTRYSECT	Section contains an entry point.
SHF_ARM_COMDEF	Section may be multiply defined in the input to a link step.

Definition at line 767 of file [elf.h](#).

### 13.16.8.3.26 Elf\_SHFs

enum [Elf\\_SHFs](#)

Section attribute flags.

#### Enumerator

SHF_WRITE	writeable during execution
SHF_ALLOC	section occupies virt memory
SHF_EXECINSTR	code section
SHF_MERGE	Might be merged.
SHF_STRINGS	Contains nul-terminated strings.
SHF_INFO_LINK	'sh_info' contains SHT index
SHF_LINK_ORDER	Preserve order after combining.
SHF_OS_NONCONFORMING	Non-standard OS-specific handling required.
SHF_GROUP	Section is member of a group.
SHF_TLS	Section hold thread-local data.
SHF_MASKOS	OS-specific.
SHF_MASKPROC	processor-specific mask

Definition at line 410 of file [elf.h](#).

### 13.16.8.3.27 Elf\_SHNs

enum [Elf\\_SHNs](#)

Special section indexes.

#### Enumerator

SHN_UNDEF	undefined section header entry
SHN_LORESERVE	lower bound of reserved indexes
SHN_LOPROC	lower bound of proc spec entr
SHN_HIPROC	upper bound of proc spec entr
SHN_ABS	absolute values for ref
SHN_COMMON	common symbols
SHN_HIRESERVE	upper bound of reserved indexes

Definition at line 339 of file [elf.h](#).

### 13.16.8.3.28 Elf\_SHTs

enum [Elf\\_SHTs](#)

Section type.

Enumerator

SHT_NULL	inactive section header
SHT_PROGBITS	information defined by program
SHT_SYMTAB	symbol table
SHT_STRTAB	string table
SHT_RELA	reloc entries w/ explicit addends
SHT_HASH	symbol hash table
SHT_DYNAMIC	information for dynamic linking
SHT_NOTE	information that marks the file
SHT_NOBITS	occupies no space in the file
SHT_REL	reloc entries w/o explicit addends
SHT_SHLIB	reserved + unspecified semantics
SHT_DYNSYM	symbol table (dynamic)
SHT_INIT_ARRAY	Array of constructors.
SHT_FINI_ARRAY	Array of destructors.
SHT_PREINIT_ARRAY	Array of pre-constructors.
SHT_GROUP	Section group.
SHT_SYMTAB_SHNDX	Extended section indices.
SHT_NUM	Number of defined types.
SHT_LOOS	Start OS-specific.
SHT_HIOS	End OS-specific.
SHT_LOPROC	Start processor-specific.
SHT_HIPROC	End processor-specific.
SHT_LOUSER	Start application-specific.
SHT_HIUSER	End application-specific.

Definition at line 381 of file [elf.h](#).

### 13.16.8.3.29 Elf\_STBs

enum [Elf\\_STBs](#)

Symbol Binding.

See also

[ELF32\\_ST\\_BIND](#), [ELF64\\_ST\\_BIND](#)

Enumerator

STB_LOCAL	not visible outside object file
STB_GLOBAL	visible to all objects being combined
STB_WEAK	resemble global symbols
STB_LOOS	OS-specific.
STB_HIOS	OS-specific.
STB_LOPROC	Processor-specific.
STB_HIPROC	Processor-specific.

Generated by Doxygen 1.8.17

Definition at line 917 of file [elf.h](#).

### 13.16.8.3.30 Elf\_STTs

enum [Elf\\_STTs](#)

Symbol Types.

See also

[ELF32\\_ST\\_TYPE](#), [ELF64\\_ST\\_TYPE](#)

Enumerator

STT_NOTYPE	symbol's type not specified
STT_OBJECT	associated with a data object
STT_FUNC	associated with a function or other code
STT_SECTION	associated with a section
STT_FILE	source file name associated with object
STT_LOOS	OS-specific.
STT_HIOS	OS-specific.
STT_LOPROC	processor-specific
STT_HIPROC	processor-specific

Definition at line 930 of file [elf.h](#).

## 13.16.9 Functions to manipulate the local IDT

Collaboration diagram for Functions to manipulate the local IDT:

### Data Structures

- struct [l4util\\_idt\\_desc\\_t](#)  
*IDT entry.*
- struct [l4util\\_idt\\_header\\_t](#)  
*Header of an IDT table.*

### 13.16.9.1 Detailed Description

## 13.16.10 IA32 Port I/O API

Collaboration diagram for IA32 Port I/O API:

### Functions

- `l4_uint8_t l4util_in8 (l4_uint16_t port)`  
*Read byte from I/O port.*
- `l4_uint16_t l4util_in16 (l4_uint16_t port)`  
*Read 16-bit-value from I/O port.*
- `l4_uint32_t l4util_in32 (l4_uint16_t port)`  
*Read 32-bit-value from I/O port.*
- `void l4util_ins8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 8-bit-values from I/O ports.*
- `void l4util_ins16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 16-bit-values from I/O ports.*
- `void l4util_ins32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 32-bit-values from I/O ports.*
- `void l4util_out8 (l4_uint8_t value, l4_uint16_t port)`  
*Write byte to I/O port.*
- `void l4util_out16 (l4_uint16_t value, l4_uint16_t port)`  
*Write 16-bit-value to I/O port.*
- `void l4util_out32 (l4_uint32_t value, l4_uint16_t port)`  
*Write 32-bit-value to I/O port.*
- `void l4util_outs8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write a block of bytes to I/O port.*
- `void l4util_outs16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write a block of 16-bit-values to I/O port.*
- `void l4util_outs32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write block of 32-bit-values to I/O port.*
- `void l4util_iodelay (void)`  
*delay I/O port access by writing to port 0x80*

### 13.16.10.1 Detailed Description

### 13.16.10.2 Function Documentation

#### 13.16.10.2.1 l4util\_in16()

```
l4_uint16_t l4util_in16 (
    l4_uint16_t port ) [inline]
```

Read 16-bit-value from I/O port.

**Parameters**

<i>port</i>	I/O port address
-------------	------------------

**Returns**

value

Definition at line 180 of file [port\\_io.h](#).

**13.16.10.2.2 l4util\_in32()**

```
l4_uint32_t l4util_in32 (  
    l4_uint16_t port ) [inline]
```

Read 32-bit-value from I/O port.

**Parameters**

<i>port</i>	I/O port address
-------------	------------------

**Returns**

value

Definition at line 188 of file [port\\_io.h](#).

**13.16.10.2.3 l4util\_in8()**

```
l4_uint8_t l4util_in8 (  
    l4_uint16_t port ) [inline]
```

Read byte from I/O port.

**Parameters**

<i>port</i>	I/O port address
-------------	------------------

**Returns**

value

Definition at line 172 of file [port\\_io.h](#).

Referenced by [l4util\\_irq\\_acknowledge\(\)](#).

Here is the caller graph for this function:

#### 13.16.10.2.4 l4util\_ins16()

```
void l4util_ins16 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count ) [inline]
```

Read a block of 16-bit-values from I/O ports.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 205 of file [port\\_io.h](#).

#### 13.16.10.2.5 l4util\_ins32()

```
void l4util_ins32 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count ) [inline]
```

Read a block of 32-bit-values from I/O ports.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 214 of file [port\\_io.h](#).

#### 13.16.10.2.6 l4util\_ins8()

```
void l4util_ins8 (
    l4_uint16_t port,
```

```
14_umword_t addr,  
14_umword_t count ) [inline]
```

Read a block of 8-bit-values from I/O ports.

#### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 196 of file [port\\_io.h](#).

#### 13.16.10.2.7 l4util\_out16()

```
void l4util_out16 (  
    14_uint16_t value,  
    14_uint16_t port ) [inline]
```

Write 16-bit-value to I/O port.

#### Parameters

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 229 of file [port\\_io.h](#).

#### 13.16.10.2.8 l4util\_out32()

```
void l4util_out32 (  
    14_uint32_t value,  
    14_uint16_t port ) [inline]
```

Write 32-bit-value to I/O port.

#### Parameters

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 235 of file [port\\_io.h](#).

#### 13.16.10.2.9 l4util\_out8()

```
void l4util_out8 (  
    14_uint8_t value,  
    14_uint16_t port ) [inline]
```

Write byte to I/O port.

## Parameters

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 223 of file [port\\_io.h](#).

Referenced by [l4util\\_irq\\_acknowledge\(\)](#).

Here is the caller graph for this function:

#### 13.16.10.2.10 l4util\_outs16()

```
void l4util_outs16 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count ) [inline]
```

Write a block of 16-bit-values to I/O port.

## Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 250 of file [port\\_io.h](#).

#### 13.16.10.2.11 l4util\_outs32()

```
void l4util_outs32 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count ) [inline]
```

Write block of 32-bit-values to I/O port.

## Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 259 of file [port\\_io.h](#).

#### 13.16.10.2.12 l4util\_outs8()

```
void l4util_outs8 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count ) [inline]
```

Write a block of bytes to I/O port.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 241 of file [port\\_io.h](#).

### 13.16.11 Internal functions

Collaboration diagram for Internal functions:

#### Functions

- void **base64\_encode** (const char \*infile, unsigned int in\_size, char \*\*outfile)  
*base-64-encode string infile*
- void **base64\_decode** (const char \*infile, unsigned int in\_size, char \*\*outfile)  
*decode base-64-encoded string infile*

### 13.16.11.1 Detailed Description

## 13.16.12 Kernel Interface Page API

Collaboration diagram for Kernel Interface Page API:

### Files

- file [kip.h](#)

### Macros

- `#define l4util_kip_for_each_feature(s) l4_kip_for_each_feature(s)`  
*Cycle through kernel features given in the KIP.*

### Functions

- `int l4util_kip_kernel_is_ux (l4_kernel_info_t const *k)`  
*Return whether the kernel is running natively or under UX.*
- `int l4util_kip_kernel_has_feature (l4_kernel_info_t const *k, char const *str)`  
*Check if kernel supports a feature.*
- `unsigned long l4util_kip_kernel_abi_version (l4_kernel_info_t const *k)`  
*Return kernel ABI version.*

### 13.16.12.1 Detailed Description

### 13.16.12.2 Macro Definition Documentation

#### 13.16.12.2.1 l4util\_kip\_for\_each\_feature

```
#define l4util_kip_for_each_feature(
    s ) l4_kip_for_each_feature(s)
```

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. `s` must be a character pointer (`char const *`) initialized with [l4\\_kip\\_version\\_string\(\)](#).

**Deprecated** Use [l4\\_kip\\_for\\_each\\_feature\(\)](#).

Definition at line 68 of file [kip.h](#).

### 13.16.12.3 Function Documentation

#### 13.16.12.3.1 l4util\_kip\_kernel\_abi\_version()

```
unsigned long l4util_kip_kernel_abi_version (
    l4_kernel_info_t const * k )
```

Return kernel ABI version.

##### Parameters

<i>k</i>	Pointer to the kernel info page (KIP).
----------	--

##### Returns

Kernel ABI version.

#### 13.16.12.3.2 l4util\_kip\_kernel\_has\_feature()

```
int l4util_kip_kernel_has_feature (
    l4_kernel_info_t const * k,
    char const * str )
```

Check if kernel supports a feature.

##### Parameters

<i>k</i>	Pointer to the kernel info page (KIP).
<i>str</i>	Feature name to check.

##### Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

**Deprecated** Use [l4\\_kip\\_kernel\\_has\\_feature\(\)](#).

#### 13.16.12.3.3 l4util\_kip\_kernel\_is\_ux()

```
int l4util_kip_kernel_is_ux (
    l4_kernel_info_t const * k )
```

Return whether the kernel is running natively or under UX.

#### Parameters

<i>k</i>	Pointer to the kernel info page (KIP).
----------	--

#### Returns

1 when running under UX, 0 if not running under UX.

#### Examples

[examples/sys/ux-vhw/main.c](#).

### 13.16.13 Low-Level Thread Functions

Collaboration diagram for Low-Level Thread Functions:

### 13.16.14 Random number support

Collaboration diagram for Random number support:

#### Functions

- [l4\\_uint32\\_t l4util\\_rand](#) (void)  
*Deliver next random number.*
- void [l4util\\_srand](#) ([l4\\_uint32\\_t](#) seed)  
*Initialize random number generator.*

### 13.16.14.1 Detailed Description

### 13.16.14.2 Function Documentation

#### 13.16.14.2.1 l4util\_rand()

```
l4_uint32_t l4util_rand (
    void )
```

Deliver next random number.

#### Returns

A new random number

#### 13.16.14.2.2 l4util\_srand()

```
void l4util_srand (
    l4_uint32_t seed )
```

Initialize random number generator.

#### Parameters

<i>seed</i>	Value to initialize
-------------	---------------------

## 13.16.15 Timestamp Counter

Collaboration diagram for Timestamp Counter:

#### Files

- file [rdtsc.h](#)  
*Timestamp counter related functions.*
- file [rdtsc.h](#)  
*Timestamp counter related functions.*

## Functions

- [l4\\_cpu\\_time\\_t l4\\_rdtsc](#) (void)  
*Read current value of CPU-internal timestamp counter.*
- [l4\\_uint32\\_t l4\\_rdtsc\\_32](#) (void)  
*Read the lest significant 32 bit of the TSC.*
- [l4\\_uint64\\_t l4\\_rdpmc](#) (int ecx)  
*Return current value of CPU-internal performance measurement counter.*
- [l4\\_uint32\\_t l4\\_rdpmc\\_32](#) (int ecx)  
*Return the least significant 32 bit of a performance counter.*
- [l4\\_uint64\\_t l4\\_tsc\\_to\\_ns](#) ([l4\\_cpu\\_time\\_t](#) tsc)  
*Convert timestamp to ns value.*
- [l4\\_uint64\\_t l4\\_tsc\\_to\\_us](#) ([l4\\_cpu\\_time\\_t](#) tsc)  
*Convert timestamp into micro seconds value.*

### 13.16.15.1 Detailed Description

### 13.16.15.2 Function Documentation

#### 13.16.15.2.1 l4\_busy\_wait\_ns()

```
void l4_busy_wait_ns (
    l4\_uint64\_t ns ) [inline]
```

Wait busy for a small amount of time.

#### Parameters

<a href="#">ns</a>	nano seconds to wait
--------------------	----------------------

#### Attention

Not intended for any use!

Definition at line 264 of file [rdtsc.h](#).

References [l4\\_ns\\_to\\_tsc\(\)](#), and [l4\\_rdtsc\(\)](#).

Here is the call graph for this function:

#### 13.16.15.2.2 l4\_busy\_wait\_us()

```
void l4_busy_wait_us (
    l4_uint64_t us ) [inline]
```

Wait busy for a small amount of time.

##### Parameters

<i>us</i>	micro seconds to wait
-----------	-----------------------

##### Attention

Not intended for any use!

Definition at line [274](#) of file [rdtsc.h](#).

References [l4\\_ns\\_to\\_tsc\(\)](#), and [l4\\_rdtsc\(\)](#).

Here is the call graph for this function:

### 13.16.15.2.3 l4\_calibrate\_tsc()

```
l4_uint32_t l4_calibrate_tsc (
    l4_kernel_info_t const * kip ) [inline]
```

Determine scalers for timestamp calculations.

Determine some scalers to be able to convert between real time and CPU ticks. Just calls [l4\\_tsc\\_init\(\)](#).

#### Examples

[examples/sys/aliens/main.c](#).

Definition at line 161 of file [rdtsc.h](#).

References [l4\\_tsc\\_init\(\)](#).

Here is the call graph for this function:

### 13.16.15.2.4 l4\_get\_hz()

```
l4_uint32_t l4_get_hz (
    void )
```

Get CPU frequency in Hz.

#### Returns

frequency in Hz

### 13.16.15.2.5 l4\_ns\_to\_tsc()

```
l4_cpu_time_t l4_ns_to_tsc (
    l4_uint64_t ns ) [inline]
```

Convert nano seconds into CPU ticks.

#### Parameters

<i>ns</i>	nano seconds
-----------	--------------

**Returns**

CPU ticks

Definition at line 250 of file [rdtsc.h](#).

Referenced by [l4\\_busy\\_wait\\_ns\(\)](#), and [l4\\_busy\\_wait\\_us\(\)](#).

Here is the caller graph for this function:

**13.16.15.2.6 l4\_rdpmc()**

```
l4_uint64_t l4_rdpmc (
    int ecx ) [inline]
```

Return current value of CPU-internal performance measurement counter.

**Parameters**

<code>ecx</code>	ECX value for the rdpmc instruction. For details see the Intel IA-32 Architectures Software Developer's Manual.
------------------	---

**Returns**

64-bit PMC

Definition at line 177 of file [rdtsc.h](#).

**13.16.15.2.7 l4\_rdpmc\_32()**

```
l4_uint32_t l4_rdpmc_32 (
    int ecx ) [inline]
```

Return the least significant 32 bit of a performance counter.

Useful for smaller differences, needs less cycles.

Definition at line 197 of file [rdtsc.h](#).

### 13.16.15.2.8 l4\_rdtsc()

```
l4_cpu_time_t l4_rdtsc (
    void ) [inline]
```

Read current value of CPU-internal timestamp counter.

#### Returns

64-bit timestamp

#### Examples

[examples/sys/aliens/main.c](#).

Definition at line 167 of file [rdtsc.h](#).

Referenced by [l4\\_busy\\_wait\\_ns\(\)](#), and [l4\\_busy\\_wait\\_us\(\)](#).

Here is the caller graph for this function:

### 13.16.15.2.9 l4\_rdtsc\_32()

```
l4_uint32_t l4_rdtsc_32 (
    void ) [inline]
```

Read the lest significant 32 bit of the TSC.

Useful for smaller differences, needs less cycles.

Definition at line 187 of file [rdtsc.h](#).

### 13.16.15.2.10 l4\_tsc\_init()

```
l4_uint32_t l4_tsc_init (
    l4_kernel_info_t const * kip )
```

Initialize scaler for TSC calibrations from the kernel.

Initialize the scalers needed by [l4\\_tsc\\_to\\_ns\(\)](#)/[l4\\_ns\\_to\\_tsc\(\)](#) and so on. Use the kernel-provided frequency.

## Parameters

<i>kip</i>	KIP pointer
------------	-------------

## Returns

0 on error (no scalars exported by kernel) otherwise returns ( $2^{32} / (\text{tsc per } \mu\text{sec})$ ). This value has the same semantics as the value returned by the `calibrate_delay_loop()` function of the Linux kernel.

Referenced by [l4\\_calibrate\\_tsc\(\)](#).

Here is the caller graph for this function:

**13.16.15.2.11 l4\_tsc\_to\_ns()**

```
l4_uint64_t l4_tsc_to_ns (
    l4_cpu_time_t tsc ) [inline]
```

Convert timestamp to ns value.

## Parameters

<i>tsc</i>	time value in CPU ticks
------------	-------------------------

## Returns

time value in ns

## Examples

[examples/sys/aliens/main.c](#).

Definition at line 207 of file [rdtsc.h](#).

**13.16.15.2.12 l4\_tsc\_to\_s\_and\_ns()**

```
void l4_tsc_to_s_and_ns (
    l4_cpu_time_t tsc,
    l4_uint32_t * s,
    l4_uint32_t * ns ) [inline]
```

Convert timestamp to s.ns value.

**Parameters**

	<i>tsc</i>	time value in CPU ticks
out	<i>s</i>	seconds
out	<i>ns</i>	nano seconds

Definition at line 235 of file [rdtsc.h](#).

**13.16.15.2.13 l4\_tsc\_to\_us()**

```
l4_uint64_t l4_tsc_to_us (
    l4_cpu_time_t tsc ) [inline]
```

Convert timestamp into micro seconds value.

**Parameters**

<i>tsc</i>	time value in CPU ticks
------------	-------------------------

**Returns**

time value in micro seconds

Definition at line 221 of file [rdtsc.h](#).

*Return whether the entry reason was a page fault.*

### 13.17.1 Detailed Description

vCPU handling functionality.

This library provides convenience functionality on top of the l4sys vCPU interface to ease programming. It wraps commonly used code and abstracts architecture depends parts as far as reasonable.

### 13.17.2 Function Documentation

#### 13.17.2.1 l4vcpu\_irq\_disable()

```
void l4vcpu_irq_disable (
    l4\_vcpu\_state\_t * vcpu ) [inline]
```

Disable a vCPU for event delivery.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

Definition at line 212 of file [vcpu.h](#).

References [l4\\_barrier\(\)](#).

Referenced by [L4vcpu::Vcpu::irq\\_disable\(\)](#), [l4vcpu\\_irq\\_disable\\_save\(\)](#), and [l4vcpu\\_irq\\_restore\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.17.2.2 l4vcpu\_irq\_disable\_save()

```
unsigned l4vcpu_irq_disable_save (
    l4_vcpu_state_t * vcpu ) [inline]
```

Disable a vCPU for event delivery and return previous state.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

#### Returns

IRQ state before disabling IRQs.

Definition at line 220 of file [vcpu.h](#).

References [l4vcpu\\_irq\\_disable\(\)](#).

Referenced by [L4vcpu::Vcpu::irq\\_disable\\_save\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.17.2.3 l4vcpu\_irq\_enable()

```

void l4vcpu_irq_enable (
    l4_vcpu_state_t * vcpu,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc ) [inline]
  
```

Enable a vCPU for event delivery.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>utcb</i>	Utc b pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

Definition at line 243 of file [vcpu.h](#).

References [l4\\_barrier\(\)](#), [L4\\_IPC\\_BOTH\\_TIMEOUT\\_0](#), [L4\\_LIKELY](#), [L4\\_VCPU\\_F\\_IRQ](#), and [L4\\_VCPU\\_SF\\_IRQ\\_PENDING](#).

Referenced by [L4vcpu::Vcpu::irq\\_enable\(\)](#), and [l4vcpu\\_irq\\_restore\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.17.2.4 l4vcpu\_irq\_restore()

```

void l4vcpu_irq_restore (
    l4_vcpu_state_t * vcpu,
    unsigned s,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc ) [inline]
  
```

Restore a previously saved IRQ/event state.

##### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>s</i>	IRQ state to be restored.
<i>utcb</i>	Utc pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending after enabling.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

Definition at line 268 of file [vcpu.h](#).

References [L4\\_VCPU\\_F\\_IRQ](#), [l4vcpu\\_irq\\_disable\(\)](#), and [l4vcpu\\_irq\\_enable\(\)](#).

Referenced by [L4vcpu::Vcpu::irq\\_restore\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.17.2.5 l4vcpu\_is\_irq\_entry()

```
int l4vcpu_is_irq_entry (
    l4_vcpu_state_t const * vcpu ) [inline]
```

Return whether the entry reason was an IRQ/IPC message.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

return 0 if not, !=0 otherwise.

Referenced by [L4vcpu::Vcpu::is\\_irq\\_entry\(\)](#).

Here is the caller graph for this function:

### 13.17.2.6 l4vcpu\_is\_page\_fault\_entry()

```
int l4vcpu_is_page_fault_entry (
    l4_vcpu_state_t const * vcpu ) [inline]
```

Return whether the entry reason was a page fault.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

return 0 if not, !=0 otherwise.

Referenced by [L4vcpu::Vcpu::is\\_page\\_fault\\_entry\(\)](#).

Here is the caller graph for this function:

### 13.17.2.7 l4vcpu\_print\_state()

```
void l4vcpu_print_state (
    const l4_vcpu_state_t * vcpu,
    const char * prefix )
```

Print the state of a vCPU.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>prefix</i>	A prefix for each line printed.

Referenced by [L4vcpu::Vcpu::print\\_state\(\)](#).

Here is the caller graph for this function:

### 13.17.2.8 l4vcpu\_wait\_for\_event()

```

void l4vcpu_wait_for_event (
    l4_vcpu_state_t * vcpu,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc ) [inline]
  
```

Wait for event.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>utcb</i>	Utc b pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called when the vCPU awakes and needs to handle an event/IRQ.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation.

Note that event delivery remains disabled after this function returns.

Definition at line 281 of file [vcpu.h](#).

References [L4\\_IPC\\_NEVER](#).

Referenced by [L4vcpu::Vcpu::wait\\_for\\_event\(\)](#).

Here is the caller graph for this function:

### 13.17.3 Extended vCPU support

Extended vCPU handling functionality.

Collaboration diagram for Extended vCPU support:

#### Functions

- `int l4vcpu_ext_alloc (l4_vcpu_state_t **vcpu, l4_addr_t *ext_state, l4_cap_idx_t task, l4_cap_idx_t regmgr)`  
`L4_NOTHROW`

*Allocate state area for an extended vCPU.*

#### 13.17.3.1 Detailed Description

Extended vCPU handling functionality.

#### 13.17.3.2 Function Documentation

##### 13.17.3.2.1 l4vcpu\_ext\_alloc()

```

int l4vcpu_ext_alloc (
    l4_vcpu_state_t ** vcpu,
    l4_addr_t * ext_state,
    l4_cap_idx_t task,
    l4_cap_idx_t regmgr )
  
```

Allocate state area for an extended vCPU.

#### Parameters

out	<i>vcpu</i>	Allocated vcpu-state area.
out	<i>ext_state</i>	Allocated extended vcpu-state area.
	<i>task</i>	Task to use for allocation.
	<i>regmgr</i>	Region manager to use for allocation.

#### Returns

0 for success, error code otherwise

# Chapter 14

## Namespace Documentation

### 14.1 cxx Namespace Reference

Our C++ library.

#### Namespaces

- namespace [Bits](#)  
*Internal helpers for the cxx package.*

#### Data Structures

- class [Avl\\_map](#)  
*AVL tree based associative container.*
- class [Avl\\_set](#)  
*AVL set for simple comparable items.*
- class [Avl\\_tree](#)  
*A generic AVL tree.*
- class [Avl\\_tree\\_node](#)  
*Node of an AVL tree.*
- class [Base\\_slab](#)  
*Basic slab allocator.*
- class [Base\\_slab\\_static](#)  
*Merged slab allocator (allocators for objects of the same size are merged together).*
- class [Bitfield](#)  
*Definition for a member (part) of a bit field.*
- class [Bitmap](#)  
*A static bitmap.*
- class [Bitmap\\_base](#)  
*Basic bitmap abstraction.*
- class [H\\_list](#)  
*General double-linked list of unspecified [cxx::H\\_list\\_item](#) elements.*
- class [H\\_list\\_item\\_t](#)  
*Basic element type for a double-linked [H\\_list](#).*

- struct [H\\_list\\_t](#)  
*Double-linked list of typed [H\\_list\\_item\\_t](#) elements.*
- class [List](#)  
*Doubly linked list, with internal allocation.*
- class [List\\_alloc](#)  
*Standard list-based allocator.*
- class [List\\_item](#)  
*Basic list item.*
- struct [Lt\\_functor](#)  
*Generic comparator class that defaults to the less-than operator.*
- class [New\\_allocator](#)  
*Standard allocator based on `operator new ()`.*
- class [Nothrow](#)  
*Helper type to distinguish the `operator new` version that does not throw exceptions.*
- struct [Pair](#)  
*Pair of two values.*
- class [Pair\\_first\\_compare](#)  
*Comparison functor for [Pair](#).*
- struct [Ref\\_obj\\_list\\_item](#)  
*Item for list linked via [cxx::Ref\\_ptr](#) with default reference counting.*
- class [Ref\\_ptr](#)  
*A reference-counting pointer with automatic cleanup.*
- class [S\\_list](#)  
*Simple single-linked list.*
- class [Slab](#)  
*[Slab](#) allocator for object of type `Type`.*
- class [Slab\\_static](#)  
*Merged slab allocator (allocators for objects of the same size are merged together).*
- class [static\\_vector](#)  
*Simple encapsulation for a dynamically allocated array.*
- class [String](#)  
*Allocation free string class with explicit length field.*
- class [Weak\\_ref](#)  
*Typed weak reference to an object of type `T`.*
- class [Weak\\_ref\\_base](#)  
*Generic (base) weak reference to some object.*

## Typedefs

- typedef [H\\_list\\_item\\_t](#)< void > [H\\_list\\_item](#)  
*Untyped list item.*

- template<typename T >  
using [Ref\\_ptr\\_list](#) = [Bits::Smart\\_ptr\\_list](#)< [Ref\\_ptr\\_list\\_item](#)< T > >  
*Single-linked list where elements are connected via a [cxx::Ref\\_ptr](#).*
- template<typename T >  
using [Unique\\_ptr\\_list\\_item](#) = [Bits::Smart\\_ptr\\_list\\_item](#)< T, [cxx::unique\\_ptr](#)< T > >  
*Item for list linked with [cxx::unique\\_ptr](#).*
- template<typename T >  
using [Unique\\_ptr\\_list](#) = [Bits::Smart\\_ptr\\_list](#)< [Unique\\_ptr\\_list\\_item](#)< T > >  
*Single-linked list where elements are connected with a [cxx::unique\\_ptr](#).*

## Functions

- `template<typename A , typename ... ARGS>`  
`constexpr A const & min (A const &a1, A const &a2, ARGS const &...a)`  
*Get the minimum of a1 and a2 upt to aN.*
- `template<typename A , typename ... ARGS>`  
`constexpr A const & min (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)`  
*Get the minimum of a1 and a2 upt to aN.*
- `template<typename A , typename ... ARGS>`  
`constexpr A const & max (A const &a1, A const &a2, ARGS const &...a)`  
*Get the maximum of a1 and a2 upt to aN.*
- `template<typename A , typename ... ARGS>`  
`constexpr A const & max (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)`  
*Get the maximum of a1 and a2 upt to aN.*
- `template<typename T1 >`  
`T1 clamp (T1 v, T1 lo, T1 hi)`  
*Limit v to the range given by lo and hi.*
- `template<typename T >`  
`T access\_once (T const *a)`  
*Read the value at an address at most once.*
- `template<typename T , typename VAL >`  
`void write\_now (T *a, VAL &&val)`  
*Write a value at an address exactly once.*

### 14.1.1 Detailed Description

Our C++ library.

Small Low-Level C++ Library.

Strings.

Various kinds of C++ utilities.

### 14.1.2 Function Documentation

#### 14.1.2.1 `access_once()`

```
template<typename T >
T cxx::access_once (
    T const * a ) [inline]
```

Read the value at an address at most once.

The read might be omitted if the result is not used by any code unless `typename` contains `volatile`. If the read operation has side effects and must not be omitted, use different means like [L4drivers::Mmio\\_register\\_block](#) or similar.

The compiler is disallowed to reuse a previous read at the same address, for example:

```
val1 = *a;
val2 = access\_once(a); // compiler may not replace this by val2 = val1;
```

The compiler is also disallowed to repeat the read, for example:

```
val1 = access\_once(a);
val2 = val1; // compiler may not replace this by val2 = *a;
```

The above implies that the compiler is also disallowed to move the read out of or into loops.

## 14.2 cxx::Bits Namespace Reference

Internal helpers for the cxx package.

### Data Structures

- struct [Avl\\_map\\_get\\_key](#)  
*Key-getter for [Avl\\_map](#).*
- struct [Avl\\_set\\_get\\_key](#)  
*Internal, key-getter for [Avl\\_set](#) nodes.*
- class [Base\\_avl\\_set](#)  
*Internal: AVL set with internally managed nodes.*
- class [Basic\\_list](#)  
*Internal: Common functions for all head-based list implementations.*
- class [Bst](#)  
*Basic binary search tree (BST).*
- class [Bst\\_node](#)  
*Basic type of a node in a binary search tree (BST).*
- struct [Direction](#)  
*The direction to go in a binary search tree.*
- class [Smart\\_ptr\\_list](#)  
*List of smart-pointer-managed objects.*
- class [Smart\\_ptr\\_list\\_item](#)  
*List item for an arbitrary item in a [Smart\\_ptr\\_list](#).*

### 14.2.1 Detailed Description

Internal helpers for the cxx package.

## 14.3.1 Detailed Description

[L4](#) low-level kernel interface.

## 14.3.2 Enumeration Type Documentation

### 14.3.2.1 anonymous enum

`anonymous enum`

Enumerator

<code>PROTO_ANY</code>	Default protocol used by <a href="#">Kobject_t</a> and <a href="#">Kobject_x</a> .
<code>PROTO_EMPTY</code>	Empty protocol for empty APIs.

Definition at line 55 of file [\\_\\_typeinfo.h](#).

### 14.3.3 Function Documentation

#### 14.3.3.1 `cap_cast()` [1/2]

```
template<typename T , typename F >
Cap< T > L4::cap_cast (
    Cap< F > const & c ) [inline], [noexcept]
```

`static_cast` for capabilities.

##### Template Parameters

<i>T</i>	The target type of the capability
<i>F</i>	The source type (and is usually implicitly set)

##### Parameters

<i>c</i>	The source capability that shall be casted
----------	--

##### Returns

A capability typed to the interface *T*.

The use of this cast operator is similar to the `static_cast<>()` for C++ pointers. It does the same type checking and adjustments like C++ does on pointers.

Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_cast<L4::Icu>(obj);
```

Definition at line 411 of file [capability.h](#).

#### 14.3.3.2 `cap_cast()` [2/2]

```
template<typename T , typename F , typename SMART >
Smart_cap< T, SMART > L4::cap_cast (
    Smart_cap< F, SMART > const & c ) [inline], [noexcept]
```

`static_cast` for (smart) capabilities.

##### Template Parameters

<i>T</i>	Type to cast the capability to.
<i>F</i>	(implicit) Type of the passed capability.
<i>SMART</i>	(implicit) Class implementing the <a href="#">Smart_cap</a> interface.

## Parameters

<i>c</i>	Capability to be casted.
----------	--------------------------

## Returns

A smart capability with new type *T*.

Definition at line 203 of file [smart\\_capability](#).

**14.3.3.3 cap\_dynamic\_cast()**

```
template<typename T , typename F >
Cap< T > L4::cap_dynamic_cast (
    Cap< F > const & c ) [inline], [noexcept]
```

`dynamic_cast` for capabilities.

## Template Parameters

<i>T</i>	The target type of the capability.
<i>F</i>	The source type (is usually implicitly set).

## Parameters

<i>c</i>	The source capability that shall be casted.
----------	---

## Return values

<i>Cap&lt;T&gt;</i>	Capability of target interface <i>T</i> .
<i>L4_INVALID_CAP</i>	<i>c</i> does not support the target interface <i>T</i> or the <a href="#">L4::Meta</a> interface.

The use of this cast operator is similar to the `dynamic_cast<>()` for C++ pointers. It also induces overhead, because it uses the meta interface ([L4::Meta](#)) to do runtime type checking.

## Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_dynamic_cast<L4::Icu>(obj);
```

Definition at line 126 of file [capability](#).

References [l4\\_error\(\)](#).

Here is the call graph for this function:

#### 14.3.3.4 cap\_reinterpret\_cast() [1/2]

```

template<typename T , typename F >
Cap< T > L4::cap_reinterpret_cast (
    Cap< F > const & c ) [inline], [noexcept]
  
```

reinterpret\_cast for capabilities.

##### Template Parameters

<i>T</i>	The target type of the capability
<i>F</i>	The source type (and is usually implicitly set)

##### Parameters

<i>c</i>	The source capability that shall be casted
----------	--

##### Returns

A capability typed to the interface T.

The use of this cast operator is similar to the `reinterpret_cast<>()` for C++ pointers. It does not do any type checking or type adjustment.

Example code:

```

L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_reinterpret_cast<L4::Icu>(obj);
  
```

Definition at line 442 of file [capability.h](#).

#### 14.3.3.5 cap\_reinterpret\_cast() [2/2]

```

template<typename T , typename F , typename SMART >
Smart_cap< T, SMART > L4::cap_reinterpret_cast (
    Smart_cap< F, SMART > const & c ) [inline], [noexcept]
  
```

reinterpret\_cast for (smart) capabilities.

## Template Parameters

<i>T</i>	Type to cast the capability to.
<i>F</i>	(implicit) Type of the passed capability.
<i>SMART</i>	(implicit) Class implementing the <a href="#">Smart_cap</a> interface.

## Parameters

<i>c</i>	Capability to be casted.
----------	--------------------------

## Returns

A smart capability with new type *T*.

Definition at line [222](#) of file [smart\\_capability](#).

## 14.3.3.6 round\_order()

```
template<typename T >
constexpr T L4::round_order (
    T val,
    unsigned char order ) [constexpr]
```

Round a value up so the given number of lsb is zero.

## Template Parameters

<i>T</i>	The type of the value (shall be some integral type).
----------	--

## Parameters

<i>val</i>	The value to round up to the next multiple of 2 <sup>order</sup> .
<i>order</i>	order (2 <sup>order</sup> ) to round up to.

## Returns

*val* rounded up to the next 2<sup>order</sup>.

Definition at line [32](#) of file [consts](#).

Referenced by [L4Re::Dataspace::map\\_region\(\)](#).

Here is the caller graph for this function:

#### 14.3.3.7 trunc\_order()

```

template<typename T >
constexpr T L4::trunc_order (
    T val,
    unsigned char order ) [constexpr]
  
```

Round a value down so the given number of lsb is zero.

##### Template Parameters

<i>T</i>	The type of the value (shall be some integral type).
----------	--

##### Parameters

<i>val</i>	The value where the given lsb shall be masked.
<i>order</i>	the number of least significant bits (lsb) to mask.

##### Returns

`val` with `order` lsb masked to zero.

Definition at line 18 of file [consts](#).

Referenced by [L4Re::Dataspace::map\\_region\(\)](#).

Here is the caller graph for this function:

### 14.4.1 Detailed Description

IPC related functionality.

### 14.4.2 Function Documentation

#### 14.4.2.1 buf\_cp\_in()

```
template<typename T >
Internal::Buf_cp_in< T > L4::Ipc::buf_cp_in (
    T * v,
    unsigned long & size )
```

Extract an array from an [lpc::Istream](#).

##### Parameters

	<i>v</i>	Pointer to the array that shall receive the values from the <a href="#">lpc::Istream</a> .
<i>in, out</i>	<i>size</i>	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

[buf\\_cp\\_in\(\)](#) can be used to extract an array from an [lpc::Istream](#). This is the counterpart [buf\\_cp\\_out\(\)](#). The data from the received message is thereby copied to the given buffer and size is set to the number of elements found in the stream. To avoid the copy operation [buf\\_in\(\)](#) may be used instead.

##### See also

[buf\\_in\(\)](#) and [buf\\_cp\\_out\(\)](#).

Definition at line 170 of file [ipc\\_stream](#).

#### 14.4.2.2 buf\_cp\_out()

```
template<typename T >
Internal::Buf_cp_out< T > L4::Ipc::buf_cp_out (
    T const * v,
    unsigned long size )
```

Insert an array into an [lpc::Ostream](#).

##### Parameters

<i>v</i>	Pointer to the array that shall be inserted into an <a href="#">lpc::Ostream</a> .
<i>size</i>	Number of elements in the array.

This function inserts an array (e.g. a string) into an [lpc::Ostream](#). The data is copied to the stream. On insertion into the [lpc::Ostream](#) exactly the given number of elements of type T are copied to the message buffer, this means the source buffer is no longer referenced after insertion into the stream.

**See also**

The counterpart is either [buf\\_cp\\_in\(\)](#) or [buf\\_in\(\)](#).

Definition at line 111 of file [ipc\\_stream](#).

**14.4.2.3 buf\_in()**

```
template<typename T >
Internal::Buf_in< T > L4::Ipc::buf_in (
    T *& v,
    unsigned long & size )
```

Return a pointer to stream array data.

**Parameters**

out	<i>v</i>	Pointer to the array within the <a href="#">lpc::lstream</a> .
out	<i>size</i>	The number of elements found in the stream.

This routine provides a possibility to extract an array from an [lpc::lstream](#), without extra copy overhead. In contrast to [buf\\_cp\\_in\(\)](#) the data is not copied to a buffer, but a pointer to the array is returned. The user must make sure the UTCB is not used for other purposes while the returned pointer is still in use.

The mechanism is comparable to that of [Msg\\_ptr](#), however it handles arrays inserted with [buf\\_cp\\_out\(\)](#).

**See also**

[buf\\_cp\\_in\(\)](#) and [buf\\_cp\\_out\(\)](#).

Definition at line 321 of file [ipc\\_stream](#).

**14.4.2.4 make\_cap()**

```
template<typename T >
Cap< T > L4::Ipc::make_cap (
    L4::Cap< T > cap,
    unsigned rights ) [noexcept]
```

Make an L4::lpc::Cap<T> for the given capability and rights.

**Template Parameters**

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

**Parameters**

<i>cap</i>	source capability (L4::Cap<T>)
<i>rights</i>	rights mask that shall be applied on transfer.

Definition at line 649 of file [ipc\\_types](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< DATA >::Driver\\_mem\\_region\\_t\(\)](#).

Here is the caller graph for this function:

#### 14.4.2.5 make\_cap\_full()

```

template<typename T >
Cap< T > L4::Ipc::make_cap_full (
    L4::Cap< T > cap ) [noexcept]
  
```

Make an L4::IPC::Cap<T> for the given capability with full fpage and object-specific rights.

##### Template Parameters

<i>T</i>	(implicit) type of the referenced interface
----------	---

##### Parameters

<i>cap</i>	source capability (L4::Cap<T>)
------------	--------------------------------

##### See also

[L4\\_cap\\_fpage\\_rights](#)

[L4\\_obj\\_fpage\\_ctl](#)

##### Note

Full rights (including object-specific rights) are required when mapping an IPC gate where the receiver should become the server, i.e. where the receiver wants to call [L4::lpc\\_gate::bind\\_thread\(\)](#).

Definition at line 687 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RWSD](#), and [L4\\_FPAGE\\_C\\_OBJ\\_RIGHTS](#).

#### 14.4.2.6 make\_cap\_rw()

```
template<typename T >  
Cap< T > L4::Ipc::make_cap_rw (   
    L4::Cap< T > cap ) [noexcept]
```

Make an L4::Ipc::Cap<T> for the given capability with [L4\\_CAP\\_FPAGE\\_RW](#) rights.

## Template Parameters

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

## Parameters

<i>cap</i>	source capability (L4::Cap<T>)
------------	--------------------------------

## Examples

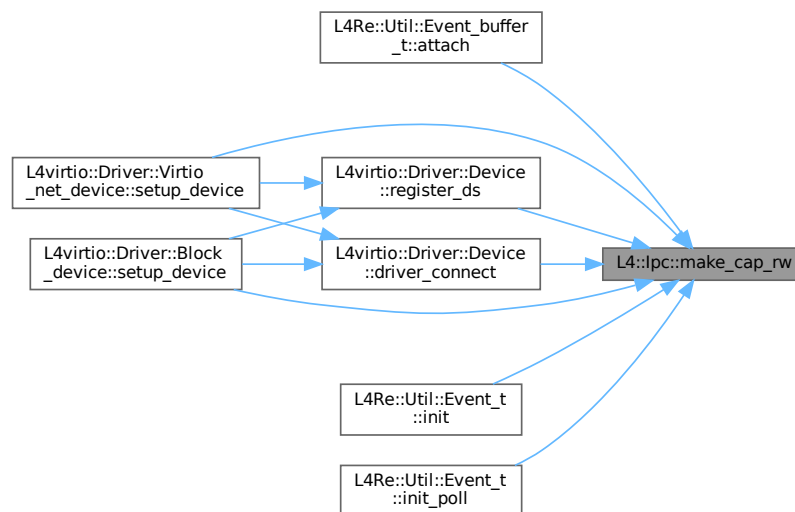

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared\\_](#)

Definition at line 659 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RW](#).

Referenced by [L4Re::Util::Event\\_buffer\\_t< PAYLOAD >::attach\(\)](#), [L4virtio::Driver::Device::driver\\_connect\(\)](#), [L4Re::Util::Event\\_t< PAYLOAD >::init\(\)](#), [L4Re::Util::Event\\_t< PAYLOAD >::init\\_poll\(\)](#), [L4virtio::Driver::Device::register\\_ds\(\)](#), [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#).

Here is the caller graph for this function:

## 14.4.2.7 make\_cap\_rws()

```

template<typename T >
Cap< T > L4::Ipc::make_cap_rws (
    L4::Cap< T > cap ) [noexcept]

```

Make an `L4::Ipc::Cap<T>` for the given capability with [L4\\_CAP\\_FPAGE\\_RWS](#) rights.

## Template Parameters

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

## Parameters

<i>cap</i>	source capability ( <code>L4::Cap&lt;T&gt;</code> )
------------	---

Definition at line 669 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RWS](#).

**14.4.2.8 msg\_ptr()**

```
template<typename T >
Msg_ptr< T > L4::Ipc::msg_ptr (
    T *& p )
```

Create an [Msg\\_ptr](#) to adjust the given pointer.

This function makes it more convenient to extract pointers to data in the message buffer itself from an [lpc::Istream](#). This may be used to avoid copy out of large data structures. (See [Msg\\_ptr](#).)

Definition at line 263 of file [ipc\\_stream](#).

**14.4.2.9 read()**

```
template<typename T >
T L4::Ipc::read (
    Istream & s ) [inline]
```

Read a value out of a stream.

## Parameters

<i>s</i>	An <a href="#">Istream</a> .
----------	------------------------------

## Returns

The value of type `T`.

The stream position is progressed accordingly.

Definition at line 1300 of file [ipc\\_stream](#).

**14.4.2.10 str\_cp\_in()**

```
template<typename T >
Str_cp_in< T > L4::Ipc::str_cp_in (
```

```

T * v,
unsigned long & size )

```

Create a [Str\\_cp\\_in](#) for the given values.

#### Parameters

	<i>v</i>	Pointer to the array that shall receive the values from the <a href="#">lpc::lstream</a> .
<i>in, out</i>	<i>size</i>	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

This function makes it more convenient to extract arrays from an [lpc::lstream](#) (

See also

[Str\\_cp\\_in](#).)

Definition at line 224 of file [ipc\\_stream](#).

## 14.5 L4::lpc::Msg Namespace Reference

IPC Message related functionality.

### Data Structures

- struct [Clnt\\_val\\_ops](#)  
*Defines client-side handling of 'MTYPE' as RPC argument.*
- struct [Cls\\_buffer](#)  
*Marker type for receive buffer values.*
- struct [Cls\\_data](#)  
*Marker type for data values.*
- struct [Cls\\_item](#)  
*Marker type for item values.*
- struct [Dir\\_in](#)  
*Marker type for input values.*
- struct [Dir\\_out](#)  
*Marker type for output values.*
- struct [Do\\_in\\_data](#)  
*Marker for Input data.*
- struct [Do\\_in\\_items](#)  
*Marker for Input items.*
- struct [Do\\_out\\_data](#)  
*Marker for Output data.*
- struct [Do\\_out\\_items](#)  
*Marker for Output items.*
- struct [Do\\_rcv\\_buffers](#)  
*Marker for receive buffers.*
- struct [Elem< Array< A, LEN > & >](#)  
*[Array](#) as output argument.*

- struct [Elem< Array< A, LEN > >](#)  
*Array as input arguments.*
- struct [Elem< Array\\_ref< A, LEN > & >](#)  
*Array\_ref as output argument.*
- struct [Is\\_valid\\_rpc\\_type](#)  
*Type trait defining a valid RPC parameter type.*
- struct [Svr\\_arg\\_pack](#)  
*Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function.*
- struct [Svr\\_val\\_ops](#)  
*Defines server-side handling for `MTYPE` server arguments.*

## Enumerations

- enum {  
[Word\\_bytes](#) = sizeof(l4\_umword\_t) , [Item\\_words](#) = 2 , [Item\\_bytes](#) = Word\_bytes \* Item\_words , [Mr\\_words](#) = L4\_UTCB\_GENERIC\_DATA\_SIZE ,  
[Mr\\_bytes](#) = Word\_bytes \* Mr\_words , [Br\\_bytes](#) = Word\_bytes \* L4\_UTCB\_GENERIC\_BUFFERS\_SIZE }

## Functions

- constexpr unsigned long [align\\_to](#) (unsigned long bytes, unsigned long align) noexcept  
*Pad bytes to the given alignment align (in bytes)*
- template<typename T >  
 constexpr unsigned long [align\\_to](#) (unsigned long bytes) noexcept  
*Pad bytes to the alignment of the type T.*
- template<typename T >  
 constexpr bool [check\\_size](#) (unsigned offset, unsigned limit) noexcept  
*Check if there is enough space for T from offset to limit.*
- template<typename T , typename CTYPE >  
 bool [check\\_size](#) (unsigned offset, unsigned limit, CTYPE cnt) noexcept  
*Check if there is enough space for an array of T from offset to limit.*
- template<typename T >  
 int [msg\\_add](#) (char \*msg, unsigned offs, unsigned limit, T v) noexcept  
*Add some data to a message at offs.*
- template<typename T >  
 int [msg\\_get](#) (char \*msg, unsigned offs, unsigned limit, T &v) noexcept  
*Get some data from a message at offs.*

### 14.5.1 Detailed Description

IPC Message related functionality.

### 14.5.2 Enumeration Type Documentation

#### 14.5.2.1 anonymous enum

anonymous enum

## Enumerator

Word_bytes	number of bytes for one message word
Item_words	number of message words for one message item
Item_bytes	number of bytes for one message item
Mr_words	number of message words available in the UTCB
Mr_bytes	number of bytes available in the UTCB message registers
Br_bytes	number of bytes available in the UTCB buffer registers

Definition at line 96 of file [ipc\\_basics](#).

### 14.5.3 Function Documentation

#### 14.5.3.1 align\_to() [1/2]

```
template<typename T >
constexpr unsigned long L4::Ipc::Msg::align_to (
    unsigned long bytes ) [constexpr], [noexcept]
```

Pad *bytes* to the alignment of the type *T*.

##### Template Parameters

<i>T</i>	The data type used for the alignment
----------	--------------------------------------

##### Parameters

<i>bytes</i>	The value to add the padding to
--------------	---------------------------------

##### Returns

*bytes* padded to achieve the alignment of *T*.

Definition at line 51 of file [ipc\\_basics](#).

References [align\\_to\(\)](#).

Here is the call graph for this function:

### 14.5.3.2 align\_to() [2/2]

```
constexpr unsigned long L4::Ipc::Msg::align_to (
    unsigned long bytes,
    unsigned long align ) [constexpr], [noexcept]
```

Pad bytes to the given alignment *align* (in bytes)

#### Parameters

<i>bytes</i>	The input value in bytes
<i>align</i>	The alignment value in bytes

#### Returns

the result after padding *bytes* to *align*.

Definition at line 41 of file [ipc\\_basics](#).

Referenced by [align\\_to\(\)](#).

Here is the caller graph for this function:

### 14.5.3.3 check\_size() [1/2]

```
template<typename T >
constexpr bool L4::Ipc::Msg::check_size (
    unsigned offset,
    unsigned limit ) [constexpr], [noexcept]
```

Check if there is enough space for T from offset to limit.

#### Template Parameters

<i>T</i>	The data type that shall be fitted at <i>offset</i>
----------	---

#### Parameters

<i>offset</i>	The current offset in bytes (must already be padded if desired).
<i>limit</i>	The limit in bytes that must not be exceeded after adding the size of <i>T</i> .

**Returns**

true if the limit will not be exceeded, false else.

Definition at line 64 of file [ipc\\_basics](#).

**14.5.3.4 check\_size()** [2/2]

```
template<typename T , typename CTYPE >
bool L4::IpC::Msg::check_size (
    unsigned offset,
    unsigned limit,
    CTYPE cnt ) [inline], [noexcept]
```

Check if there is enough space for an array of T from offset to limit.

**Template Parameters**

<i>T</i>	The data type that shall be fitted at <i>offset</i>
<i>CTYPE</i>	Type of the <i>cnt</i> parameter

**Parameters**

<i>offset</i>	The current offset in bytes (must already be padded if desired).
<i>limit</i>	The limit in bytes that must not be exceeded after adding <i>cnt</i> times the size of <i>T</i> .
<i>cnt</i>	The number of elements of type <i>T</i> that shall be put at <i>offset</i> .

**Returns**

true if the limit will not be exceeded, false else.

Definition at line 82 of file [ipc\\_basics](#).

References [L4\\_UNLIKELY](#).

**14.5.3.5 msg\_add()**

```
template<typename T >
int L4::IpC::Msg::msg_add (
    char * msg,
    unsigned offs,
    unsigned limit,
    T v ) [inline], [noexcept]
```

Add some data to a message at offs.

**Template Parameters**

<i>T</i>	The type of the data to add
----------	-----------------------------

## Parameters

<i>msg</i>	pointer to the start of the message
<i>offs</i>	The current offset within the message, this shall be padded to the alignment of <i>T</i> if <i>v</i> is added.
<i>limit</i>	The size limit in bytes that offset must not exceed.
<i>v</i>	The value to add to the message

## Returns

The new offset when successful, a negative value if the given limit will be exceeded.

Definition at line 125 of file [ipc\\_basics](#).

References [L4\\_MSGTOOLONG](#), and [L4\\_UNLIKELY](#).

### 14.5.3.6 msg\_get()

```
template<typename T >
int L4::Ipc::Msg::msg_get (
    char * msg,
    unsigned offs,
    unsigned limit,
    T & v ) [inline], [noexcept]
```

Get some data from a message at offs.

## Template Parameters

<i>T</i>	The type of the data to read
----------	------------------------------

## Parameters

<i>msg</i>	Pointer to the start of the message
<i>offs</i>	The current offset within the message, this shall be padded to the alignment of <i>T</i> if a <i>v</i> can be read.
<i>limit</i>	The size limit in bytes that offset must not exceed.
<i>v</i>	A reference to receive the value from the message

## Returns

The new offset when successful, a negative value if the given limit will be exceeded.

Definition at line 146 of file [ipc\\_basics](#).

References [L4\\_MSGTOOSHORT](#), and [L4\\_UNLIKELY](#).

## 14.6 L4::ipc\_svr Namespace Reference

Helper classes for [L4::Server](#) instantiation.

## Data Structures

- class [Br\\_manager\\_no\\_buffers](#)  
*Empty implementation of [Server\\_iface](#).*
- struct [Compound\\_reply](#)  
*Mix in for [LOOP\\_HOOKS](#) to always use compound reply and wait.*
- struct [Default\\_loop\\_hooks](#)  
*Default [LOOP\\_HOOKS](#).*
- struct [Default\\_setup\\_wait](#)  
*Mix in for [LOOP\\_HOOKS](#) for setup\_wait no op.*
- struct [Default\\_timeout](#)  
*Mix in for [LOOP\\_HOOKS](#) to use a 0 send and a infinite receive timeout.*
- struct [Direct\\_dispatch](#)  
*Direct dispatch helper, for forwarding dispatch calls to a registry *R*.*
- struct [Direct\\_dispatch< R \\* >](#)  
*Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry *R*.*
- struct [Exc\\_dispatch](#)  
*Dispatch helper wrapping try {} catch {} around the dispatch call.*
- struct [Ignore\\_errors](#)  
*Mix in for [LOOP\\_HOOKS](#) to ignore IPC errors.*
- class [Server\\_iface](#)  
*Interface for server-loop related functions.*
- class [Timeout](#)  
*Callback interface for [Timeout\\_queue](#).*
- class [Timeout\\_queue](#)  
*[Timeout](#) queue to be used in *l4re* server loop.*
- class [Timeout\\_queue\\_hooks](#)  
*Loop hooks mixin for integrating a timeout queue into the server loop.*

## Enumerations

- enum [Reply\\_mode](#) { [Reply\\_compound](#) , [Reply\\_separate](#) }  
*Reply mode for server loop.*

### 14.6.1 Detailed Description

Helper classes for [L4::Server](#) instantiation.

## 14.7 L4::Typeid Namespace Reference

Definition of interface data-type helpers.

## Data Structures

- struct [P\\_dispatch](#)  
*Use for protocol based dispatch stage.*
- struct [Raw\\_ipc](#)  
*RPCs list for passing raw incoming IPC to the server object.*
- struct [Rpc\\_nocode](#)  
*List of RPCs of an interface using a single operation without an opcode.*
- struct [Rpcs](#)  
*Standard list of RPCs of an interface.*
- struct [Rpcs\\_code](#)  
*List of RPCs of an interface using a special opcode type.*
- struct [Rpcs\\_sys](#)  
*List of RPCs typically used for kernel interfaces.*

### 14.7.1 Detailed Description

Definition of interface data-type helpers.

#### Note

These type helpers are intended for internal use, if you look for standard C++ type traits use the `<type_traits>` header for the standard C++ library or use `<l4/cxx/type_traits>`.

## 14.8 L4::Types Namespace Reference

[L4](#) basic type helpers for C++.

## Data Structures

- struct [Bool](#)  
*Boolean meta type.*
- struct [False](#)  
*False meta value.*
- class [Flags](#)  
*Template for defining typical [Flags](#) bitmaps.*
- struct [Flags\\_ops\\_t](#)  
*Mixin class to define a set of friend bitwise operators on *DT*.*
- struct [Flags\\_t](#)  
*Template type to define a flags type with bitwise operations.*
- struct [Int\\_for\\_size](#)  
*Metafunction to get an unsigned integral type for the given size.*
- struct [Int\\_for\\_type](#)  
*Metafunction to get an integral type of the same size as *T*.*
- struct [Same](#)  
*Compare two data types for equality.*
- struct [True](#)  
*True meta value.*

### 14.8.1 Detailed Description

[L4](#) basic type helpers for C++.

## 14.9 L4Re Namespace Reference

[L4Re](#) C++ Interfaces.

### Namespaces

- namespace [Util](#)  
*Documentation of the [L4](#) Runtime Environment utility functionality in C++.*
- namespace [Vfs](#)  
*Virtual file system for interfaces in POSIX libc.*

### Data Structures

- class [Cap\\_alloc](#)  
*Capability allocator interface.*
- class [Console](#)  
*[Console](#) class.*
- class [Dataspace](#)  
*Interface for memory-like objects.*
- class [Debug\\_obj](#)  
*Debug interface.*
- struct [Default\\_event\\_payload](#)  
*Default event stream payload.*
- class [Dma\\_space](#)  
*Managed DMA Address Space.*
- class [Env](#)  
*C++ interface of the initial environment that is provided to an [L4](#) task.*
- class [Event](#)  
*[Event](#) class.*
- class [Event\\_buffer\\_t](#)  
*[Event](#) buffer class.*
- class [Inhibitor](#)  
*Set of inhibitor locks, which inhibit specific actions when held.*
- class [Log](#)  
*[Log](#) interface class.*
- class [Mem\\_alloc](#)  
*Memory allocation interface.*
- struct [Mmio\\_space](#)  
*Interface for memory-like address space accessible via IPC.*
- class [Namespace](#)  
*Name-space interface.*
- class [Parent](#)  
*[Parent](#) interface.*
- struct [Random](#)

- *Low-bandwidth interface for random number generators.*
- class [Rm](#)  
*Region map.*
- class [Smart\\_cap\\_auto](#)  
*Helper for [Unique\\_cap](#) and [Unique\\_del\\_cap](#).*
- class [Smart\\_count\\_cap](#)  
*Helper for [Ref\\_cap](#) and [Ref\\_del\\_cap](#).*

## Typedefs

- `template<typename T >`  
using [Shared\\_cap](#) = [L4::Detail::Shared\\_cap\\_impl](#)< T, [Smart\\_count\\_cap](#)< [L4\\_FP\\_ALL\\_SPACES](#) > >  
*Shared capability that implements automatic free and unmap of the capability selector.*
- `template<typename T >`  
using [shared\\_cap](#) = [L4::Detail::Shared\\_cap\\_impl](#)< T, [Smart\\_count\\_cap](#)< [L4\\_FP\\_ALL\\_SPACES](#) > >

## 14.9.1 Detailed Description

[L4Re](#) C++ Interfaces.

[L4](#) Runtime Environment.

## 14.9.2 Typedef Documentation

### 14.9.2.1 Shared\_cap

```
template<typename T >
using L4Re::Shared\_cap = typedef L4::Detail::Shared_cap_impl<T, Smart\_count\_cap<L4\_FP\_ALL\_SPACES>
>
```

Shared capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Shared\\_cap](#).

Definition at line 44 of file [shared\\_cap](#).

### 14.9.2.2 shared\_cap

```
template<typename T >
using L4Re::shared\_cap = typedef L4::Detail::Shared_cap_impl<T, Smart\_count\_cap<L4\_FP\_ALL\_SPACES>
>
```

Shared capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Shared\\_cap](#).

Definition at line 47 of file [shared\\_cap](#).

### 14.9.2.3 Shared\_del\_cap

```
template<typename T >
using L4Re::Shared_del_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_DELETE_OBJ>
>
```

Shared capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to `Shared_cap` is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Shared\\_del\\_cap](#).

Definition at line 80 of file [shared\\_cap](#).

### 14.9.2.4 shared\_del\_cap

```
template<typename T >
using L4Re::shared_del_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_DELETE_OBJ>
>
```

Shared capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to `Shared_cap` is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use `L4Re::Util::Shared_del_cap`.

Definition at line 83 of file `shared_cap`.

### 14.9.2.5 Unique\_cap

```
template<typename T >
using L4Re::Unique_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_ALL_SPACES>
>
```

Unique capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use `L4Re::Util::Unique_cap`.

Definition at line 42 of file `unique_cap`.

### 14.9.2.6 unique\_cap

```
template<typename T >
using L4Re::unique_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_ALL_SPACES>
>
```

Unique capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use `L4Re::Util::Unique_cap`.

Definition at line 45 of file `unique_cap`.

### 14.9.2.7 Unique\_del\_cap

```
template<typename T >
using L4Re::Unique_del_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_DELETE_OBJ>
>
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to Unique\_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Unique\\_del\\_cap](#).

Definition at line 75 of file [unique\\_cap](#).

### 14.9.2.8 unique\_del\_cap

```
template<typename T >
using L4Re::unique_del_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_DELETE_OBJ>
>
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to Unique\_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Unique\\_del\\_cap](#).

Definition at line 78 of file [unique\\_cap](#).

## 14.9.3 Function Documentation

### 14.9.3.1 chkcap()

```
template<typename T >
T L4Re::chkcap (
    T && cap,
    char const * extra = "",
    long err = -L4_ENOMEM ) [inline]
```

Check for valid capability or raise C++ exception.

## Template Parameters

<i>T</i>	Type of object to check, must be capability-like ( <a href="#">L4::Cap</a> , <a href="#">L4Re::Util::Unique_cap</a> etc.)
----------	---

## Parameters

<i>cap</i>	Capability value to check.
<i>extra</i>	Optional text for exception.
<i>err</i>	Error value for exception or 0 if the capability value should be used.

This function checks whether the capability is valid. If the capability is invalid an C++ exception is generated, using *err* if *err* is not zero, otherwise the capability value is used. A valid capability will just be returned.

Definition at line 145 of file [error\\_helper](#).

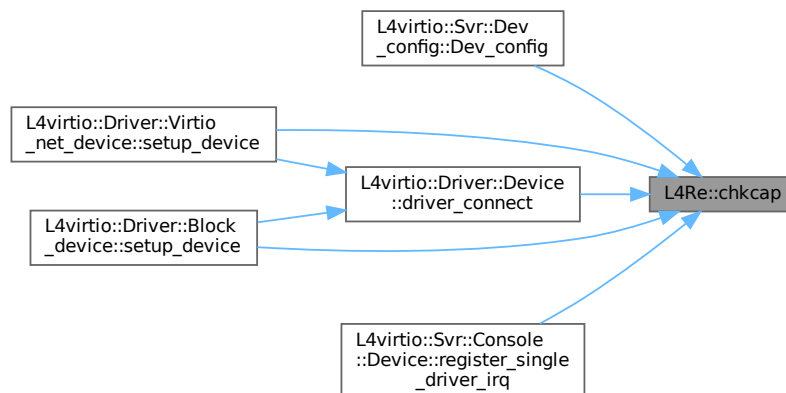

References [L4\\_UNLIKELY](#), and [throw\\_error\(\)](#).

Referenced by [L4virtio::Svr::Dev\\_config::Dev\\_config\(\)](#), [L4virtio::Driver::Device::driver\\_connect\(\)](#), [L4virtio::Svr::Console::Device::register\\_single\\_driver\\_irq\(\)](#), [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 14.9.3.2 chkipc()

```
l4_msgtag_t L4Re::chkipc (
    l4_msgtag_t tag,
    char const * extra = "",
    l4_utcb_t * utcb = l4_utcb() ) [inline]
```

Test a message tag for IPC errors.

#### Parameters

<i>tag</i>	Message tag returned by the IPC.
<i>extra</i>	Exception message in case of error.
<i>utcb</i>	The UTCB used in the IPC operation.

#### Returns

On IPC error an exception is thrown, otherwise `tag` is returned.

#### Exceptions

<i>L4::Runtime_exception</i>	with the translated IPC error code
------------------------------	------------------------------------

This function does not check the message tag's label value.

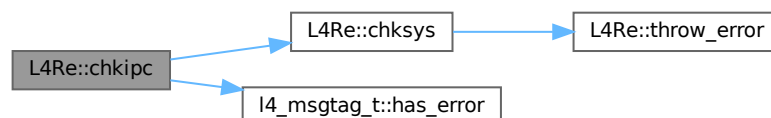

#### Note

This must be called on a message tag before the UTCB is changed.

Definition at line 176 of file [error\\_helper](#).

References [chksys\(\)](#), [l4\\_msgtag\\_t::has\\_error\(\)](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

### 14.9.3.3 chksys() [1/3]

```
long L4Re::chksys (
    l4_msgtag_t const & t,
    char const * extra = "",
    l4_utcb_t * utcb = l4_utcb(),
    long ret = 0 ) [inline]
```

Generate C++ exception on error.

## Parameters

<i>t</i>	Message tag.
<i>extra</i>	Optional text for exception (default "")
<i>utcb</i>	Option UTCB
<i>ret</i>	Optional value for exception, default is error value (err)

This function throws an exception if the message tag contains an error or the label in the message tag is negative. Otherwise the label in the message tag is returned.

Definition at line 89 of file [error\\_helper](#).

References [l4\\_msgtag\\_t::has\\_error\(\)](#), [L4\\_UNLIKELY](#), [l4\\_msgtag\\_t::label\(\)](#), and [throw\\_error\(\)](#).

Here is the call graph for this function:

#### 14.9.3.4 chksys() [2/3]

```

long L4Re::chksys (
    l4_msgtag_t const & t,
    l4_utcb_t * utcb,
    char const * extra = "" ) [inline]

```

Generate C++ exception on error.

## Parameters

<i>t</i>	Message tag.
<i>utcb</i>	UTCB.
<i>extra</i>	Optional text for exception (default "")

This function throws an exception if the message tag contains an error or the label in the message tag is negative. Otherwise the label in the message tag is returned.

Definition at line 112 of file [error\\_helper](#).

References [chksys\(\)](#).

Here is the call graph for this function:

### 14.9.3.5 chksys() [3/3]

```

long L4Re::chksys (
    long err,
    char const * extra = "",
    long ret = 0 ) [inline]
  
```

Generate C++ exception on error.

#### Parameters

<i>err</i>	Error value, if negative exception will be thrown
<i>extra</i>	Optional text for exception (default "")
<i>ret</i>	Optional value for exception, default is error value (err)

This function throws an exception if the *err* is negative and otherwise returns *err*.

#### Examples

#### 14.9.3.6 make\_shared\_cap()

```

template<typename T >
Shared_cap< T > L4Re::make_shared_cap (
    L4Re::Cap_alloc * ca )

```

Allocate a capability slot and wrap it in a `Shared_cap`.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

## Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

## Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_shared\\_cap<T>\(\)](#).

Definition at line 60 of file [shared\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

## 14.9.3.7 make\_shared\_del\_cap()

```

template<typename T >
Shared_del_cap< T > L4Re::make_shared_del_cap (
    L4Re::Cap_alloc * ca )
  
```

Allocate a capability slot and wrap it in a Shared\_del\_cap.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

## Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

## Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_shared\\_del\\_cap<T>\(\)](#).

Definition at line 96 of file [shared\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

#### 14.9.3.8 make\_unique\_cap()

```

template<typename T >
Unique_cap< T > L4Re::make_unique_cap (
    L4Re::Cap_alloc * ca )
  
```

Allocate a capability slot and wrap it in an Unique\_cap.

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

##### Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

##### Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_unique\\_cap<T>\(\)](#).

Definition at line 58 of file [unique\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

### 14.9.3.9 make\_unique\_del\_cap()

```
template<typename T >
Unique_del_cap< T > L4Re::make_unique_del_cap (
    L4Re::Cap_alloc * ca )
```

Allocate a capability slot and wrap it in an Unique\_del\_cap.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

#### Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

#### Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_unique\\_del\\_cap<T>\(\)](#).

Definition at line 91 of file [unique\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

### 14.9.3.10 throw\_error()

```
void L4Re::throw_error (
    long err,
    char const * extra = "" ) [inline]
```

Generate C++ exception.

#### Parameters

<i>err</i>	Error value
<i>extra</i>	Optional text for exception (default "")

This function throws an [L4](#) exception. The exact exception type depends on the error value (err). This function does

never return.

### Examples

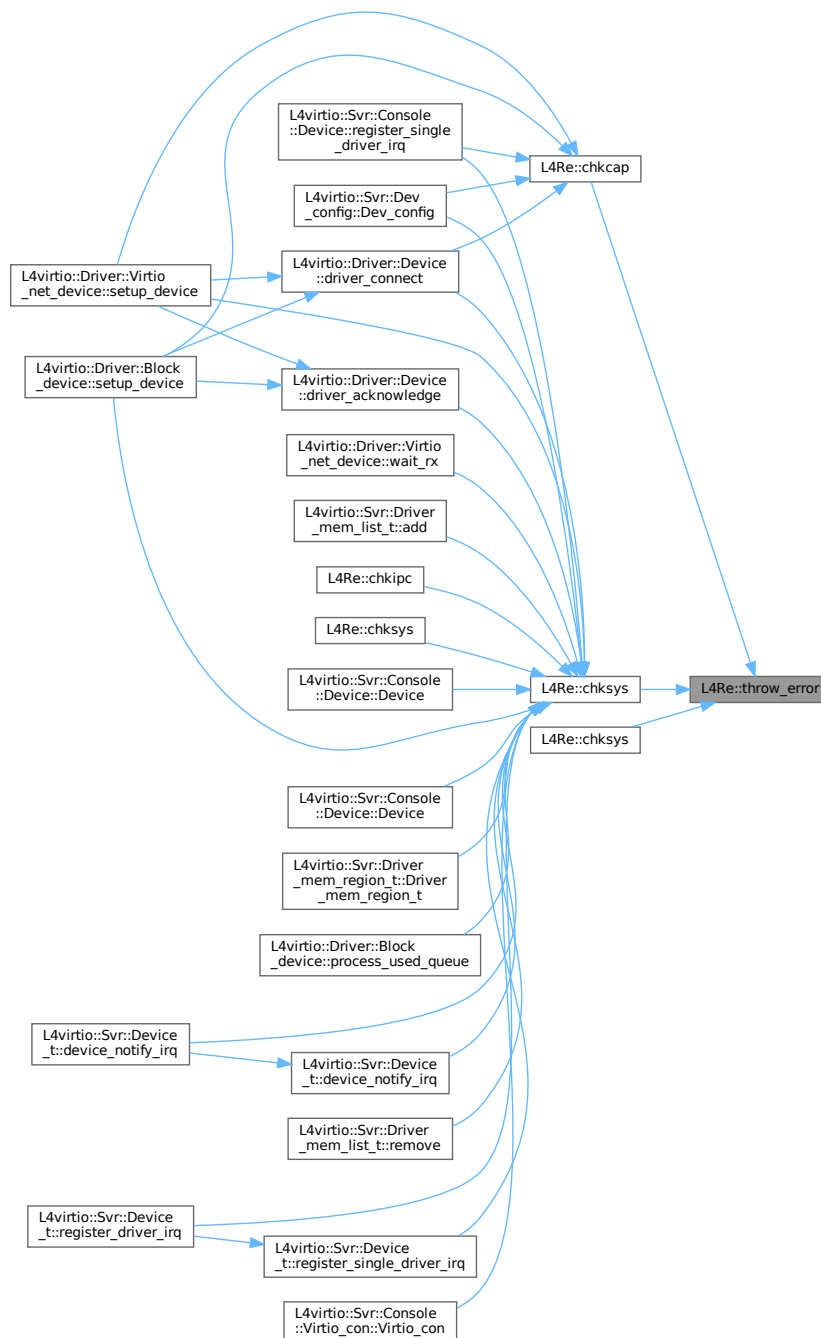

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#).

### 14.10.1 Detailed Description

Documentation of the [L4](#) Runtime Environment utility functionality in C++.

### 14.10.2 Typedef Documentation

#### 14.10.2.1 Shared\_cap

```
template<typename T >
using L4Re::Util::Shared_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_ALL_SPACES>
>
```

Shared capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

Usage:

```
L4Re::Util::Shared_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_cap<L4Re::Dataspace>
        ds_cap = make_shared_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 59 of file [shared\\_cap](#).

#### 14.10.2.2 shared\_cap

```
template<typename T >
using L4Re::Util::shared_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_ALL_SPACES>
>
```

Shared capability that implements automatic free and unmap of the capability selector.

**Template Parameters**

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

**Usage:**

```
L4Re::Util::Shared_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_cap<L4Re::Dataspace>
        ds_cap = make_shared_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 62 of file [shared\\_cap](#).

**14.10.2.3 Shared\_del\_cap**

```
template<typename T >
using L4Re::Util::Shared_del_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_DELETE_OBJ>
>
```

Shared capability that implements automatic free and unmap+delete of the capability selector.

**Template Parameters**

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to `Shared_cap` is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

**Usage:**

```
L4Re::Util::Shared_del_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_del_cap<L4Re::Dataspace>
        ds_cap = make_shared_del_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));
}
```

```

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).

```

Definition at line 109 of file [shared\\_cap](#).

#### 14.10.2.4 shared\_del\_cap

```

template<typename T >
using L4Re::Util::shared_del_cap = typedef L4::Detail::Shared_cap_impl<T, Smart_count_cap<L4_FP_DELETE_OBJ>
>

```

Shared capability that implements automatic free and unmap+delete of the capability selector.

##### Template Parameters

<b>T</b>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to Shared\_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

##### Usage:

```

L4Re::Util::Shared_del_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_del_cap<L4Re::Dataspace>
        ds_cap = make_shared_del_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).

```

Definition at line 112 of file [shared\\_cap](#).

#### 14.10.2.5 Unique\_cap

```

template<typename T >
using L4Re::Util::Unique_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_ALL_SPACES>
>

```

Unique capability that implements automatic free and unmap of the capability selector.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

## Usage:

```
{
    L4Re::Util::Unique_cap<L4Re::Dataspace>
        ds_cap = L4Re::Util::make_unique_cap<L4Re::Dataspace>();

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

    ...

    // At the end of the scope ds_cap is unmapped and the capability
    // selector is freed.
}
```

Definition at line 54 of file [unique\\_cap](#).

## 14.10.2.6 unique\_cap

```
template<typename T >
using L4Re::Util::unique_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_ALL_SPACES>
>
```

Unique capability that implements automatic free and unmap of the capability selector.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

## Usage:

```
{
    L4Re::Util::Unique_cap<L4Re::Dataspace>
        ds_cap = L4Re::Util::make_unique_cap<L4Re::Dataspace>();

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

    ...

    // At the end of the scope ds_cap is unmapped and the capability
    // selector is freed.
}
```

Definition at line 57 of file [unique\\_cap](#).

### 14.10.2.7 Unique\_del\_cap

```
template<typename T >
using L4Re::Util::Unique_del_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_DELETE_OBJ>
>
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to Unique\_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Usage:

```
{
    L4Re::Util::Unique_del_cap<L4Re::Dataspace>
        ds_cap = make_unique_del_cap<L4Re::Dataspace>();

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

    ...

    // At the end of the scope ds_cap is unmapped and the capability
    // selector is freed. Because the deletion flag is set the data space
    // shall also be deleted (even if there are other references to this
    // data space).
}
```

Definition at line 97 of file [unique\\_cap](#).

### 14.10.2.8 unique\_del\_cap

```
template<typename T >
using L4Re::Util::unique_del_cap = typedef L4::Detail::Unique_cap_impl<T, Smart_cap_auto<L4_FP_DELETE_OBJ>
>
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to Unique\_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Usage:

```
{
    L4Re::Util::Unique_del_cap<L4Re::Dataspace>
```

```

    ds_cap = make_unique_del_cap<L4Re::Dataspace>());

// use the dataspace cap
L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

...

// At the end of the scope ds_cap is unmapped and the capability
// selector is freed. Because the deletion flag is set the data space
// shall also be deleted (even if there are other references to this
// data space).
}

```

Definition at line 100 of file [unique\\_cap](#).

### 14.10.3 Function Documentation

#### 14.10.3.1 make\_shared\_cap()

```

template<typename T >
Shared_cap< T > L4Re::Util::make_shared_cap ( )

```

Allocate a capability slot and wrap it in a Shared\_cap.

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 71 of file [shared\\_cap](#).

References [cap\\_alloc](#).

#### 14.10.3.2 make\_shared\_del\_cap()

```

template<typename T >
Shared_del_cap< T > L4Re::Util::make_shared_del_cap ( )

```

Allocate a capability slot and wrap it in a Shared\_del\_cap.

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 121 of file [shared\\_cap](#).

References [cap\\_alloc](#).

#### 14.10.3.3 make\_unique\_cap()

```

template<typename T >
Unique_cap< T > L4Re::Util::make_unique_cap ( )

```

Allocate a capability slot and wrap it in an Unique\_cap.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 66 of file [unique\\_cap](#).

References [cap\\_alloc](#).

#### 14.10.3.4 make\_unique\_del\_cap()

```
template<typename T >
Unique_del_cap< T > L4Re::Util::make_unique_del_cap ( )
```

Allocate a capability slot and wrap it in an Unique\_del\_cap.

## Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 109 of file [unique\\_cap](#).

*Power-management API mixin.*
- class [Vbus](#)  
*The virtual bus ([Vbus](#)) interface.*

### 14.12.1 Detailed Description

C++ interface of the [Vbus](#) API.

The virtual bus ([Vbus](#)) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an [Icu](#) ([Interrupt controller](#)) for interrupt handling.

The [Vbus](#) interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

Refer to [L4 Vbus functions](#) for the C API.

#### Include File

```
#include <l4/vbus/vbus>

Partial interface for devices that offer discard functionality.

```
#include <device.h>
```

Collaboration diagram for Block\_device::Device\_discard\_feature:

#### Public Member Functions

- virtual int **discard** ([l4\\_uint64\\_t](#) offset, [Block\\_device::Inout\\_block](#) const &blocks, [Block\\_device::Inout\\_callback](#) const &cb, bool discard)=0  
*Issues one or more WRITE\_ZEROES or DISCARD commands.*

#### 15.1.1 Detailed Description

Partial interface for devices that offer discard functionality.

Definition at line [120](#) of file [device.h](#).

The documentation for this struct was generated from the following file:

- [l4/libblock-device/device.h](#)

## 15.2 Block\_device::Device\_mgr< DEV, FACTORY, SCHEDULER > Class Template Reference

Basic class that scans devices and handles client connections.

```
#include <block_device_mgr.h>
```

Collaboration diagram for Block\_device::Device\_mgr< DEV, FACTORY, SCHEDULER >:

Block_device::Device_mgr< DEV, FACTORY, SCHEDULER >	
+	check_clients()
+	shutdown_event()

### Public Member Functions

- void **check\_clients** ()  
*Remove clients where the client IPC gate is no longer valid.*
- void **shutdown\_event** (Shutdown\_type type)  
*Process a shutdown event on all connections.*

### 15.2.1 Detailed Description

```
template<typename DEV, typename FACTORY = Simple_factory<DEV>, typename SCHEDULER = Rr_scheduler<typename FACTORY::Device_type>>
class Block_device::Device_mgr< DEV, FACTORY, SCHEDULER >
```

Basic class that scans devices and handles client connections.

#### Template Parameters

<i>DEV</i>	Base class for all devices.
<i>FACTORY</i>	Class that creates clients and partitions. See Simple_factory for an example of the required interface.
<i>SCHEDULER</i>	Class that schedules VIRTIO block requests from all clients.

Definition at line 80 of file [block\\_device\\_mgr.h](#).

The documentation for this class was generated from the following file:

- I4/libblock-device/block\_device\_mgr.h

## 15.3 Block\_device::Device\_with\_notification\_domain< DEV > Struct Template Reference

Device with a per-device notification domain.

```
#include <device.h>
```

Inherits DEV.

Collaboration diagram for Block\_device::Device\_with\_notification\_domain< DEV >:

### 15.3.1 Detailed Description

```
template<typename DEV>
struct Block_device::Device_with_notification_domain< DEV >
```

Device with a per-device notification domain.

Definition at line 110 of file [device.h](#).

The documentation for this struct was generated from the following file:

- `I4/libblock-device/device.h`

## 15.4 Block\_device::Dma\_region\_info Struct Reference

Base class used by the driver implementation to derive its own DMA mapping tracking structure.

```
#include <types.h>
```

Collaboration diagram for Block\_device::Dma\_region\_info:

### 15.4.1 Detailed Description

Base class used by the driver implementation to derive its own DMA mapping tracking structure.

Definition at line 44 of file [types.h](#).

The documentation for this struct was generated from the following file:

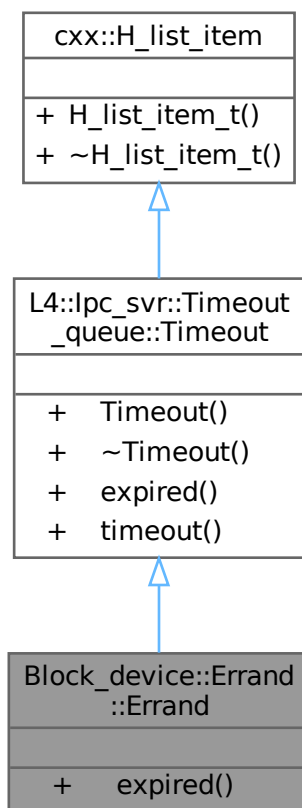

- l4/libblock-device/types.h

## 15.5 Block\_device::Errand::Errand Class Reference

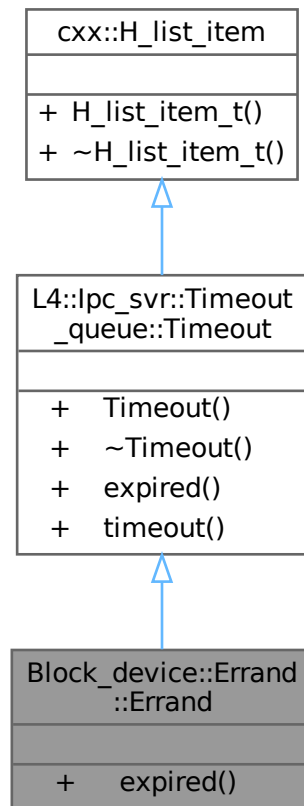

Wrapper for a small task executed asynchronously in the server loop.

```
#include <errand.h>
```

Inheritance diagram for Block\_device::Errand::Errand:

Collaboration diagram for `Block_device::Errand::Errand`:

### Public Member Functions

- void `expired()` final  
*callback function to be called when timeout happened*

### Public Member Functions inherited from `L4::lpc_svr::Timeout`

- `Timeout()`  
*Make a timeout.*
- virtual `~Timeout()`=0  
*Destroy a timeout.*
- `l4_kernel_clock_t timeout()` const  
*return absolute timeout of this callback.*

### Public Member Functions inherited from `cxx::H_list_item_t< ELEM_TYPE >`

- `H_list_item_t()`  
*Constructor.*
- `~H_list_item_t()` noexcept  
*Destructor.*

### 15.5.1 Detailed Description

Wrapper for a small task executed asynchronously in the server loop.

Errands are implemented as timeout tasks. They might be queued with the current timestamp, so that they are executed as soon as possible on the next iteration of the server loop or they might be scheduled with a timeout, which is particularly useful if the driver has to do a busy wait on the hardware.

Definition at line 108 of file [errand.h](#).

### 15.5.2 Member Function Documentation

#### 15.5.2.1 expired()

```
void Block_device::Errand::Errand::expired ( ) [inline], [final], [virtual]
```

callback function to be called when timeout happened

##### Note

The timeout object is already dequeued when this function is called, this means the timeout may be safely queued again within the [expired\(\)](#) function.

Implements [L4::lpc\\_svr::Timeout](#).

Definition at line 113 of file [errand.h](#).

References [L4::Runtime\\_error::str\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

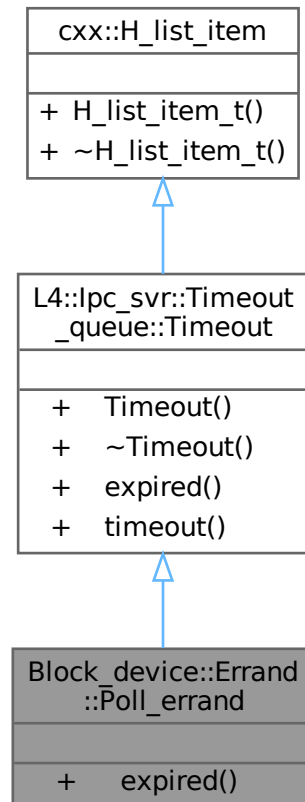

- `I4/libblock-device/errand.h`

## 15.6 Block\_device::Errand::Poll\_errand Class Reference

Wrapper for a regularly repeated task.

```
#include <errand.h>
```

Inheritance diagram for Block\_device::Errand::Poll\_errand:

Collaboration diagram for Block\_device::Errand::Poll\_errand:

### Public Member Functions

- void `expired()` final  
*callback function to be called when timeout happened*

### Public Member Functions inherited from `L4::lpc_svr::Timeout`

- `Timeout()`  
*Make a timeout.*
- virtual `~Timeout()`=0  
*Destroy a timeout.*
- `l4_kernel_clock_t timeout()` const  
*return absolute timeout of this callback.*

### Public Member Functions inherited from `cxx::H_list_item_t< ELEM_TYPE >`

- `H_list_item_t()`  
*Constructor.*
- `~H_list_item_t()` noexcept  
*Destructor.*

### 15.6.1 Detailed Description

Wrapper for a regularly repeated task.

Definition at line 42 of file [errand.h](#).

### 15.6.2 Member Function Documentation

#### 15.6.2.1 `expired()`

```
void Block_device::Errand::Poll_errand::expired ( ) [inline], [final], [virtual]
```

callback function to be called when timeout happened

##### Note

The timeout object is already dequeued when this function is called, this means the timeout may be safely queued again within the `expired()` function.

Implements [L4::lpc\\_svr::Timeout](#).

Definition at line 47 of file [errand.h](#).

References [L4::Runtime\\_error::str\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

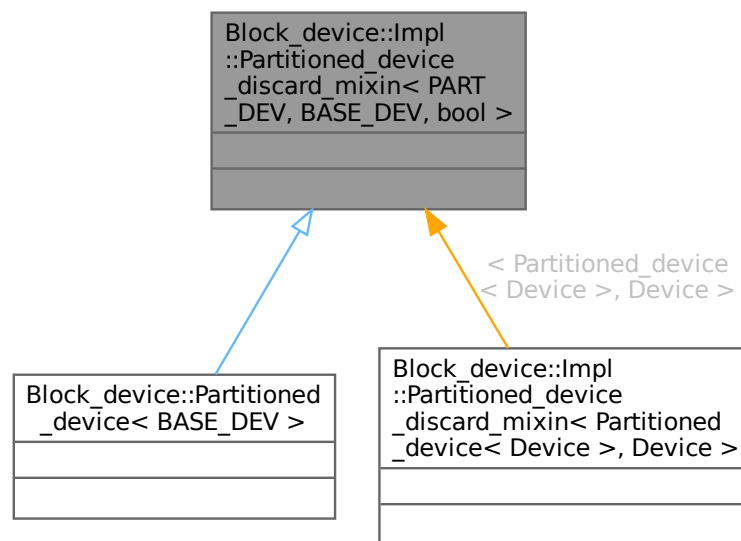

- `I4/libblock-device/errand.h`

## 15.7 Block\_device::Impl::Partitioned\_device\_discard\_mixin< PART\_DEV, BASE\_DEV, bool > Class Template Reference

Dummy class used when the device class is not derived from [Device\\_discard\\_feature](#).

```
#include <part_device.h>
```

Inheritance diagram for Block\_device::Impl::Partitioned\_device\_discard\_mixin< PART\_DEV, BASE\_DEV, bool >:

Collaboration diagram for Block\_device::Impl::Partitioned\_device\_discard\_mixin< PART\_DEV, BASE\_DEV, bool >:

### 15.7.1 Detailed Description

```
template<typename PART_DEV, typename BASE_DEV, bool = std::is_base_of<Device_discard_feature,
BASE_DEV>::value>
class Block_device::Impl::Partitioned_device_discard_mixin< PART_DEV, BASE_DEV, bool >
```

Dummy class used when the device class is not derived from [Device\\_discard\\_feature](#).

Definition at line 29 of file [part\\_device.h](#).

The documentation for this class was generated from the following file:

- I4/libblock-device/part\_device.h

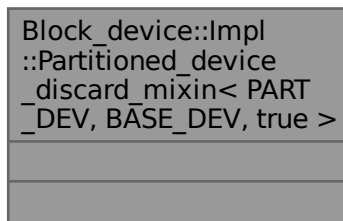

## 15.8 Block\_device::Impl::Partitioned\_device\_discard\_mixin< PART\_DEV, BASE\_DEV, true > Class Template Reference

Mixin implementing discard for partition devices.

```
#include <part_device.h>
```

Inherits [BASE\\_DEV](#).

Collaboration diagram for [Block\\_device::Impl::Partitioned\\_device\\_discard\\_mixin< PART\\_DEV, BASE\\_DEV, true >](#):

### 15.8.1 Detailed Description

```
template<typename PART_DEV, typename BASE_DEV>
class Block_device::Impl::Partitioned_device_discard_mixin< PART_DEV, BASE_DEV, true >
```

Mixin implementing discard for partition devices.

## Template Parameters

<i>PART_DEV</i>	Class of the partition device
<i>BASE_DEV</i>	Class implementing the Device interface.

Definition at line 38 of file [part\\_device.h](#).

The documentation for this class was generated from the following file:

- l4/libblock-device/part\_device.h

## 15.9 Block\_device::Inout\_block Struct Reference

Description of an inout block to be sent to the device.

```
#include <types.h>
```

Collaboration diagram for Block\_device::Inout\_block:

### Data Fields

- [l4\\_uint64\\_t](#) **sector** = 0  
*Initial sector. Used only by DISCARD / WRITE\_ZEROES requests.*
- [l4\\_uint32\\_t](#) **flags** = 0  
*Flags from Inout\_flags.*

### 15.9.1 Detailed Description

Description of an inout block to be sent to the device.

Block may be scatter gather in which case they are chained via the next pointer.

Definition at line 67 of file [types.h](#).

The documentation for this struct was generated from the following file:

- l4/libblock-device/types.h

## 15.10 Block\_device::Inout\_memory< DEV > Class Template Reference

Helper class that temporarily allocates memory that can be used for in/out operations with the device.

```
#include <inout_memory.h>
```

Inheritance diagram for Block\_device::Inout\_memory< DEV >:

Collaboration diagram for Block\_device::Inout\_memory< DEV >:

### 15.10.1 Detailed Description

```
template<typename DEV>
class Block_device::Inout_memory< DEV >
```

Helper class that temporarily allocates memory that can be used for in/out operations with the device.

Definition at line 26 of file [inout\\_memory.h](#).

The documentation for this class was generated from the following file:

- `I4/libblock-device/inout_memory.h`

## 15.11 Block\_device::Mem\_region\_info Struct Reference

Additional info stored in each [L4virtio::Svr::Driver\\_mem\\_region\\_t](#) used for tracking dataspace-wide DMA mappings.

```
#include <types.h>
```

Collaboration diagram for Block\_device::Mem\_region\_info:

### 15.11.1 Detailed Description

Additional info stored in each [L4virtio::Svr::Driver\\_mem\\_region\\_t](#) used for tracking dataspace-wide DMA mappings.

Definition at line 53 of file [types.h](#).

The documentation for this struct was generated from the following file:

- `l4/libblock-device/types.h`

## 15.12 Block\_device::Notification\_domain Struct Reference

Opaque type for representing a notification domain.

```
#include <device.h>
```

Collaboration diagram for Block\_device::Notification\_domain:

### 15.12.1 Detailed Description

Opaque type for representing a notification domain.

Notification domains must be assigned to devices such that all devices that require a shared pool of resources to process their requests, also find themselves in the same notification domain. In particular, if two devices access common resources, then they must be in the same domain. An example of this are two partitions sharing the same parent device because processing of requests for one partition might depend on completion of request processing in another partition. On the other hand, independent disk devices will typically not share the same notification domain because their requests are completely independent of each other.

Definition at line 33 of file [device.h](#).

The documentation for this struct was generated from the following file:

- [l4/libblock-device/device.h](#)

## 15.13 Block\_device::Partition\_info Struct Reference

Information about a single partition.

```
#include <partition.h>
```

Collaboration diagram for Block\_device::Partition\_info:

Block_device::Partition_info	
+	guid
+	name
+	first
+	last
+	flags

### Data Fields

- char **guid** [37]  
*ID of the partition.*
- std::u16string **name**  
*UTF16 name of the partition.*
- [l4\\_uint64\\_t](#) **first**  
*First valid sector.*
- [l4\\_uint64\\_t](#) **last**  
*Last valid sector.*
- [l4\\_uint64\\_t](#) **flags**  
*Additional flags, depending on partition type.*

### 15.13.1 Detailed Description

Information about a single partition.

Definition at line 30 of file [partition.h](#).

The documentation for this struct was generated from the following file:

- I4/libblock-device/partition.h

## 15.14 Block\_device::Partition\_reader< DEV > Class Template Reference

Partition table reader for block devices.

```
#include <partition.h>
```

Inherits `cxx::Ref_obj`.

Collaboration diagram for Block\_device::Partition\_reader< DEV >:

### 15.14.1 Detailed Description

```
template<typename DEV>  
class Block_device::Partition_reader< DEV >
```

Partition table reader for block devices.

Definition at line 44 of file [partition.h](#).

The documentation for this class was generated from the following file:

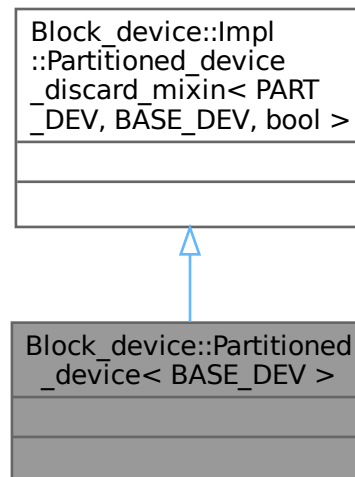

- I4/libblock-device/partition.h

## 15.15 Block\_device::Partitioned\_device< BASE\_DEV > Class Template Reference

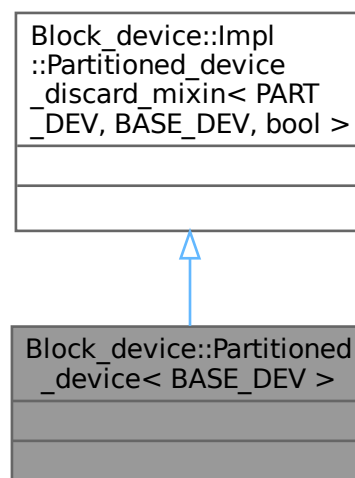

A partition device for the given device interface.

```
#include <part_device.h>
```

Inheritance diagram for Block\_device::Partitioned\_device< BASE\_DEV >:

Collaboration diagram for Block\_device::Partitioned\_device< BASE\_DEV >:

### 15.15.1 Detailed Description

```
template<typename BASE_DEV = Device>
class Block_device::Partitioned_device< BASE_DEV >
```

A partition device for the given device interface.

#### Template Parameters

<i>BASE_DEV</i>	Class defining the device interface. Attention: this is not the class implementing the device itself.
-----------------	---

Definition at line 92 of file [part\\_device.h](#).

The documentation for this class was generated from the following file:

- `l4/libblock-device/part_device.h`

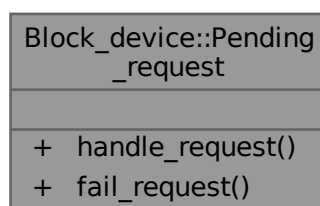

## 15.16 Block\_device::Pending\_request Struct Reference

Interface for pending requests.

```
#include <request.h>
```

Inherited by `Block_device::Virtio_client< DEV >::Generic_pending_request`.

Collaboration diagram for `Block_device::Pending_request`:

#### Public Member Functions

- virtual int [handle\\_request](#) ()=0  
*Callback used when the request is ready for processing.*
- virtual void [fail\\_request](#) ()=0  
*Callback used when a request is dropped from the queue.*

### 15.16.1 Detailed Description

Interface for pending requests.

Definition at line 15 of file [request.h](#).

### 15.16.2 Member Function Documentation

#### 15.16.2.1 fail\_request()

```
virtual void Block_device::Pending_request::fail_request ( ) [pure virtual]
```

Callback used when a request is dropped from the queue.

The function is called for notification only. The request will be destroyed.

#### 15.16.2.2 handle\_request()

```
virtual int Block_device::Pending_request::handle_request ( ) [pure virtual]
```

Callback used when the request is ready for processing.

Return values

<i>L4_EOK</i>	Request successfully issued. The callee has taken ownership of the request.
<i>-L4_EBUSY</i>	Device is still busy. The callee must not requeue the request as it will remain in the queue.
<	0 Other fatal error. The caller may dispose of the request.

The documentation for this struct was generated from the following file:

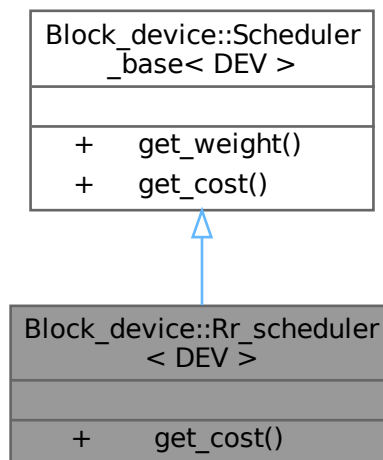

- [l4/libblock-device/request.h](#)

## 15.17 Block\_device::Rr\_scheduler< DEV > Struct Template Reference

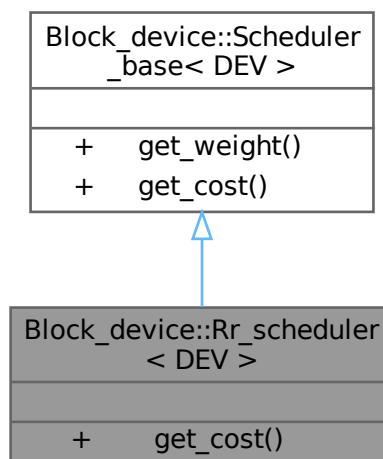

Round Robin scheduler class.

```
#include <scheduler.h>
```

Inheritance diagram for Block\_device::Rr\_scheduler< DEV >:

Collaboration diagram for Block\_device::Rr\_scheduler< DEV >:

### Public Member Functions

- `l4_size_t get_cost (Pending_request const &)` override  
*Return the cost of the pending request.*

## Public Member Functions inherited from [Block\\_device::Scheduler\\_base< DEV >](#)

- virtual [l4\\_size\\_t](#) **get\_weight** (Client\_type const \*)=0  
*Return the weight of the client.*

### 15.17.1 Detailed Description

```
template<typename DEV>
struct Block_device::Rr_scheduler< DEV >
```

Round Robin scheduler class.

All clients have fixed weight of 1 and all requests have fixed cost of 1, giving thus each client one scheduling chance per scheduling round.

Definition at line 340 of file [scheduler.h](#).

The documentation for this struct was generated from the following file:

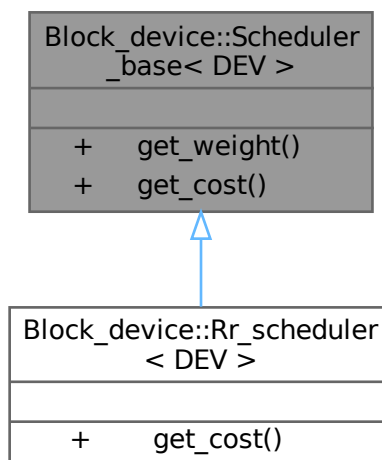

- [l4/libblock-device/scheduler.h](#)

## 15.18 [Block\\_device::Scheduler\\_base< DEV >](#) Class Template Reference

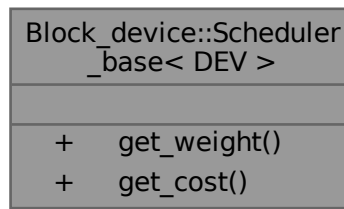

Scheduler base class.

```
#include <scheduler.h>
```

Inheritance diagram for [Block\\_device::Scheduler\\_base< DEV >](#):

Collaboration diagram for Block\_device::Scheduler\_base< DEV >:

### Public Member Functions

- virtual [l4\\_size\\_t](#) **get\_weight** (Client\_type const \*)=0  
*Return the weight of the client.*
- virtual [l4\\_size\\_t](#) **get\_cost** ([Pending\\_request](#) const &)=0  
*Return the cost of the pending request.*

### 15.18.1 Detailed Description

```
template<typename DEV>
class Block_device::Scheduler_base< DEV >
```

Scheduler base class.

Derive from this class and override [get\\_weight\(\)](#) and [get\\_cost\(\)](#) to implement the desired scheduling algorithm.

The interpretation of the weight function depends on the definition of the cost function. For example, if the cost of each request is fixed to be 1, the weight then says how many requests per scheduling round the client can process. If the weight of each client is also fixed to be 1, it will result in the Round Robin scheduler. If the request cost derives from the size of data the request operates on, the weight determines a data limit.

Definition at line [35](#) of file [scheduler.h](#).

The documentation for this class was generated from the following file:

- [l4/libblock-device/scheduler.h](#)

## 15.19 cxx::Avl\_map< KEY\_TYPE, DATA\_TYPE, COMPARE, ALLOC > Class Template Reference

AVL tree based associative container.

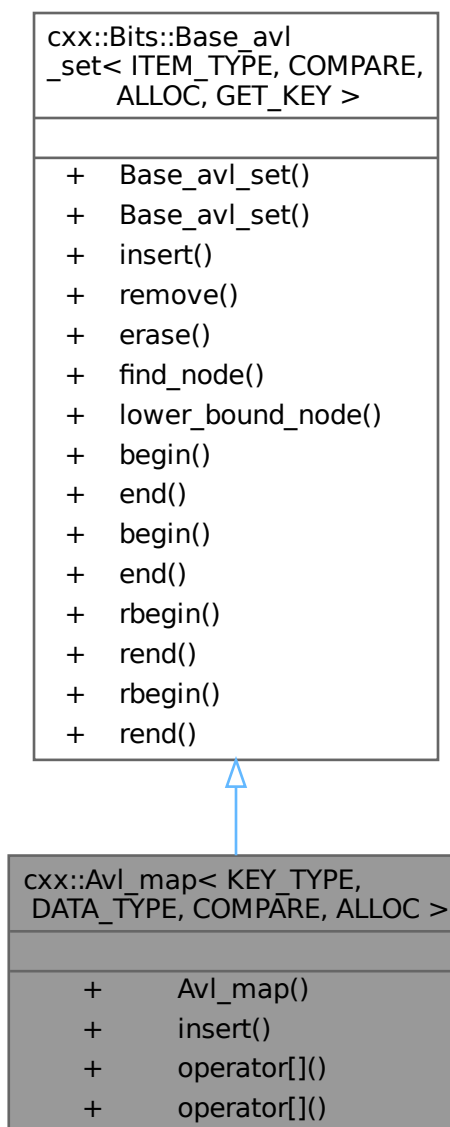

```
#include <avl_map>
```

Inheritance diagram for cxx::Avl\_map< KEY\_TYPE, DATA\_TYPE, COMPARE, ALLOC >:

Collaboration diagram for `cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >`:

## Public Types

### 15.19.1 Detailed Description

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↔
functor, template< typename B > class ALLOC = New_allocator>
class cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >
```

AVL tree based associative container.

#### Template Parameters

<i>KEY_TYPE</i>	Type of the key values.
<i>DATA_TYPE</i>	Type of the data values.
<i>COMPARE</i>	Type comparison functor for the key values.
<i>ALLOC</i>	Type of the allocator used for the nodes.

Definition at line 56 of file [avl\\_map](#).

### 15.19.2 Constructor & Destructor Documentation

#### 15.19.2.1 Avl\_map()

```
template<typename KEY_TYPE , typename DATA_TYPE , template< typename A > class COMPARE = Lt_↔
_functor, template< typename B > class ALLOC = New_allocator>
cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::Avl_map (
    Node\_allocator const & alloc = Node\_allocator() ) [inline]
```

Create an empty AVL-tree based map.

## Parameters

<i>alloc</i>	The node allocator.
--------------	---------------------

Definition at line 91 of file [avl\\_map](#).

## 15.19.3 Member Function Documentation

### 15.19.3.1 insert()

```
template<typename KEY_TYPE , typename DATA_TYPE , template< typename A > class COMPARE = Lt↔
_func, template< typename B > class ALLOC = New_allocator>
cxx::Pair< Iterator, int > cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::insert (
    Key_type const & key,
    Data_type const & data ) [inline]
```

Insert a <key, data> pair into the map.

## Parameters

<i>key</i>	The key value.
<i>data</i>	The data value to insert.

## Returns

A pair of iterator (*first*) and return value (*second*). *second* will be 0 if the element was inserted into the set and `-#E_exist` if the key was already in the set and the set was therefore not updated. In both cases, *first* contains an iterator that points to the element. *second* may also be `-#E_nomem` when memory for the new node could not be allocated. *first* is then invalid.

Definition at line 110 of file [avl\\_map](#).

Here is the caller graph for this function:

### 15.19.3.2 `operator[]()` [1/2]

```

template<typename KEY_TYPE , typename DATA_TYPE , template< typename A > class COMPARE = Lt<
    _functor, template< typename B > class ALLOC = New_allocator>
Data_type & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
    Key_type const & key ) [inline]
  
```

Get or insert data for the given key.

#### Parameters

<i>key</i>	The key value to use for lookup.
------------	----------------------------------

#### Returns

If the item already exists, a reference to the data item. Otherwise a new data item is default-constructed and inserted under the given key before a reference is returned.

Definition at line 134 of file `avl_map`.

References `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::find_node()`, and `cxx::Avl_map< KEY_TYPE,`

Here is the call graph for this function:

### 15.19.3.3 `operator[]()` [2/2]

```

template<typename KEY_TYPE , typename DATA_TYPE , template< typename A > class COMPARE = Lt<
    _functor, template< typename B > class ALLOC = New_allocator>
Data_type const & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
    Key_type const & key ) const [inline]
  
```

Get the data for the given key.

**Parameters**

<i>key</i>	The key value to use for lookup.
------------	----------------------------------

**Precondition**

A `<key, data>` pair for the given key value must exist.

Definition at line 122 of file [avl\\_map](#).

### 15.20.1 Detailed Description

```
template<typename ITEM_TYPE, class COMPARE = Lt_functor<ITEM_TYPE>, template< typename A >
class ALLOC = New_allocator>
class cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >
```

AVL set for simple compareable items.

The AVL set can store any kind of items where a partial order is defined. The default relation is defined by the '<' operator.

#### Template Parameters

<i>ITEM_TYPE</i>	The type of the items to be stored in the set.
<i>COMPARE</i>	The relation to define the partial order, default is to use operator '<'.
<i>ALLOC</i>	The allocator to use for the nodes of the AVL set.

- `Bst_node * _head`  
*The head pointer of the tree.*

## 15.21.1 Detailed Description

```
template<typename Node, typename Get_key, typename Compare = Lt_functor<typename Get_key::Key↵
_type>>
class cxx::Avl_tree< Node, Get_key, Compare >
```

A generic AVL tree.

## Template Parameters

<i>Node</i>	The data type of the nodes (must inherit from <a href="#">Avl_tree_node</a> ).
<i>Get_key</i>	The meta function to get the key value from a node. The implementation uses <code>Get_key::key_of(ptr_to_node)</code> . The type of the key values must be defined in <code>Get_key::Key_type</code> .
<i>Compare</i>	Binary relation to establish a total order for the nodes of the tree. <code>Compare() (l, r)</code> must return true if the key <i>l</i> is smaller than the key <i>r</i> .

This implementation does not provide any memory management. It is the responsibility of the caller to allocate nodes before inserting them and to free them when they are removed or when the tree is destroyed. Conversely, the caller must also ensure that nodes are removed from the tree before they are destroyed.

## Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 111 of file [avl\\_tree](#).

## 15.21.2 Member Typedef Documentation

## 15.21.2.1 Iterator

```
template<typename Node , typename Get_key , typename Compare = Lt_functor<typename Get_key::Key_type>>
typedef Bst::Iterator cxx::Avl_tree< Node, Get_key, Compare >::Iterator
```

Forward iterator for the tree.

Definition at line 141 of file [avl\\_tree](#).

## 15.21.3 Member Function Documentation

15.21.3.1 `insert()`

```
template<typename Node , typename Get_key , class Compare >
Pair< Node *, bool > cxx::Avl_tree< Node, Get_key, Compare >::insert (
    Node * new_node )
```

Insert a new node into this AVL tree.

## Parameters

<i>new_node</i>	A pointer to the new node.
-----------------	----------------------------

## Returns

A pair, with *second* set to `true` and *first* pointing to *new\_node*, on success. If there is already a node with the same key then *first* points to this node and *second* is 'false'.

Definition at line 231 of file [avl\\_tree](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::insert\(\)](#).

Here is the caller graph for this function:

### 15.21.3.2 remove()

```

template<typename Node , typename Get_key , class Compare >
Node * cxx::Avl\_tree< Node, Get_key, Compare >::remove (
    Key_param_type key ) [inline]
  
```

Remove the node with *key* from the tree.

#### Parameters

<i>key</i>	The key to the node to remove.
------------	--------------------------------

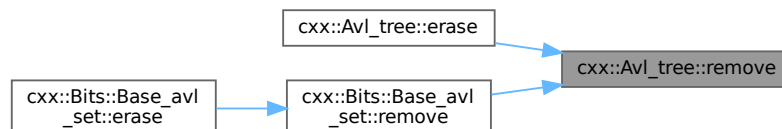

#### Returns

The pointer to the removed node on success, or 0 if no node with the *key* exists.

Definition at line 293 of file [avl\\_tree](#).

Referenced by [cxx::Avl\\_tree< Node, Get\\_key, Compare >::erase\(\)](#), and [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC,](#)

*Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.*

## 15.23.1 Detailed Description

```

template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc
= New_allocator>
class cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >

```

Basic slab allocator.

## Template Parameters

<i>Obj_size</i>	The size of the objects managed by the allocator (in bytes).
<i>Slab_size</i>	The size of a slab (in bytes).
<i>Max_free</i>	The maximum number of free slabs. When this limit is reached slabs are freed, provided that the backend allocator supports allocated memory to be freed.
<i>Alloc</i>	The backend allocator used to allocate slabs.

Definition at line 42 of file [slab\\_alloc](#).

## 15.23.2 Member Enumeration Documentation

### 15.23.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

## Enumerator

<code>object_size</code>	Size of an object.
<code>slab_size</code>	Size of a slab.
<code>objects_per_slab</code>	Objects per slab.
<code>max_free_slabs</code>	Maximum number of free slabs.

Definition at line 76 of file [slab\\_alloc](#).

## 15.23.3 Member Function Documentation

### 15.23.3.1 `alloc()`

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void * cxx::Base\_slab< Obj\_size, Slab\_size, Max\_free, Alloc >::alloc \( \) [inline], [noexcept]
```

Allocate a new object.

## Returns

A pointer to the new object if the allocation succeeds, or 0 on failure to acquire memory from the backend allocator when the slab cache memory is already exhausted.

**Note**

The user is responsible for initializing the object.

Definition at line 218 of file [slab\\_alloc](#).

References [cxx::Base\\_slab< Obj\\_size, Slab\\_size, Max\\_free, Alloc >::free\(\)](#), [cxx::H\\_list< T, POLICY >::push\\_front\(\)](#), and [cxx::H\\_list< T, POLICY >::remove\(\)](#).

*Get the total number of objects managed by the slab allocator.*
- `unsigned free\_objects ()` const noexcept  
*Get the number of free objects in the slab allocator.*

## 15.25.1 Detailed Description

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc
= New_allocator>
class cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >
```

Merged slab allocator (allocators for objects of the same size are merged together).

### Template Parameters

<i>Obj_size</i>	The size of an object managed by the slab allocator.
<i>Slab_size</i>	The size of a slab.
<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `Obj_size`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.

Definition at line 399 of file [slab\\_alloc](#).

## 15.25.2 Member Enumeration Documentation

### 15.25.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

### Enumerator

<code>object_size</code>	Size of an object.
<code>slab_size</code>	Size of a slab.
<code>objects_per_slab</code>	Number of objects per slab.
<code>max_free_slabs</code>	Maximum number of free slabs.

### 15.26.1 Detailed Description

```
template<typename T, unsigned LSB, unsigned MSB>
class cxx::Bitfield< T, LSB, MSB >
```

Definition for a member (part) of a bit field.

#### Parameters

<i>T</i>	The underlying type of the bit field.
<i>LSB</i>	The least significant bit of our bits.
<i>MSB</i>	The most significant bit of our bits.

Definition at line 35 of file [bitfield](#).

### 15.26.2 Member Typedef Documentation

#### 15.26.2.1 Bits\_type

```
template<typename T , unsigned LSB, unsigned MSB>
typedef Best_type<Bits>::Type cxx::Bitfield< T, LSB, MSB >::Bits_type
```

Type to hold at least [Bits](#) bits.

This type can handle all values that can be stored in this part of the bit field.

Definition at line 85 of file [bitfield](#).

### 15.26.2.2 Shift\_type

```
template<typename T , unsigned LSB, unsigned MSB>
typedef Best_type<Bits+Lsb>::Type cxx::Bitfield< T, LSB, MSB >::Shift_type
```

Type to hold at least `Bits + Lsb` bits.

This type can handle all values that can be stored in this part of the bit field when they are at the target location (`Lsb` bits shifted to the left).

Definition at line 93 of file `bitfield`.

## 15.26.3 Member Enumeration Documentation

### 15.26.3.1 anonymous enum

```
template<typename T , unsigned LSB, unsigned MSB>
anonymous enum
```

#### Enumerator

Bits	Number of bits.
Lsb	index of the LSB
Msb	index of the MSB

Definition at line 63 of file `bitfield`.

### 15.26.3.2 Masks

```
template<typename T , unsigned LSB, unsigned MSB>
enum cxx::Bitfield::Masks : Base_type
```

Masks for bitwise operation on internal parts of a bitfield.

#### Enumerator

Low_mask	Mask value to get <code>Bits</code> bits.
Mask	Mask value to the bits out of a <code>T</code> .

Definition at line 71 of file `bitfield`.

## 15.26.4 Member Function Documentation

### 15.26.4.1 get()

```
template<typename T , unsigned LSB, unsigned MSB>
static constexpr Bits_type cxx::Bitfield< T, LSB, MSB >::get (
    Shift_type val ) [inline], [static], [constexpr]
```

Get the bits out of `val`.

## Parameters

<i>val</i>	The raw value of the whole bit field.
------------	---------------------------------------

## Returns

The bits form [Lsb](#) to [Msb](#) shifted to the right.

Definition at line 110 of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Low\\_mask](#), [cxx::Bitfield< T, LSB, MSB >::Lsb](#), and [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

Here is the call graph for this function:

15.26.4.2 `get_unshifted()`

```

template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::get_unshifted (
    Shift_type val ) [inline], [static], [constexpr]
  
```

Get the bits in place out of `val`.

## Parameters

<i>val</i>	The raw value of the whole bit field.
------------	---------------------------------------

## Returns

The bits from [Lsb](#) to [Msb](#) (unshifted).

This means other bits are masked out, however the result is not shifted to the right.

Definition at line 123 of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Mask](#), and [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

Here is the call graph for this function:

### 15.26.4.3 `set()`

```
template<typename T , unsigned LSB, unsigned MSB>
static Base_type cxx::Bitfield< T, LSB, MSB >::set (
    Base_type dest,
    Bits_type val ) [inline], [static]
```

Set the bits corresponding to `val`.

#### Parameters

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value to set into the bits.

#### Returns

The new value of the whole bit field.

Definition at line 172 of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Low\\_mask](#), [cxx::Bitfield< T, LSB, MSB >::set\\_dirty\(\)](#), and [cxx::Bitfield< T, LSB, MSB >::val](#).

Here is the call graph for this function:

### 15.26.4.4 `set_dirty()`

```
template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_dirty (
    Base_type dest,
    Shift_type val ) [inline], [static], [constexpr]
```

Set the bits corresponding to `val`.

**Parameters**

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value to set into the bits.

**Returns**

The new value of the whole bit field.

**Precondition**

`val` must not contain more than [Bits](#) bits.

**Note**

This function does not mask `val` to the right number of bits.

Definition at line [138](#) of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Lsb](#), [cxx::Bitfield< T, LSB, MSB >::Mask](#), and [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

Referenced by [cxx::Bitfield< T, LSB, MSB >::set\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.26.4.5 set\_unshifted()**

```

template<typename T , unsigned LSB, unsigned MSB>
static Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted (
    Base_type dest,
    Shift_type val ) [inline], [static]
  
```

Set the bits corresponding to `val`.

## Parameters

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value shifted <code>Lsb</code> bits to the left that shall be set into the bit field.

## Returns

the new value of the whole bit field.

Definition at line 184 of file `bitfield`.

References `cxx::Bitfield< T, LSB, MSB >::Mask`, `cxx::Bitfield< T, LSB, MSB >::set_unshifted_dirty()`, and `cxx::Bitfield< T, LSB, MSB >::val()`.

Here is the call graph for this function:

15.26.4.6 `set_unshifted_dirty()`

```

template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted_dirty (
    Base_type dest,
    Shift_type val ) [inline], [static], [constexpr]

```

Set the bits corresponding to `val`.

## Parameters

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value shifted <code>Lsb</code> bits to the left that shall be set into the bits.

## Returns

The new value of the whole bit field.

## Precondition

`val` must not contain more than `Bits` bits shifted `Lsb` bits to the left.

**Note**

This function does not mask `val` to the right number of bits.

Definition at line 158 of file `bitfield`.

References `cxx::Bitfield< T, LSB, MSB >::Mask`, and `cxx::Bitfield< T, LSB, MSB >::val()`.

Referenced by `cxx::Bitfield< T, LSB, MSB >::set_unshifted()`.

Here is the call graph for this function:

Here is the caller graph for this function:

**15.26.4.7 val()**

```

template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val (
    Bits_type val ) [inline], [static], [constexpr]
  
```

Get the shifted bits for `val`.

**Parameters**

<i>val</i>	The value to set into the bits.
------------	---------------------------------

**Returns**

The raw bit field value.

Definition at line 207 of file `bitfield`.

References [cxx::Bitfield< T, LSB, MSB >::Low\\_mask](#), [cxx::Bitfield< T, LSB, MSB >::val\(\)](#), and [cxx::Bitfield< T, LSB, MSB >::val\\_dirty](#)

Here is the caller graph for this function:

#### 15.26.4.8 val\_dirty()

```

template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_dirty (
    Shift_type val ) [inline], [static], [constexpr]
  
```

Get the shifted bits for `val`.

## Parameters

<code>val</code>	The value to set into the bits.
------------------	---------------------------------

## Returns

The raw bit field value.

## Precondition

`val` must not contain more than [Bits](#) bits.

## Note

This function does not mask `val` to the right number of bits.

Definition at line 198 of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Lsb](#), and [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

Referenced by [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

Here is the caller graph for this function:

#### 15.26.4.9 `val_unshifted()`

```
template<typename T , unsigned LSB, unsigned MSB>
static constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_unshifted (
    Shift_type val ) [inline], [static], [constexpr]
```

Get the shifted bits for `val`.

##### Parameters

<code>val</code>	The value shifted <code>Lsb</code> bits to the left that shall be set into the bits.
------------------	--

##### Returns

The raw bit field value.

Definition at line 217 of file [bitfield](#).

References [cxx::Bitfield< T, LSB, MSB >::Mask](#), and [cxx::Bitfield< T, LSB, MSB >::val\(\)](#).

### Protected Attributes inherited from `cxx::Bitmap_base`

- `word_type * _bits`  
*Pointer to the buffer storing the bits.*

## 15.30.1 Detailed Description

```
template<int BITS>
class cxx::Bitmap< BITS >
```

A static bitmap.

## Template Parameters

<i>BITS</i>	The number of bits that shall be in the bitmap.
-------------	---

Definition at line 231 of file [bitmap](#).

## 15.30.2 Member Function Documentation

### 15.30.2.1 `scan_zero()`

```
template<int BITS>
long cxx::Bitmap< BITS >::scan_zero (
    long start_bit = 0 ) const [inline], [noexcept]
```

Scan for the first zero bit.

## Parameters

<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.
------------------	--

## Return values

<code>&gt;=</code>	0 Number of first zero bit found.
<code>-1</code>	All bits at <i>start_bit</i> or higher are set.

Compared to [Bitmap\\_base::scan\\_zero\(\)](#), the upper bound is set to BITS.

Definition at line 376 of file [bitmap](#).

## 15.31.1 Detailed Description

Basic bitmap abstraction.

This abstraction keeps a pointer to a memory area that is used as bitmap.

Definition at line 29 of file `bitmap`.

## 15.31.2 Member Enumeration Documentation

### 15.31.2.1 anonymous enum

```
anonymous enum [protected]
```

## Enumerator

W_bits	number of bits in word_type
C_bits	number of bits in char

Definition at line 37 of file [bitmap](#).

### 15.31.3 Member Function Documentation

#### 15.31.3.1 atomic\_clear\_bit()

```
void cxx::Bitmap_base::atomic_clear_bit (  
    long bit ) [inline], [noexcept]
```

Clear bit `bit` atomically.

Use this function for multi-threaded access to the bitmap.

## Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 280 of file [bitmap](#).

#### 15.31.3.2 atomic\_get\_and\_clear()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_clear (  
    long bit ) [inline], [noexcept]
```

Clear bit `bit` atomically and return old state.

Use this function for multi-threaded access to the bitmap.

## Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 290 of file [bitmap](#).

#### 15.31.3.3 atomic\_get\_and\_set()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_set (  
    long bit ) [inline], [noexcept]
```

Set bit `bit` atomically and return old state.

Use this function for multi-threaded access to the bitmap.

## Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 319 of file [bitmap](#).

**15.31.3.4 `atomic_set_bit()`**

```
void cxx::Bitmap_base::atomic_set_bit (
    long bit ) [inline], [noexcept]
```

Set bit `bit` atomically.

Use this function for multi-threaded access to the bitmap.

## Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 309 of file [bitmap](#).

**15.31.3.5 `bit()` [1/2]**

```
Bitmap_base::word_type cxx::Bitmap_base::bit (
    long bit ) const [inline], [noexcept]
```

Get the truth value of a bit.

## Parameters

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

## Return values

0	Bit is not set.
!= 0	Bit is set.

Definition at line 329 of file [bitmap](#).

**15.31.3.6 `bit()` [2/2]**

```
void cxx::Bitmap_base::bit (
    long bit,
    bool on ) [inline], [noexcept]
```

Set the value of bit `bit` to `on`.

## Parameters

<i>bit</i>	The number of the bit.
<i>on</i>	The boolean value that shall be assigned to the bit.

Definition at line [262](#) of file [bitmap](#).

Referenced by [operator\[\]\(\)](#), and [operator\[\]\(\)](#).

Here is the caller graph for this function:

### 15.31.3.7 `bit_index()`

```
static unsigned cxx::Bitmap_base::bit_index (
    unsigned bit ) [inline], [static], [protected]
```

Get the bit index within `word_type` for the given bit.

## Parameters

<i>bit</i>	The bit index in the bitmap.
------------	------------------------------

## Returns

the bit index within `word_type` (`bit % W_bits`).

Definition at line [64](#) of file [bitmap](#).

References [W\\_bits](#).

### 15.31.3.8 `clear_bit()`

```
void cxx::Bitmap_base::clear_bit (
    long bit ) [inline], [noexcept]
```

Clear bit `bit`.

## Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 271 of file [bitmap](#).

**15.31.3.9 operator[]() [1/2]**

```
word_type cxx::Bitmap_base::operator[] (
    long bit ) const [inline], [noexcept]
```

Get the bit at index `bit`.

## Parameters

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

## Return values

0	Bit is not set.
!= 0	Bit is set.

Definition at line 192 of file [bitmap](#).

References [bit\(\)](#).

Here is the call graph for this function:

**15.31.3.10 operator[]() [2/2]**

```
Bit cxx::Bitmap_base::operator[] (
    long bit ) [inline], [noexcept]
```

Get the lvalue for the bit at index `bit`.

## Parameters

<i>bit</i>	The number.
------------	-------------

**Returns**

lvalue for `bit`

Definition at line 202 of file [bitmap](#).

References [bit\(\)](#).

Here is the call graph for this function:

**15.31.3.11 scan\_zero()**

```

long cxx::Bitmap_base::scan_zero (
    long max_bit,
    long start_bit = 0 ) const [inline], [noexcept]
  
```

Scan for the first zero bit.

**Parameters**

<i>max_bit</i>	Upper bound (exclusive) for the scanning operation.
<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.

**Return values**

<code>&gt;=</code>	0 Number of first zero bit found.
<code>-1</code>	All bits between <i>start_bit</i> and <i>max_bit</i> are set.

Definition at line 350 of file [bitmap](#).

Referenced by [cxx::Bitmap< BITS >::scan\\_zero\(\)](#).

Here is the caller graph for this function:

**15.31.3.12 set\_bit()**

```
void cxx::Bitmap_base::set_bit (
    long bit ) [inline], [noexcept]
```

Set bit *bit*.

**Parameters**

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 300 of file [bitmap](#).

**15.31.3.13 word\_index()**

```
static unsigned cxx::Bitmap_base::word_index (
    unsigned bit ) [inline], [static], [protected]
```

Get the word index for the given bit.

**Parameters**

<i>bit</i>	The index of the bit in question.
------------	-----------------------------------

**Returns**

the index in [Bitmap\\_base::\\_bits](#) for the given bit (*bit* / *W\_bits*).

Definition at line 55 of file [bitmap](#).

References [W\\_bits](#).

The documentation for this class was generated from the following file:

- `Rev\_iterator rbegin ()`

*Get the mutable backward iterator for the last element of the set.*

- `Rev\_iterator rend ()`

*Get the end marker for the mutable backward iterator.*

### 15.37.1 Detailed Description

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename GET_KEY>
```

```
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >
```

Internal: AVL set with internally managed nodes.

Use [Avl\\_set](#), [Avl\\_map](#), or [Avl\\_tree](#) in applications.

## Template Parameters

<i>ITEM_TYPE</i>	The type of the items to be stored in the set.
<i>COMPARE</i>	The relation to define the partial order, default is to use operator '<'.
<i>ALLOC</i>	The allocator to use for the nodes of the AVL set.
<i>GET_KEY</i>	Sort-key getter (must provide the <i>Key_type</i> and sort-key for an item (of <i>ITEM_TYPE</i> )).

Definition at line 133 of file [avl\\_set](#).

## 15.37.2 Member Enumeration Documentation

### 15.37.2.1 anonymous enum

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
anonymous enum
```

Return status constants.

These constants are compatible with the [L4](#) error codes, see [l4\\_error\\_code\\_t](#).

## Enumerator

E_noent	Item does not exist.
E_exist	Item exists already.
E_nomem	Memory allocation failed.
E_inval	Internal error.

Definition at line 144 of file [avl\\_set](#).

## 15.37.3 Constructor & Destructor Documentation

### 15.37.3.1 Base\_avl\_set() [1/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Base_avl_set (
    Node_allocator const & alloc = Node_allocator() ) [inline], [explicit]
```

Create a AVL-tree based set.

## Parameters

<i>alloc</i>	<a href="#">Node</a> allocator.
--------------	---------------------------------

Create an empty set (AVL-tree based).

Definition at line 254 of file [avl\\_set](#).

## 15.37.3.2 Base\_avl\_set() [2/2]

```
template<typename Item , class Compare , template< typename A > class Alloc, typename KEY_TYPE >
cxx::Bits::Base_avl_set< Item, Compare, Alloc, KEY_TYPE >::Base_avl_set (
    Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > const & o ) [inline]
```

Create a copy of an AVL-tree based set.

## Parameters

<i>o</i>	The set to copy.
----------	------------------

Creates a deep copy of the set with all its items.

Definition at line 413 of file [avl\\_set](#).

References [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::begin\(\)](#), [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::end\(\)](#) and [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::insert\(\)](#).

## 15.37.4 Member Function Documentation

## 15.37.4.1 begin() [1/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin ( ) [inline]
```

Get the mutable forward iterator for the first element of the set.

## Returns

The mutable forward iterator for the first element of the set.

Definition at line 367 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::begin\(\)](#).

Here is the call graph for this function:

### 15.37.4.2 begin() [2/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin ( ) const
[inline]
```

Get the constant forward iterator for the first element in the set.

#### Returns

Constant forward iterator for the first element in the set.

Definition at line 356 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::begin\(\)](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::Base\\_avl\\_set\(\)](#).

### 15.37.4.3 end() [1/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end ( ) [inline]
```

Get the end marker for the mutable forward iterator.

**Returns**

The end marker for mutable forward iterator.

Definition at line 372 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::end\(\)](#).

Here is the call graph for this function:

**15.37.4.4 end() [2/2]**

```

template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end ( ) const
[inline]
  
```

Get the end marker for the constant forward iterator.

**Returns**

The end marker for the constant forward iterator.

Definition at line 361 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::end\(\)](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::Base\\_avl\\_set\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.37.4.5 erase()

```

template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::erase (
    Key_type const & item ) [inline]
  
```

Erase the item with the given key.

##### Parameters

<i>item</i>	The key of the item to remove.
-------------	--------------------------------

Definition at line 324 of file [avl\\_set](#).

References [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::remove\(\)](#).

Here is the call graph for this function:

#### 15.37.4.6 find\_node()

```

template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::find_node (
    Key_type const & item ) const [inline]
  
```

Lookup a node equal to *item*.

## Parameters

<i>item</i>	The value to search for.
-------------	--------------------------

## Returns

A smart pointer to the element found. If no element was found the smart pointer will be invalid.

Definition at line 335 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::find\\_node\(\)](#).

Referenced by [cxx::Avl\\_map< KEY\\_TYPE, DATA\\_TYPE, COMPARE, ALLOC >::operator\[\]\(\)](#), and [cxx::Avl\\_map< KEY\\_TYPE, DATA](#)

Here is the call graph for this function:

Here is the caller graph for this function:

## 15.37.4.7 insert()

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
```

```
Pair< typename Base_avl_set< Item, Compare, Alloc, KEY_TYPE >::Iterator, int > cxx::Bits::Base_avl_set<
Item, Compare, Alloc, KEY_TYPE >::insert (
    Item_type const & item )
```

Insert an item into the set.

## Parameters

<i>item</i>	The item to insert.
-------------	---------------------

**Returns**

A pair of iterator (*first*) and return value (*second*). *second* will be 0 if the element was inserted into the set and `-#E_exist` if the element was already in the set and the set was therefore not updated. In both cases, *first* contains an iterator that points to the element. *second* may also be `-#E_nomem` when memory for the node could not be allocated. *first* is then invalid.

Insert a new item into the set, each item can only be once in the set.

Definition at line 423 of file [avl\\_set](#).

References [cxx::Pair< First, Second >::first](#), [cxx::Avl\\_tree< Node, Get\\_key, Compare >::insert\(\)](#), and [cxx::Pair< First, Second >::second](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::Base\\_avl\\_set\(\)](#), and [cxx::Avl\\_map< KEY\\_TYPE, DATA\\_TYPE, COMPARE, ALLOC >::insert\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.37.4.8 lower\_bound\_node()**

```

template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::lower_bound_node (
    Key_type const & key ) const [inline]
  
```

Find the first node greater or equal to *key*.

**Parameters**

<i>key</i>	Minimum key to look for.
------------	--------------------------

## 15.37 `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >` Class Template Reference 17

### Returns

Smart pointer to the first node greater or equal to `key`. Will be invalid if no such element was found.

Definition at line 346 of file `avl_set`.

References `cxx::Bits::Bst< Node, Get_key, Compare >::lower_bound_node()`.

Here is the call graph for this function:

### 15.37.4.9 `rbegin()` [1/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename GET_KEY >
```

```
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin ( ) [inline]
```

Get the mutable backward iterator for the last element of the set.

### Returns

The mutable backward iterator for the last element of the set.

Definition at line 389 of file `avl_set`.

References `cxx::Bits::Bst< Node, Get_key, Compare >::rbegin()`.

Here is the call graph for this function:

#### 15.37.4.10 `rbegin()` [2/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin ( )
const [inline]
```

Get the constant backward iterator for the last element in the set.

##### Returns

The constant backward iterator for the last element in the set.

Definition at line 378 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::rbegin\(\)](#).

Here is the call graph for this function:

#### 15.37.4.11 `remove()`

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::remove (
    Key_type const & item ) [inline]
```

Remove an item from the set.

##### Parameters

<i>item</i>	The item to remove.
-------------	---------------------

##### Return values

0	Success
-E_noent	Item does not exist

Definition at line 306 of file [avl\\_set](#).

References [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::E\\_noent](#), and [cxx::Avl\\_tree< Node, Get\\_key,](#)

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::erase\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.37.4.12 rend() [1/2]

```

template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend ( ) [inline]
  
```

Get the end marker for the mutable backward iterator.

##### Returns

The end marker for mutable backward iterator.

Definition at line 394 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::rend\(\)](#).

Here is the call graph for this function:

**15.37.4.13** `rend()` [2/2]

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename
GET_KEY >
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend ( )
const [inline]
```

Get the end marker for the constant backward iterator.

**Returns**

The end marker for the constant backward iterator.

Definition at line 383 of file [avl\\_set](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::rend\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

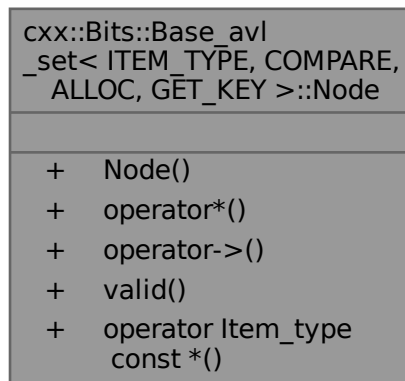

- [l4/cxx/avl\\_set](#)

## 15.38 `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node` Class Reference

A smart pointer to a tree item.

```
#include <avl_set>
```

Collaboration diagram for `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node`:

## Public Member Functions

- **Node ()**

### 15.38.1 Detailed Description

```

template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node
  
```

A smart pointer to a tree item.

Definition at line 183 of file `avl_set`.

## 15.38.2 Member Function Documentation

### 15.38.2.1 operator\*()

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename  
GET_KEY >  
Item_type const & cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator*  
( ) [inline]
```

Dereference the pointer.

#### Precondition

[Node](#) is valid.

Definition at line 200 of file [avl\\_set](#).

### 15.38.2.2 operator->()

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename  
GET_KEY >  
Item_type const * cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator->  
( ) [inline]
```

Dereferenced member access.

#### Precondition

[Node](#) is valid.

Definition at line 206 of file [avl\\_set](#).

### 15.38.2.3 valid()

```
template<typename ITEM_TYPE , class COMPARE , template< typename A > class ALLOC, typename  
GET_KEY >  
bool cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::valid ( ) const  
[inline]
```

Validity check.

#### Returns

false if the pointer is NIL, true if valid.

Definition at line 212 of file [avl\\_set](#).

The documentation for this class was generated from the following file:

- [I4/cxx/avl\\_set](#)

- Return the first element in the list.*
- void **clear** ()  
*Remove all elements from the list.*
- Iterator **begin** ()  
*Return an iterator to the beginning of the list.*
- Const\_iterator **begin** () const  
*Return a const iterator to the beginning of the list.*
- Const\_iterator **end** () const  
*Return a const iterator to the end of the list.*
- Iterator **end** ()  
*Return an iterator to the end of the list.*

### Static Public Member Functions

- static Const\_iterator **iter** (Const\_value\_type c)  
*Return a const iterator that begins at the given element.*

### Protected Attributes

- POLICY::Head\_type \_f  
*Pointer to front of the list.*

## 15.39.1 Detailed Description

**template<typename POLICY>**  
**class cxx::Bits::Basic\_list< POLICY >**

Internal: Common functions for all head-based list implementations.

Definition at line 50 of file [list\\_basics.h](#).

## 15.39.2 Member Function Documentation

### 15.39.2.1 clear()

```
template<typename POLICY >
void cxx::Bits::Basic_list< POLICY >::clear ( ) [inline]
```

Remove all elements from the list.

After the operation the state of the elements is undefined.

Definition at line 146 of file [list\\_basics.h](#).

References [cxx::Bits::Basic\\_list< POLICY >::\\_f](#).

### 15.39.2.2 iter()

```
template<typename POLICY >
static Const_iterator cxx::Bits::Basic_list< POLICY >::iter (
    Const_value_type c ) [inline], [static]
```

Return a const iterator that begins at the given element.

## Parameters

c	Element where the iterator should start.
---	--

### Precondition

The element `c` must already be in a list.

Definition at line 159 of file list\_basics.h.

The documentation for this class was generated from the following file:

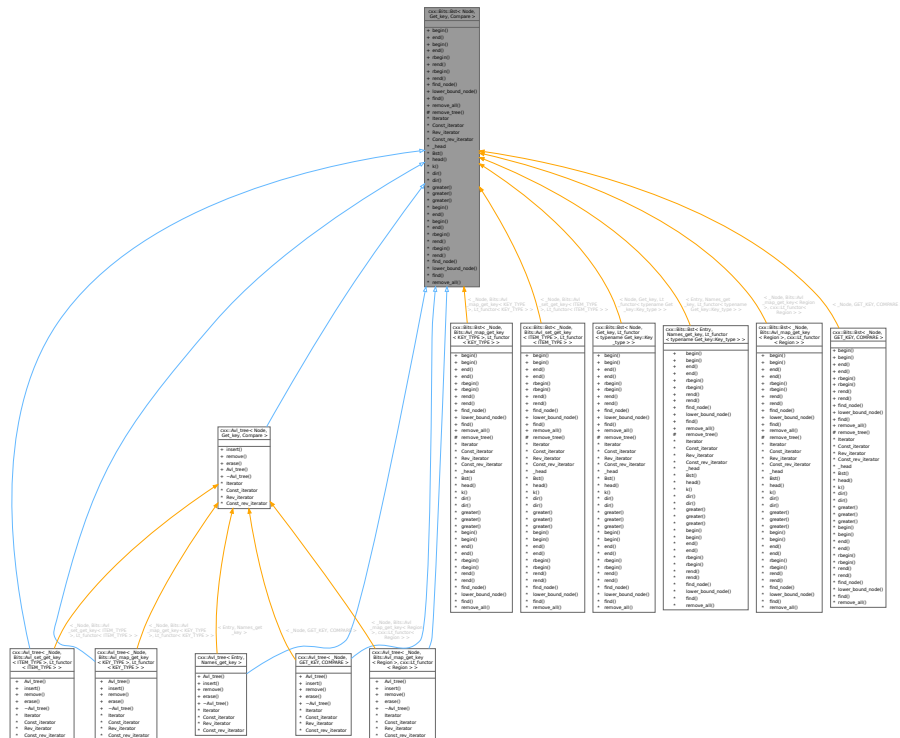

- `l4/cxx/bits/list_basics.h`

## 15.40 cxx::Bits::Bst< Node, Get\_key, Compare > Class Template Reference

Basic binary search tree (BST).

```
#include <bst.h>
```

Inheritance diagram for `cxx::Bits::Bst< Node, Get_key, Compare >`:

## 15.40.1 Detailed Description

```
template<typename Node, typename Get_key, typename Compare>
class cxx::Bits::Bst< Node, Get_key, Compare >
```

Basic binary search tree (BST).

This class is intended as a base class for concrete binary search trees, such as an AVL tree. This class already provides the basic lookup methods and iterator definitions for a BST.

Definition at line 42 of file [bst.h](#).

## 15.40.2 Member Function Documentation

### 15.40.2.1 begin() [1/2]

```
template<typename Node , typename Get_key , typename Compare >
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin ( ) [inline]
```

Get the mutable forward iterator for the first element of the set.

**Returns**

The mutable forward iterator for the first element of the set.

Definition at line 194 of file [bst.h](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::head\(\)](#).

Here is the call graph for this function:

**15.40.2.2 begin() [2/2]**

```
template<typename Node , typename Get_key , typename Compare >
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin ( ) const [inline]
```

Get the constant forward iterator for the first element in the set.

**Returns**

Constant forward iterator for the first element in the set.

Definition at line 183 of file [bst.h](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::head\(\)](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::begin\(\)](#), and [cxx::Bits::Base\\_avl\\_set< ITEM](#)

Here is the call graph for this function:

Here is the caller graph for this function:

**15.40.2.3** `dir()` [1/2]

```
template<typename Node , typename Get_key , typename Compare >
static Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
    Key_param_type l,
    Bst_node const * r ) [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

**Parameters**

<code>l</code>	is the key to look for.
<code>r</code>	is the node at the current position.

**Return values**

<code>Direction::L</code>	For left.
<code>Direction::R</code>	For right.
<code>Direction::N</code>	If <code>l</code> is equal to <code>r</code> .

Definition at line 139 of file `bst.h`.

References `cxx::Bits::Bst< Node, Get_key, Compare >::dir()`, and `cxx::Bits::Bst< Node, Get_key, Compare >::k()`.

Here is the call graph for this function:

**15.40.2.4** `dir()` [2/2]

```
template<typename Node , typename Get_key , typename Compare >
static Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
    Key_param_type l,
    Key_param_type r ) [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

**Parameters**

<code>l</code>	is the key to look for.
<code>r</code>	is the key at the current position.

## Return values

<a href="#"><code>Direction::L</code></a>	for left
<a href="#"><code>Direction::R</code></a>	for right
<a href="#"><code>Direction::N</code></a>	if <code>l</code> is equal to <code>r</code> .

Definition at line 122 of file [bst.h](#).

References [`cxx::Bits::Direction::L`](#), and [`cxx::Bits::Direction::N`](#).

Referenced by [`cxx::Bits::Bst< Node, Get\_key, Compare >::dir\(\)`](#).

Here is the caller graph for this function:

15.40.2.5 `end()` [1/2]

```
template<typename Node , typename Get_key , typename Compare >
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::end ( ) [inline]
```

Get the end marker for the mutable forward iterator.

## Returns

The end marker for mutable forward iterator.

Definition at line 199 of file [bst.h](#).

15.40.2.6 `end()` [2/2]

```
template<typename Node , typename Get_key , typename Compare >
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::end ( ) const [inline]
```

Get the end marker for the constant forward iterator.

**Returns**

The end marker for the constant forward iterator.

Definition at line 188 of file [bst.h](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::end\(\)](#), and [cxx::Bits::Base\\_avl\\_set< ITEM](#)

Here is the caller graph for this function:

**15.40.2.7 find()**

```

template<typename Node , typename Get_key , class Compare >
Bst< Node, Get_key, Compare >::Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::find
(
    Key_param_type key ) const [inline]
  
```

find the node with the given *key*.

**Parameters**

<i>key</i>	The key value of the element to search.
------------	---

**Returns**

A valid iterator for the node with the given *key*, or an invalid iterator if *key* was not found.

Definition at line 316 of file [bst.h](#).

References [cxx::Bits::Bst\\_node::next\(\)](#).

Here is the call graph for this function:

## 15.40.2.8 find\_node()

```
template<typename Node , typename Get_key , class Compare >
Node * cxx::Bits::Bst< Node, Get_key, Compare >::find_node (
    Key_param_type key ) const [inline]
```

find the node with the given *key*.

## Parameters

<i>key</i>	The key value of the element to search.
------------	---

## Returns

A pointer to the node with the given *key*, or NULL if *key* was not found.

Definition at line 280 of file [bst.h](#).

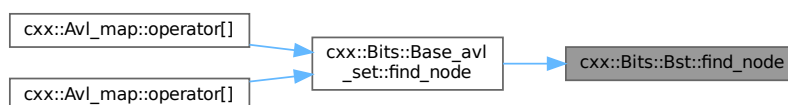

References [cxx::Bits::Bst\\_node::next\(\)](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< ITEM\\_TYPE, COMPARE, ALLOC, GET\\_KEY >::find\\_node\(\)](#).

## 15.40.2.9 lower\_bound\_node()

```
template<typename Node , typename Get_key , class Compare >
Node * cxx::Bits::Bst< Node, Get_key, Compare >::lower_bound_node (
    Key_param_type key ) const [inline]
```

Find the first node with a key not less than the given *key*.

## Parameters

<i>key</i>	The key used for the search.
------------	------------------------------

## Returns

A pointer to the found node, or `NULL` if no node was found.

Definition at line 296 of file `bst.h`.

References `cxx::Bits::Bst_node::next()`.

Referenced by `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::lower_bound_node()`.

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.40.2.10 `rbegin()` [1/2]

```

template<typename Node , typename Get_key , typename Compare >
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin ( ) [inline]
  
```

Get the mutable backward iterator for the last element of the set.

**Returns**

The mutable backward iterator for the last element of the set.

Definition at line 216 of file `bst.h`.

References `cxx::Bits::Bst< Node, Get_key, Compare >::head()`.

Here is the call graph for this function:

**15.40.2.11 rbegin() [2/2]**

```
template<typename Node , typename Get_key , typename Compare >
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin ( ) const [inline]
```

Get the constant backward iterator for the last element in the set.

**Returns**

The constant backward iterator for the last element in the set.

Definition at line 205 of file `bst.h`.

References `cxx::Bits::Bst< Node, Get_key, Compare >::head()`.

Referenced by `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin()`, and `cxx::Bits::Base_avl_set< ITE`

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.40.2.12 remove\_all()

```

template<typename Node , typename Get_key , typename Compare >
template<typename FUNC >
void cxx::Bits::Bst< Node, Get_key, Compare >::remove_all (
    FUNC && callback ) [inline]
  
```

Clear the tree.

##### Parameters

<i>callback</i>	Optional function to be called on each removed element.
-----------------	---

The callback may delete the elements. The function guarantees that the elements are no longer used after the callback has been called.

Definition at line 262 of file [bst.h](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::\\_head](#), [cxx::Bits::Bst< Node, Get\\_key, Compare >::head\(\)](#), and [cxx::Bits::Bst< Node, Get\\_key, Compare >::remove\\_tree\(\)](#).

Referenced by [cxx::Avl\\_tree< Node, Get\\_key, Compare >::~~Avl\\_tree\(\)](#).

### 15.40.2.13 remove\_tree()

```

template<typename Node , typename Get_key , typename Compare >
template<typename FUNC >
static void cxx::Bits::Bst< Node, Get_key, Compare >::remove_tree (
    Bst_node * head,
    FUNC && callback ) [inline], [static], [protected]
  
```

Remove all elements in the subtree of head.

#### Parameters

<i>head</i>	Head of the the subtree to remove
<i>callback</i>	Optional function called on each removed element.

Definition at line 162 of file [bst.h](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::head\(\)](#), [cxx::Bits::Direction::L](#), [cxx::Bits::Bst\\_node::next\(\)](#), [cxx::Bits::Direction::R](#), and [cxx::Bits::Bst< Node, Get\\_key, Compare >::remove\\_tree\(\)](#).

Referenced by [cxx::Bits::Bst< Node, Get\\_key, Compare >::remove\\_all\(\)](#), and [cxx::Bits::Bst< Node, Get\\_key, Compare >::remove\\_tr](#)

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.40.2.14 `rend()` [1/2]

```
template<typename Node , typename Get_key , typename Compare >
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend ( ) [inline]
```

Get the end marker for the mutable backward iterator.

##### Returns

The end marker for mutable backward iterator.

Definition at line 221 of file [bst.h](#).

#### 15.40.2.15 `rend()` [2/2]

```
template<typename Node , typename Get_key , typename Compare >
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend ( ) const [inline]
```

Get the end marker for the constant backward iterator.

##### Returns

The end marker for the constant backward iterator.

Definition at line 210 of file [bst.h](#).

Referenced by `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend()`, and `cxx::Bits::Base_avl_set< ITEM`

#	Bst_node()
#	next()
#	next()
#	next_p()
#	next()
#	rotate()
*	next()
*	next()
*	next_p()
*	next()
*	rotate()

### Protected Member Functions

- **Bst\_node** ()  
*Create uninitialized node.*
- **Bst\_node** (bool)  
*Create initialized node.*

### Static Protected Member Functions

#### Access to BST linkage.

Provide access to the tree linkage to inherited classes. Inherited nodes, such as AVL nodes should make these methods private via 'using'

- static `Bst_node` \* **next** (`Bst_node` const \*p, `Direction` d)  
*Get next node in direction d.*
- static void **next** (`Bst_node` \*p, `Direction` d, `Bst_node` \*n)  
*Set next node of p in direction d to n.*
- static `Bst_node` \*\* **next\_p** (`Bst_node` \*p, `Direction` d)  
*Get pointer to link in direction d.*
- template<typename Node >  
static Node \* **next** (`Bst_node` const \*p, `Direction` d)  
*Get next node in direction d as type Node.*
- static void **rotate** (`Bst_node` \*\*t, `Direction` idir)  
*Rotate subtree t in the opposite direction of idir.*

### 15.41.1 Detailed Description

Basic type of a node in a binary search tree (BST).

Definition at line 81 of file [bst\\_base.h](#).

The documentation for this class was generated from the following file:

- [l4/cxx/bits/bst\\_base.h](#)

## 15.42 cxx::Bits::Direction Struct Reference

The direction to go in a binary search tree.

```
#include <bst_base.h>
```

Collaboration diagram for cxx::Bits::Direction:

### Public Member Functions

- void **push\_front** (Next\_type &&e)  
*Add an element to the front of the list.*
- void **push\_front** (Next\_type const &e)  
*Add an element to the front of the list.*
- void **push\_back** (Next\_type &&e)  
*Add an element at the end of the list.*
- void **push\_back** (Next\_type const &e)  
*Add an element at the end of the list.*
- Value\_type \* **front** () const  
*Return a pointer to the first element in the list.*
- Next\_type **pop\_front** ()  
*Remove the element in front of the list and return it.*
- bool **empty** () const  
*Check if the list is empty.*

### 15.43.1 Detailed Description

```
template<typename ITEM>
class cxx::Bits::Smart_ptr_list< ITEM >
```

[List](#) of smart-pointer-managed objects.

#### Template Parameters

<i>ITEM</i>	Type of the list items.
-------------	-------------------------

The list is implemented as a single-linked list connected via smart pointers, so that they are automatically cleaned up when they are removed from the list.

Definition at line 47 of file [smart\\_ptr\\_list.h](#).

## 15.43.2 Member Function Documentation

### 15.43.2.1 pop\_front()

```
template<typename ITEM >
Next_type cxx::Bits::Smart_ptr_list< ITEM >::pop_front ( ) [inline]
```

Remove the element in front of the list and return it.

#### Returns

The element that was previously in front of the list as a managed pointer or a nullptr-equivalent when the list was already empty.

Definition at line 150 of file [smart\\_ptr\\_list.h](#).

The documentation for this class was generated from the following file:

- l4/cxx/bits/[smart\\_ptr\\_list.h](#)

## 15.44 cxx::Bits::Smart\_ptr\_list\_item< T, STORE\_T > Class Template Reference

[List](#) item for an arbitrary item in a [Smart\\_ptr\\_list](#).

```
#include <smart_ptr_list.h>
```

Inheritance diagram for cxx::Bits::Smart\_ptr\_list\_item< T, STORE\_T >:

Collaboration diagram for cxx::Bits::Smart\_ptr\_list\_item< T, STORE\_T >:

### 15.44.1 Detailed Description

```

template<typename T, typename STORE_T>
class cxx::Bits::Smart_ptr_list_item< T, STORE_T >

```

List item for an arbitrary item in a [Smart\\_ptr\\_list](#).

## Template Parameters

<i>T</i>	Type of object to be stored in the list.
<i>STORE</i> <i>_T</i>	Storage type for pointer to next item. The class must implement a get() function that returns a pointer to the stored object and destroy the stored object when the item goes out of scope.

Definition at line 28 of file [smart\\_ptr\\_list.h](#).

The documentation for this class was generated from the following file:

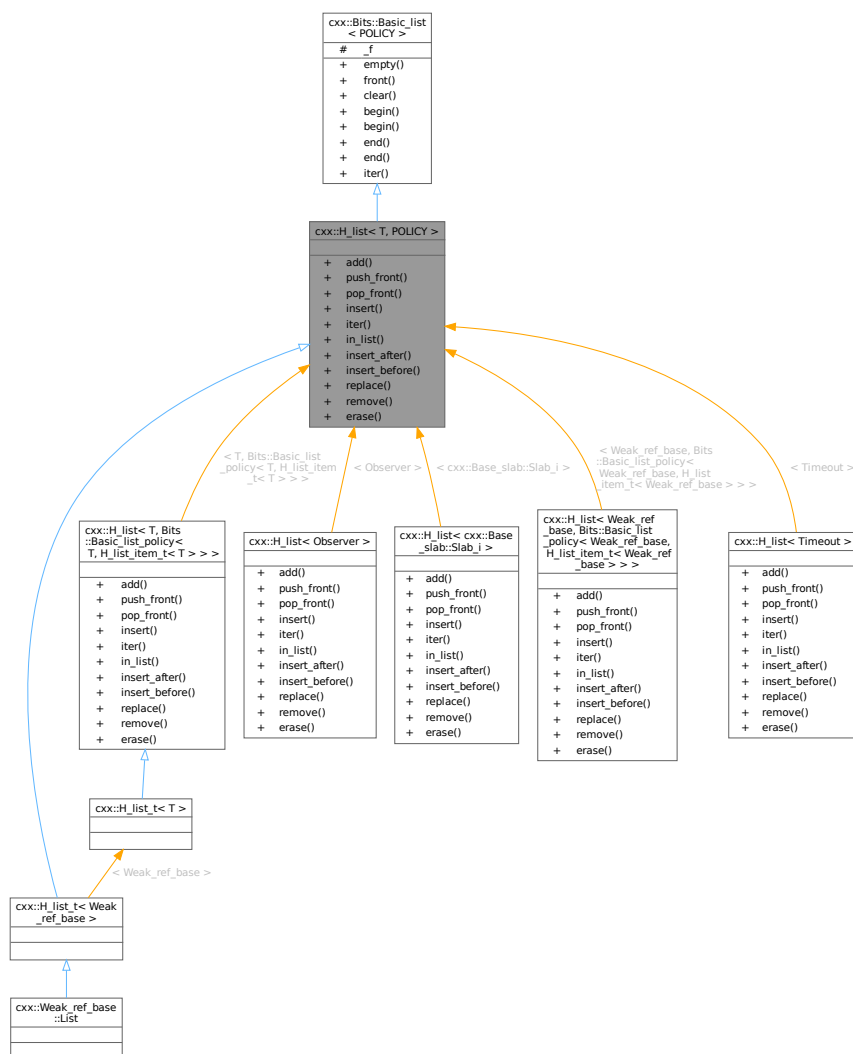

- [I4/cxx/bits/smart\\_ptr\\_list.h](#)

## 15.45 cxx::H\_list< T, POLICY > Class Template Reference

General double-linked list of unspecified [cxx::H\\_list\\_item](#) elements.

```
#include <hlist>
```

Inheritance diagram for `cxx::H_list< T, POLICY >`:

Collaboration diagram for cxx::H\_list< T, POLICY >:

## Public Member Functions

- void **add** (T \*e)  
*Add element to the front of the list.*
- void **push\_front** (T \*e)  
*Add element to the front of the list.*
- T \* **pop\_front** ()  
*Remove and return the head element of the list.*
- Iterator **insert** (T \*e, Iterator const &pred)  
*Insert an element at the iterator position.*

## Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- `bool empty ()` `const`  
*Check if the list is empty.*
- `Value_type front ()` `const`  
*Return the first element in the list.*
- `void clear ()`  
*Remove all elements from the list.*
- `Iterator begin ()`  
*Return an iterator to the beginning of the list.*
- `Const_iterator begin ()` `const`  
*Return a const iterator to the beginning of the list.*
- `Const_iterator end ()` `const`  
*Return a const iterator to the end of the list.*
- `Iterator end ()`  
*Return an iterator to the end of the list.*

## Static Public Member Functions

- `static Iterator iter (T *c)`  
*Return an iterator for an arbitrary list element.*
- `static bool in_list (T const *e)`  
*Check if the given element is currently part of a list.*
- `static Iterator insert_after (T *e, Iterator const &pred)`  
*Insert an element after the iterator position.*
- `static void insert_before (T *e, Iterator const &succ)`  
*Insert an element before the iterator position.*
- `static void replace (T *p, T *e)`  
*Replace an element in a list with a new element.*
- `static void remove (T *e)`  
*Remove the given element from its list.*
- `static Iterator erase (Iterator const &e)`  
*Remove the element at the given iterator position.*

## Static Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- `static Const_iterator iter (Const_value_type c)`  
*Return a const iterator that begins at the given element.*

## Additional Inherited Members

## Protected Attributes inherited from `cxx::Bits::Basic_list< POLICY >`

- `POLICY::Head_type _f`  
*Pointer to front of the list.*

### 15.45.1 Detailed Description

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
class cxx::H_list< T, POLICY >
```

General double-linked list of unspecified [cxx::H\\_list\\_item](#) elements.

Most of the time, you want to use [H\\_list\\_t](#).

Definition at line 80 of file [hlist](#).

### 15.45.2 Member Function Documentation

#### 15.45.2.1 erase()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static Iterator cxx::H\_list< T, POLICY >::erase (
    Iterator const & e ) [inline], [static]
```

Remove the element at the given iterator position.

##### Parameters

<i>e</i>	Iterator pointing to the element to be removed. Must not point to <a href="#">end()</a> .
----------	---

##### Returns

New iterator pointing to the element after the removed one.

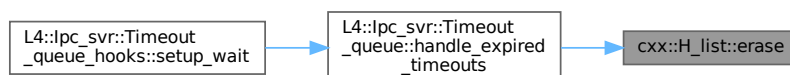

##### Note

The hlist implementation guarantees that the original iterator is still valid after the element has been removed. In fact, the iterator returned is the same as the one supplied in the *e* parameter.

Definition at line 247 of file [hlist](#).

Referenced by [L4::lpc\\_svr::Timeout\\_queue::handle\\_expired\\_timeouts\(\)](#).

Here is the caller graph for this function:

### 15.45.2.2 insert()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::insert (
    T * e,
    Iterator const & pred ) [inline]
```

Insert an element at the iterator position.

#### Parameters

<i>e</i>	New Element to be inserted
<i>pred</i>	Iterator pointing to the element after which the element will be inserted. If <a href="#">end()</a> is given, the element will be inserted at the beginning of the queue.

#### Returns

Iterator pointing to the newly inserted element.

Definition at line 144 of file [hlist](#).

References [cxx::Bits::Basic\\_list< POLICY >::\\_f](#), [cxx::Bits::Basic\\_list< POLICY >::end\(\)](#), and [cxx::H\\_list< T, POLICY >::iter\(\)](#).

Here is the call graph for this function:

### 15.45.2.3 insert\_after()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static Iterator cxx::H_list< T, POLICY >::insert_after (
    T * e,
    Iterator const & pred ) [inline], [static]
```

Insert an element after the iterator position.

#### Parameters

<i>e</i>	New element to be inserted.
<i>pred</i>	Iterator pointing to the element after which the element will be inserted. Must not be <a href="#">end()</a> .

**Returns**

Iterator pointing to the newly inserted element.

**Precondition**

The list must not be empty.

Definition at line 171 of file [hlist](#).

References [cxx::H\\_list< T, POLICY >::iter\(\)](#).

Here is the call graph for this function:

**15.45.2.4 insert\_before()**

```

template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static void cxx::H\_list< T, POLICY >::insert\_before (
    T * e,
    Iterator const & succ ) [inline], [static]
  
```

Insert an element before the iterator position.

**Parameters**

<i>e</i>	New element to be inserted.
<i>succ</i>	Iterator pointing to the element before which the element will be inserted. Must not be <a href="#">end()</a> .

Definition at line 191 of file [hlist](#).

Referenced by [L4::lpc\\_svr::Timeout\\_queue::add\(\)](#).

Here is the caller graph for this function:

### 15.45.2.5 iter()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static Iterator cxx::H\_list< T, POLICY >::iter (
    T * c ) [inline], [static]
```

Return an iterator for an arbitrary list element.

#### Parameters

<b>c</b>	List element to start the iteration.
----------	--------------------------------------

#### Returns

A mutable forward iterator.

#### Precondition

The element must be in a list.

Definition at line 104 of file [hlist](#).

Referenced by [cxx::H\\_list< T, POLICY >::insert\(\)](#), and [cxx::H\\_list< T, POLICY >::insert\\_after\(\)](#).

Here is the caller graph for this function:

### 15.45.2.6 pop\_front()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
T * cxx::H\_list< T, POLICY >::pop_front ( ) [inline]
```

Remove and return the head element of the list.

**Precondition**

The list must not be empty or the behaviour will be undefined.

Definition at line 127 of file [hlist](#).

References [cxx::Bits::Basic\\_list< POLICY >::front\(\)](#), and [cxx::H\\_list< T, POLICY >::remove\(\)](#).

Here is the call graph for this function:

**15.45.2.7 remove()**

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static void cxx::H_list< T, POLICY >::remove (
    T * e ) [inline], [static]
```

Remove the given element from its list.

**Parameters**

<code>e</code>	Element to be removed. Must be in a list.
----------------	---

Definition at line 231 of file [hlist](#).

Referenced by [cxx::Base\\_slab< Obj\\_size, Slab\\_size, Max\\_free, Alloc >::alloc\(\)](#), [cxx::Base\\_slab< Obj\\_size, Slab\\_size, Max\\_free, Alloc >::free\(\)](#), [cxx::H\\_list< T, POLICY >::pop\\_front\(\)](#), and [L4::lpc\\_svr::Timeout\\_queue::remove\(\)](#).

Here is the caller graph for this function:

### 15.45.2.8 replace()

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
static void cxx::H_list< T, POLICY >::replace (
    T * p,
    T * e ) [inline], [static]
```

Replace an element in a list with a new element.

#### Parameters

<i>p</i>	Element in list to be replaced.
<i>e</i>	Replacement element, must not yet be in a list.

#### Precondition

*p* and *e* must not be NULL.

After the operation the *p* element is no longer in the list and may be reused.

Definition at line 215 of file [hlist](#).

## 15.46 cxx::H\_list\_item\_t< ELEM\_TYPE > Class Template Reference

Basic element type for a double-linked [H\\_list](#).

```
#include <hlist>
```

Inheritance diagram for `cxx::H_list_item_t< ELEM_TYPE >`:

Collaboration diagram for cxx::H\_list\_item\_t< ELEM\_TYPE >:

## Public Member Functions

- `H_list_item_t ()`  
*Constructor.*
- `~H_list_item_t () noexcept`  
*Destructor.*

### 15.46.1 Detailed Description

```
template<typename ELEM_TYPE>
class cxx::H_list_item_t< ELEM_TYPE >
```

Basic element type for a double-linked [H\\_list](#).

#### Template Parameters

<i>ELEM_TYPE</i>	Base class of the list element.
------------------	---------------------------------

Definition at line [33](#) of file [hlist](#).

### 15.46.2 Constructor & Destructor Documentation

#### 15.46.2.1 H\_list\_item\_t()

```
template<typename ELEM_TYPE >
cxx::H_list_item_t< ELEM_TYPE >::H_list_item_t ( ) [inline]
```

Constructor.

Creates an element that is not in any list.

Definition at line [41](#) of file [hlist](#).

#### 15.46.2.2 ~H\_list\_item\_t()

```
template<typename ELEM_TYPE >
cxx::H_list_item_t< ELEM_TYPE >::~~H_list_item_t ( ) [inline], [noexcept]
```

Destructor.

Automatically removes the element from any list it still might be enchainned in.

Definition at line [48](#) of file [hlist](#).

The documentation for this class was generated from the following file:

- [I4/cxx/hlist](#)

## 15.47 cxx::H\_list\_t< T > Struct Template Reference

Double-linked list of typed [H\\_list\\_item\\_t](#) elements.

```
#include <hlist>
```

Inheritance diagram for cxx::H\_list\_t< T >:

Collaboration diagram for `cxx::H_list_t< T >`:

#### Additional Inherited Members

#### Public Member Functions inherited from

**`cxx::H_list< T, Bits::Basic_list_policy< T, H_list_item_t< T > > >`**

- `void add (T *e)`

- *Add element to the front of the list.*

### 15.48.1 Detailed Description

`template<typename D, template< typename A > class Alloc = New_allocator>`  
`class cxx::List< D, Alloc >`

Doubly linked list, with internal allocation.

Container for items of type D, implemented by a doubly linked list. Alloc defines the allocator policy.

Definition at line 334 of file `list`.

### 15.48.2 Member Function Documentation

#### 15.48.2.1 `operator[]()` [1/2]

```
template<typename D , template< typename A > class Alloc = New_allocator>
D const & cxx::List< D, Alloc >::operator[] (
    unsigned long idx ) const [inline], [noexcept]
```

Random access.

Complexity is O(n).

Definition at line 404 of file `list`.

### 15.48.2.2 operator[]() [2/2]

```
template<typename D , template< typename A > class Alloc = New_allocator>
D & cxx::List< D, Alloc >::operator[] (
    unsigned long idx ) [inline], [noexcept]
```

Random access.

Complexity is O(n).

Definition at line 408 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

## 15.49 cxx::List< D, Alloc >::Iter Class Reference

Iterator.

```
#include <list>
```

Collaboration diagram for cxx::List< D, Alloc >::Iter:

### Public Member Functions

- **operator E\* ()** const noexcept  
*operator for testing validity (syntactically equal to pointers)*

### 15.49.1 Detailed Description

```
template<typename D, template< typename A > class Alloc = New_allocator>
class cxx::List< D, Alloc >::Iter
```

Iterator.

Forward and backward iterable.

Definition at line 354 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

## 15.50 `cxx::List_alloc` Class Reference

Standard list-based allocator.

```
#include <list_alloc>
```

Collaboration diagram for `cxx::List_alloc`:

### Public Member Functions

- [List\\_alloc\(\)](#)  
*Initializes an empty list allocator.*
- void [free](#) (void \*block, unsigned long size, bool initial\_free=false)  
*Return a free memory block to the allocator.*
- void \* [alloc](#) (unsigned long size, unsigned long align, unsigned long lower=0, unsigned long upper=~0UL)  
*Allocate a memory block.*
- void \* [alloc\\_max](#) (unsigned long min, unsigned long \*max, unsigned long align, unsigned granularity, unsigned long lower=0, unsigned long upper=~0UL)  
*Allocate a memory block of  $min \leq size \leq max$ .*
- unsigned long [avail](#) ()  
*Get the amount of available memory.*

### 15.50.1 Detailed Description

Standard list-based allocator.

Definition at line 32 of file [list\\_alloc](#).

### 15.50.2 Constructor & Destructor Documentation

#### 15.50.2.1 List\_alloc()

```
cxx::List_alloc::List_alloc ( ) [inline]
```

Initializes an empty list allocator.

#### Note

To initialize the allocator with available memory use the [free\(\)](#) function.

Definition at line 57 of file [list\\_alloc](#).

### 15.50.3 Member Function Documentation

#### 15.50.3.1 alloc()

```
void * cxx::List_alloc::alloc (
    unsigned long size,
    unsigned long align,
    unsigned long lower = 0,
    unsigned long upper = ~0UL ) [inline]
```

Allocate a memory block.

##### Parameters

<i>size</i>	Size of the memory block.
<i>align</i>	Alignment constraint.
<i>lower</i>	Lower bound of the physical region the memory block should be allocated from.
<i>upper</i>	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

##### Returns

Pointer to memory block

##### Precondition

$0 < \text{size} \leq \sim 0UL - 32$ .

Definition at line 400 of file [list\\_alloc](#).

#### 15.50.3.2 alloc\_max()

```
void * cxx::List_alloc::alloc_max (
    unsigned long min,
    unsigned long * max,
    unsigned long align,
    unsigned granularity,
    unsigned long lower = 0,
    unsigned long upper = ~0UL ) [inline]
```

Allocate a memory block of  $\text{min} \leq \text{size} \leq \text{max}$ .

##### Parameters

	<i>min</i>	Minimal size to allocate (in bytes).
<i>in, out</i>	<i>max</i>	Maximum size to allocate (in bytes). The actual allocated size is returned here.
	<i>align</i>	Alignment constraint.
	<i>granularity</i>	Granularity to use for the allocation (power of 2).
	<i>lower</i>	Lower bound of the physical region the memory block should be allocated from.
	<i>upper</i>	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

**Returns**

Pointer to memory block

**Precondition**

$0 < \text{min} \leq \sim 0\text{UL} - 32$ .

$0 < \text{max}$ .

Definition at line 280 of file [list\\_alloc](#).

References [l4\\_round\\_size\(\)](#), and [l4\\_trunc\\_size\(\)](#).

Here is the call graph for this function:

**15.50.3.3 avail()**

```
unsigned long cxx::List_alloc::avail ( ) [inline]
```

Get the amount of available memory.

**Returns**

Available memory in bytes

Definition at line 488 of file [list\\_alloc](#).

**15.50.3.4 free()**

```
void cxx::List_alloc::free (
    void * block,
    unsigned long size,
    bool initial_free = false ) [inline]
```

Return a free memory block to the allocator.

**Parameters**

<i>block</i>	Pointer to memory block.
<i>size</i>	Size of memory block.
<i>initial_free</i>	Set to true for putting fresh memory to the allocator. This will enforce alignment on that memory.

**Precondition**

`block` must not be NULL.

`2 * sizeof(void *) <= size <= ~0UL - 32.`

Definition at line 239 of file [list\\_alloc](#).

The documentation for this class was generated from the following file:

- `I4/cxx/list_alloc`

## 15.51 cxx::List\_item Class Reference

Basic list item.

```
#include <list>
```

Inherited by `cxx::T_list_item< T >`.

Collaboration diagram for `cxx::List_item`:

**Data Structures**

- class [Iter](#)  
*Iterator for a list of ListItem-s.*
- class [T\\_iter](#)  
*Iterator for derived classes from ListItem.*

## Public Member Functions

- [List\\_item](#) \* **get\_prev\_item** () const noexcept  
*Get previous item.*
- [List\\_item](#) \* **get\_next\_item** () const noexcept  
*Get next item.*
- void **insert\_prev\_item** ([List\\_item](#) \*p) noexcept  
*Insert item p before this item.*
- void **insert\_next\_item** ([List\\_item](#) \*p) noexcept  
*Insert item p after this item.*
- void **remove\_me** () noexcept  
*Remove this item from the list.*

## Static Public Member Functions

- template<typename C , typename N >  
static C \* **push\_back** (C \*head, N \*p) noexcept  
*Append item to a list.*
- template<typename C , typename N >  
static C \* **push\_front** (C \*head, N \*p) noexcept  
*Prepend item to a list.*
- template<typename C , typename N >  
static C \* **remove** (C \*head, N \*p) noexcept  
*Remove item from a list.*

### 15.51.1 Detailed Description

Basic list item.

Basic item that can be member of a doubly linked, cyclic list.

Definition at line 37 of file [list](#).

### 15.51.2 Member Function Documentation

#### 15.51.2.1 push\_back()

```
template<typename C , typename N >
C * cxx::List_item::push_back (
    C * head,
    N * p ) [inline], [static], [noexcept]
```

Append item to a list.

Convenience function for empty-head corner case.

#### Parameters

<i>head</i>	Pointer to the current list head.
<i>p</i>	Pointer to new item.

**Returns**

the pointer to the new head.

Definition at line 248 of file [list](#).

References [insert\\_prev\\_item\(\)](#).

Referenced by [cxx::List< D, Alloc >::push\\_back\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.51.2.2 push\_front()**

```

template<typename C , typename N >
C * cxx::List_item::push_front (
    C * head,
    N * p ) [inline], [static], [noexcept]
  
```

Prepend item to a list.

Convenience function for empty-head corner case.

**Parameters**

<i>head</i>	pointer to the current list head.
<i>p</i>	pointer to new item.

**Returns**

the pointer to the new head.

Definition at line 259 of file [list](#).

Referenced by [cxx::List< D, Alloc >::push\\_front\(\)](#).

Here is the caller graph for this function:

**15.51.2.3 remove()**

```

template<typename C , typename N >
C * cxx::List_item::remove (
    C * head,
    N * p ) [inline], [static], [noexcept]
  
```

Remove item from a list.

Convenience function for remove-head corner case.

**Parameters**

<i>head</i>	pointer to the current list head.
<i>p</i>	pointer to the item to remove.

**Returns**

the pointer to the new head.

Definition at line 269 of file [list](#).

Referenced by [cxx::List< D, Alloc >::remove\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

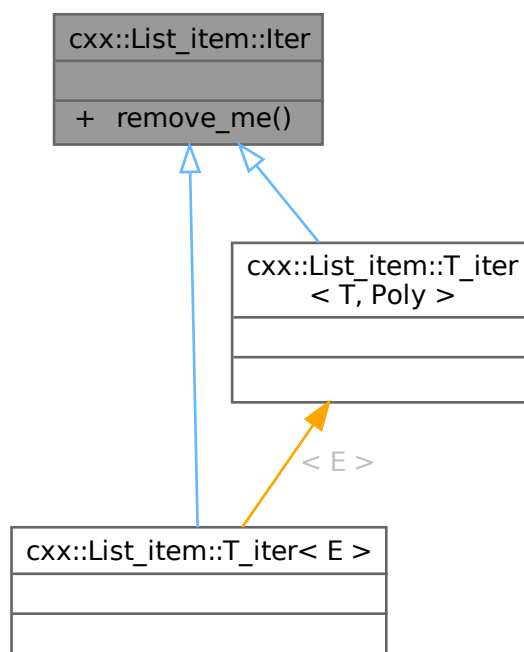

- l4/cxx/list

## 15.52 cxx::List\_item::Iter Class Reference

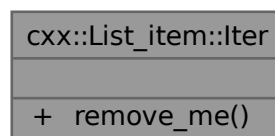

Iterator for a list of ListItem-s.

```
#include <list>
```

Inheritance diagram for cxx::List\_item::Iter:

Collaboration diagram for cxx::List\_item::Iter:

**Public Member Functions**

- [List\\_item](#) \* **remove\_me** () noexcept  
*Remove item pointed to by iterator, and return pointer to element.*

**15.52.1 Detailed Description**

Iterator for a list of ListItem-s.

The Iterator iterates till it finds the first element again.

Definition at line 45 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

**15.53 cxx::List\_item::T\_iter< T, Poly > Class Template Reference**

Iterator for derived classes from ListItem.

```
#include <list>
```

Inheritance diagram for cxx::List\_item::T\_iter< T, Poly >:

Collaboration diagram for `cxx::List_item::T_iter< T, Poly >`:

#### Additional Inherited Members

#### Public Member Functions inherited from `cxx::List_item::Iter`

- `List_item * remove_me ()` noexcept  
*Remove item pointed to by iterator, and return pointer to element.*

### 15.53.1 Detailed Description

```
template<typename T, bool Poly = false>
class cxx::List_item::T_iter< T, Poly >
```

Iterator for derived classes from `ListItem`.

Allows direct access to derived classes by `*` operator.

Example: `class Foo : public ListItem { public: typedef T_iter<Foo> Iter; ... };`

Definition at line 119 of file `list`.

The documentation for this class was generated from the following file:

- `I4/cxx/list`

## 15.54 cxx::Lt\_functor< Obj > Struct Template Reference

Generic comparator class that defaults to the less-than operator.

```
#include <std_ops>
```

Collaboration diagram for cxx::Lt\_functor< Obj >:

### 15.54.1 Detailed Description

```
template<typename Obj>
struct cxx::Lt_functor< Obj >
```

Generic comparator class that defaults to the less-than operator.

Definition at line 29 of file [std\\_ops](#).

The documentation for this struct was generated from the following file:

- I4/cxx/std\_ops

## 15.55 cxx::New\_allocator< \_Type > Class Template Reference

Standard allocator based on `operator new ()`.

```
#include <std_alloc>
```

Inheritance diagram for cxx::New\_allocator< \_Type >:

Collaboration diagram for `cxx::New_allocator<_Type>`:

### 15.55.1 Detailed Description

```
template<typename _Type>
class cxx::New_allocator<_Type>
```

Standard allocator based on `operator new ()`.

This allocator is the default allocator used for the *cxx Containers*, such as [cxx::Avl\\_set](#) and [cxx::Avl\\_map](#), to allocate the internal data structures.

Definition at line 67 of file [std\\_alloc](#).

The documentation for this class was generated from the following file:

- `I4/cxx/std_alloc`

## 15.56 cxx::Nothrow Class Reference

Helper type to distinguish the `oeprator new` version that does not throw exceptions.

```
#include <std_alloc>
```

Collaboration diagram for `cxx::Nothrow`:

### 15.56.1 Detailed Description

Helper type to distinguish the `operator new` version that does not throw exceptions.

Definition at line 30 of file [std\\_alloc](#).

The documentation for this class was generated from the following file:

- `I4/cxx/std_alloc`

## 15.57 `cxx::Pair< First, Second >` Struct Template Reference

[Pair](#) of two values.

```
#include <pair>
```

Collaboration diagram for `cxx::Pair< First, Second >`:

<code>cxx::Pair&lt; First, Second &gt;</code>	
+	<code>first</code>
+	<code>second</code>
+	<code>Pair()</code>
+	<code>Pair()</code>
+	<code>Pair()</code>

### Public Types

- typedef First **First\_type**  
*Type of first value.*
- typedef Second **Second\_type**  
*Type of second value.*

### Public Member Functions

- `template<typename A1 , typename A2 >`  
[Pair](#) (A1 &&[first](#), A2 &&[second](#))  
*Create a pair from the two values.*
- `template<typename A1 >`  
[Pair](#) (A1 &&[first](#))  
*Create a pair, default constructing the second value.*
- **Pair** ()=default  
*Default construction.*

## Data Fields

- First **first**  
*First value.*
- Second **second**  
*Second value.*

### 15.57.1 Detailed Description

```
template<typename First, typename Second>
struct cxx::Pair< First, Second >
```

[Pair](#) of two values.

Standard container for a pair of values.

#### Parameters

<i>First</i>	Type of the first value.
<i>Second</i>	Type of the second value.

Definition at line [38](#) of file [pair](#).

### 15.57.2 Constructor & Destructor Documentation

#### 15.57.2.1 [Pair\(\)](#) [1/2]

```
template<typename First , typename Second >
template<typename A1 , typename A2 >
cxx::Pair< First, Second >::Pair (
    A1 && first,
    A2 && second ) [inline]
```

Create a pair from the two values.

#### Parameters

<i>first</i>	The first value.
<i>second</i>	The second value.

Definition at line [56](#) of file [pair](#).

#### 15.57.2.2 [Pair\(\)](#) [2/2]

```
template<typename First , typename Second >
template<typename A1 >
cxx::Pair< First, Second >::Pair (
    A1 && first ) [inline]
```

Create a pair, default constructing the second value.

## Parameters

<i>first</i>	The first value.
--------------	------------------

Definition at line 64 of file [pair](#).

The documentation for this struct was generated from the following file:

- [l4/cxx/pair](#)

## 15.58 cxx::Pair\_first\_compare< Cmp, Typ > Class Template Reference

Comparison functor for [Pair](#).

```
#include <pair>
```

Collaboration diagram for cxx::Pair\_first\_compare< Cmp, Typ >:

### Public Member Functions

- [Pair\\_first\\_compare](#) (Cmp const &cmp=Cmp())  
*Construction.*
- bool [operator\(\)](#) (Typ const &l, Typ const &r) const  
*Do the comaprison based on the first value.*

### 15.58.1 Detailed Description

```
template<typename Cmp, typename Typ>
class cxx::Pair_first_compare< Cmp, Typ >
```

Comparison functor for [Pair](#).

## Parameters

<i>Cmp</i>	Comparison functor for the first value of the pair.
<i>Typ</i>	The pair type.

This functor can be used to compare [Pair](#) values with respect to the first value.

Definition at line [85](#) of file [pair](#).

## 15.58.2 Constructor & Destructor Documentation

### 15.58.2.1 `Pair_first_compare()`

```
template<typename Cmp , typename Typ >
cxx::Pair_first_compare< Cmp, Typ >::Pair_first_compare (
    Cmp const & cmp = Cmp() ) [inline]
```

Construction.

## Parameters

<i>cmp</i>	The comparison functor used for the first value.
------------	--

Definition at line [95](#) of file [pair](#).

## 15.58.3 Member Function Documentation

### 15.58.3.1 `operator>()()`

```
template<typename Cmp , typename Typ >
bool cxx::Pair_first_compare< Cmp, Typ >::operator() (
    Typ const & l,
    Typ const & r ) const [inline]
```

Do the comaprison based on the first value.

## Parameters

<i>l</i>	The lefthand value.
<i>r</i>	The righthand value.

Definition at line [102](#) of file [pair](#).

The documentation for this class was generated from the following file:

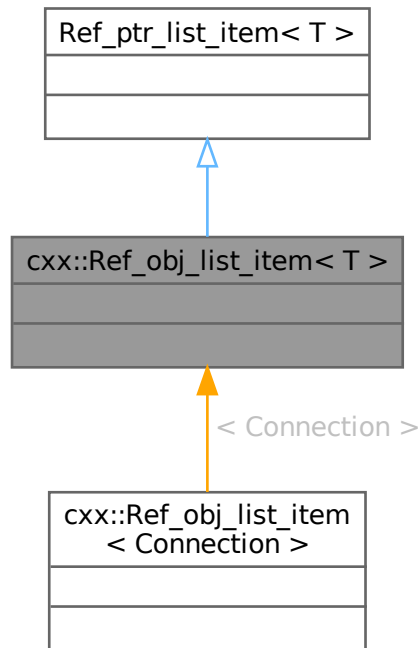

- [I4/cxx/pair](#)

## 15.59 cxx::Ref\_obj\_list\_item< T > Struct Template Reference

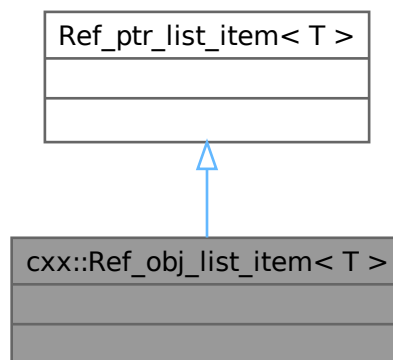

Item for list linked via [cxx::Ref\\_ptr](#) with default reference counting.

```
#include <ref_ptr_list>
```

Inheritance diagram for cxx::Ref\_obj\_list\_item< T >:

Collaboration diagram for cxx::Ref\_obj\_list\_item< T >:

### 15.59.1 Detailed Description

```
template<typename T>
struct cxx::Ref_obj_list_item< T >
```

Item for list linked via [cxx::Ref\\_ptr](#) with default reference counting.

Definition at line 27 of file [ref\\_ptr\\_list](#).

The documentation for this struct was generated from the following file:

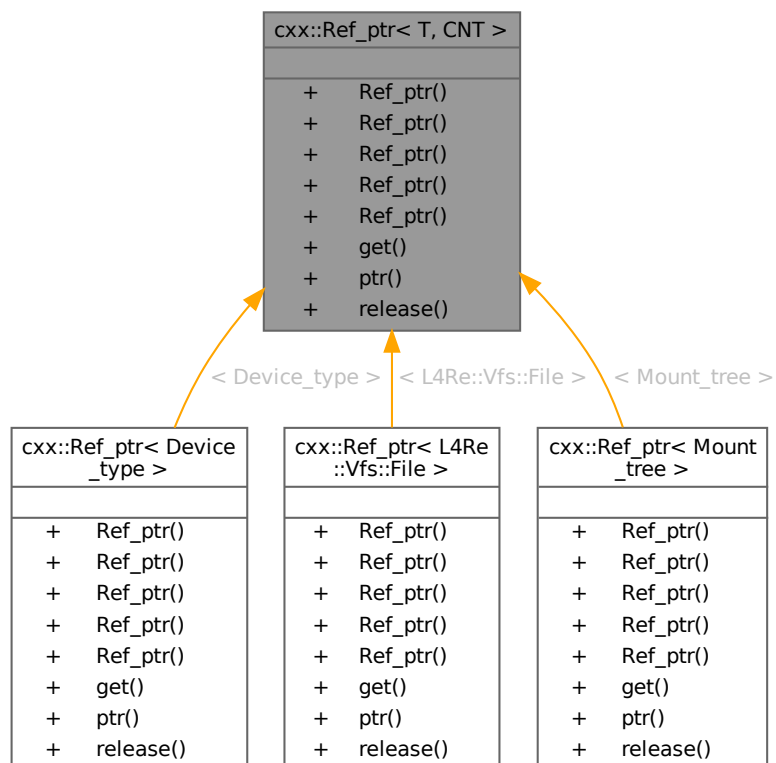

- [l4/cxx/ref\\_ptr\\_list](#)

## 15.60 cxx::Ref\_ptr< T, CNT > Class Template Reference

A reference-counting pointer with automatic cleanup.

```
#include <ref_ptr>
```

Inheritance diagram for cxx::Ref\_ptr< T, CNT >:

Collaboration diagram for `cxx::Ref_ptr< T, CNT >`:

<code>cxx::Ref_ptr&lt; T, CNT &gt;</code>	
+	<code>Ref_ptr()</code>
+	<code>Ref_ptr()</code>
+	<code>Ref_ptr()</code>
+	<code>Ref_ptr()</code>
+	<code>Ref_ptr()</code>
+	<code>get()</code>
+	<code>ptr()</code>
+	<code>release()</code>

## Public Member Functions

- **`Ref_ptr ()`** noexcept

*Create a shared pointer from a raw pointer without creating a new reference.*
- `T * get ()` const noexcept  
*Return a raw pointer to the object this shared pointer points to.*
- `T * ptr ()` const noexcept  
*Return a raw pointer to the object this shared pointer points to.*
- `T * release ()` noexcept  
*Release the shared pointer without removing the reference.*

### 15.60.1 Detailed Description

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
class cxx::Ref_ptr< T, CNT >
```

A reference-counting pointer with automatic cleanup.

## Template Parameters

<i>T</i>	Type of object the pointer points to.
<i>CNT</i>	Type of management class that manages the life time of the object.

This pointer is similar to the standard C++-11 `shared_ptr` but it does the reference counting directly in the object being pointed to, so that no additional management structures need to be allocated from the heap.

Classes that use this pointer type must implement two functions:

```
int remove_ref()
```

is called when a reference is removed and must return 0 when there are no further references to the object.

```
void add_ref()
```

is called when another `ref_ptr` to the object is created.

`Ref_obj` provides a simple implementation of this interface from which classes may inherit.

## Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 81 of file [ref\\_ptr](#).

## 15.60.2 Constructor &amp; Destructor Documentation

15.60.2.1 `Ref_ptr()` [1/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    Wp const & o ) [inline], [noexcept]
```

Create a shared pointer from a weak pointer.

Increases references.

Definition at line 99 of file [ref\\_ptr](#).

15.60.2.2 `Ref_ptr()` [2/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
template<typename X >
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    X * o ) [inline], [explicit], [noexcept]
```

Create a shared pointer from a raw pointer.

In contrast to C++11 `shared_ptr` it is safe to use this constructor multiple times and have the same reference counter.

Definition at line 112 of file [ref\\_ptr](#).

15.60.2.3 `Ref_ptr()` [3/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    T * o,
    bool d ) [inline], [noexcept]
```

Create a shared pointer from a raw pointer without creating a new reference.

**Parameters**

<i>o</i>	Pointer to the object.
<i>d</i>	Dummy parameter to select this constructor at compile time. The value may be true or false.

This is the counterpart to [release\(\)](#).

Definition at line [125](#) of file [ref\\_ptr](#).

### 15.60.3 Member Function Documentation

#### 15.60.3.1 `get()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::get ( ) const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line [132](#) of file [ref\\_ptr](#).

#### 15.60.3.2 `ptr()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::ptr ( ) const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line [138](#) of file [ref\\_ptr](#).

#### 15.60.3.3 `release()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::release ( ) [inline], [noexcept]
```

Release the shared pointer without removing the reference.

**Returns**

A raw pointer to the managed object.

Definition at line [149](#) of file [ref\\_ptr](#).

The documentation for this class was generated from the following file:

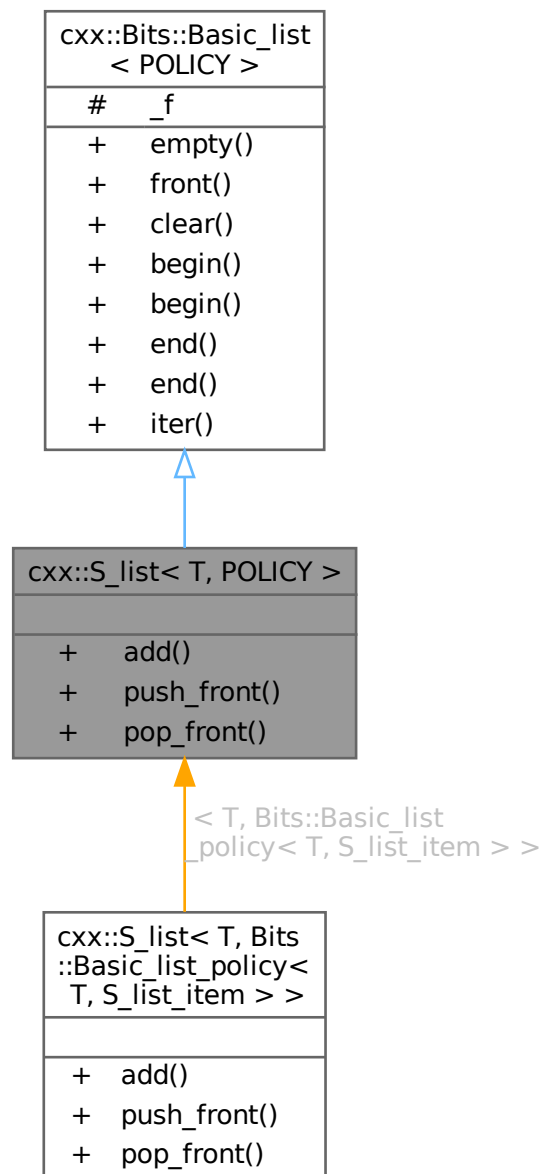

- `I4/cxx/ref_ptr`

## 15.61 cxx::S\_list< T, POLICY > Class Template Reference

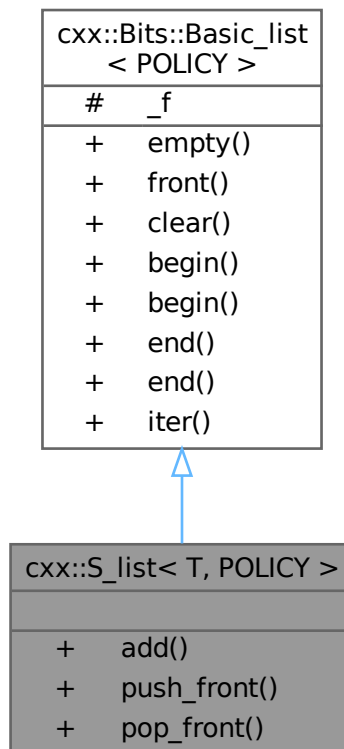

Simple single-linked list.

```
#include <slist>
```

Inheritance diagram for cxx::S\_list< T, POLICY >:

Collaboration diagram for `cxx::S_list< T, POLICY >`:

### Public Member Functions

- void **add** (T \*e)  
*Add an element to the front of the list.*
- void **push\_front** (T \*e)  
*Add an element to the front of the list.*
- T \* **pop\_front** ()  
*Remove and return the head element of the list.*

### Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- bool **empty** () const  
*Check if the list is empty.*
- Value\_type **front** () const  
*Return the first element in the list.*
- void **clear** ()  
*Remove all elements from the list.*
- Iterator **begin** ()  
*Return an iterator to the beginning of the list.*
- Const\_iterator **begin** () const

*Return a const iterator to the beginning of the list.*

- Const\_iterator **end** () const

*Return a const iterator to the end of the list.*

- Iterator **end** ()

*Return an iterator to the end of the list.*

## Additional Inherited Members

## Static Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- static Const\_iterator `iter` (Const\_value\_type c)

*Return a const iterator that begins at the given element.*

## Protected Attributes inherited from `cxx::Bits::Basic_list< POLICY >`

- POLICY::Head\_type \_f

*Pointer to front of the list.*

### 15.61.1 Detailed Description

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, S_list_item >>
class cxx::S_list< T, POLICY >
```

Simple single-linked list.

#### Template Parameters

<i>T</i>	Type of elements saved in the list. Must inherit from <code>cxx::S_list_item</code>
----------	---

Definition at line 51 of file `slist`.

### 15.61.2 Member Function Documentation

#### 15.61.2.1 `pop_front()`

```
template<typename T , typename POLICY = Bits::Basic_list_policy< T, S_list_item >>
T * cxx::S_list< T, POLICY >::pop_front ( ) [inline]
```

Remove and return the head element of the list.

**Precondition**

The list must not be empty or the behaviour will be undefined.

Definition at line 100 of file [slist](#).

References [cxx::Bits::Basic\\_list< POLICY >::\\_f](#), and [cxx::Bits::Basic\\_list< POLICY >::front\(\)](#).

*Type of the backend allocator.*

## 15.62.1 Detailed Description

`template<typename Type, int Slab\_size = L4\_PAGESIZE, int Max\_free = 2, template< typename A > class Alloc = New\_allocator>`

`class cxx::Slab< Type, Slab\_size, Max\_free, Alloc >`

`Slab` allocator for object of type `Type`.

### Template Parameters

<i>Type</i>	The type of the objects to manage.
<i>Slab_size</i>	Size of a slab.
<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

Definition at line [346](#) of file `slab\_alloc`.

## 15.62.2 Member Function Documentation

### 15.62.2.1 `alloc()`

```
template<typename Type , int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A
> class Alloc = New_allocator>
Type * cxx::Slab< Type, Slab_size, Max_free, Alloc >::alloc ( ) [inline], [noexcept]
```

Allocate an object of type `Type`.

#### Returns

A pointer to the object just allocated, or 0 on failure.

#### Note

The user is responsible for initializing the object.

Definition at line 366 of file `slab_alloc`.

### 15.62.2.2 `free()`

```
template<typename Type , int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A
> class Alloc = New_allocator>
void cxx::Slab< Type, Slab_size, Max_free, Alloc >::free (
    Type * o ) [inline], [noexcept]
```

Free the object addressed by `o`.

#### Parameters

<code>o</code>	The pointer to the object to free.
----------------	------------------------------------

#### Precondition

The object must have been allocated with this allocator.

Definition at line 377 of file `slab_alloc`.

References `cxx::Slab< Type, Slab_size, Max_free, Alloc >::free()`.

Referenced by `cxx::Slab< Type, Slab_size, Max_free, Alloc >::free()`.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- `I4/cxx/slab_alloc`

## 15.63 `cxx::Slab_static< Type, Slab_size, Max_free, Alloc > Class` Template Reference

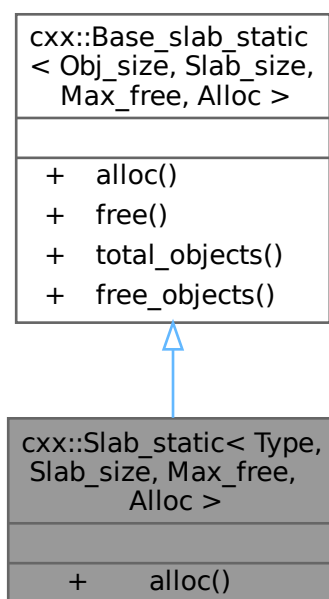

Merged slab allocator (allocators for objects of the same size are merged together).

```
#include <slab_alloc>
```

Inheritance diagram for cxx::Slab\_static< Type, Slab\_size, Max\_free, Alloc >:

Collaboration diagram for cxx::Slab\_static< Type, Slab\_size, Max\_free, Alloc >:

## Public Member Functions

- `Type * alloc () noexcept`  
*Allocate an object of type `Type`.*

## Public Member Functions inherited from

`cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >`

- `void * alloc () noexcept`  
*Allocate an object.*
- `void free (void *p) noexcept`  
*Free the given object (`p`).*
- `unsigned total_objects () const noexcept`  
*Get the total number of objects managed by the slab allocator.*
- `unsigned free_objects () const noexcept`  
*Get the number of free objects in the slab allocator.*

## Additional Inherited Members

## Public Types inherited from

`cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >`

- enum { `object_size` = `Obj_size` , `slab_size` = `Slab_size` , `objects_per_slab` = `_A::objects_per_slab` , `max_free_slabs` = `Max_free` }

## 15.63.1 Detailed Description

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class
Alloc = New_allocator>
class cxx::Slab_static< Type, Slab_size, Max_free, Alloc >
```

Merged slab allocator (allocators for objects of the same size are merged together).

### Template Parameters

<i>Type</i>	The type of the objects to manage.
<i>Slab_size</i>	The size of a slab.
<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `sizeof(Type)`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.

Definition at line 476 of file `slab_alloc`.

## 15.63.2 Member Function Documentation

### 15.63.2.1 `alloc()`

```
template<typename Type , int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A  
> class Alloc = New_allocator>
```

```
Type * cxx::Slab_static< Type, Slab_size, Max_free, Alloc >::alloc ( ) [inline], [noexcept]
```

Allocate an object of type `Type`.

#### Returns

A pointer to the just allocated object, or 0 on failure.

#### Note

The object is not zeroed out by the slab allocator.

Definition at line 489 of file `slab_alloc`.

References `cxx::Slab_static< Type, Slab_size, Max_free, Alloc >::alloc()`.

Referenced by `cxx::Slab_static< Type, Slab_size, Max_free, Alloc >::alloc()`.

*Inequality.*

### 15.65.1 Detailed Description

Allocation free string class with explicit length field.

This class is used to group characters of a string which belong to one syntactical token types number, identifier, string, whitespace or another single character.

Stings in this class can contain null bytes and may denote parts of other strings.

#### Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 41 of file [string](#).

## 15.65.2 Constructor & Destructor Documentation

### 15.65.2.1 String()

```
cxx::String::String (
    char const * s,
    char const * e ) [inline], [noexcept]
```

Initialize with start and end pointer.

#### Parameters

<i>s</i>	first character of the string
<i>e</i>	pointer to first byte behind the string

Definition at line 59 of file [string](#).

## 15.65.3 Member Function Documentation

### 15.65.3.1 find()

```
char const * cxx::String::find (
    char const * c,
    char const * s ) const [inline]
```

Find character set at position.

#### Parameters

<i>c</i>	zero-terminated string of characters to search for
<i>s</i>	start position of search in string

#### Return values

<a href="#">end()</a>	if no char in <i>c</i> is contained in string at or behind <i>s</i> .
<i>position</i>	in string of some character in <i>c</i> .

Definition at line 202 of file [string](#).

References [end\(\)](#), and [eof\(\)](#).

Here is the call graph for this function:

### 15.65.3.2 from\_dec()

```
template<typename INT >
int cxx::String::from_dec (
    INT * v ) const [inline]
```

Convert decimal string to integer.

#### Template Parameters

<i>INT</i>	result integer type
------------	---------------------

#### Parameters

out	v	conversion result
-----	---	-------------------

#### Returns

position of first character not converted.

Definition at line [239](#) of file [string](#).

References [eof\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

### 15.65.3.3 from\_hex()

```
template<typename INT >
int cxx::String::from_hex (
    INT * v ) const [inline]
```

Convert hex string to integer.

#### Template Parameters

<i>INT</i>	result integer type
------------	---------------------

#### Parameters

out	v	conversion result
-----	---	-------------------

#### Return values

-1	if the maximal amount of digits fitting into <i>INT</i> have been read,
<i>position</i>	of first character not converted otherwise.

Definition at line 268 of file [string](#).

References [eof\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

### 15.65.3.4 starts\_with()

```
Index cxx::String::starts_with (
    cxx::String const & c ) const [inline]
```

Check if *c* is a prefix of string.

**Returns**

0 if `c` is not a prefix, if it is a prefix, return first position not in `c` (which might be `end()`).

Definition at line 166 of file `string`.

References `start()`.

Here is the call graph for this function:

The documentation for this class was generated from the following file:

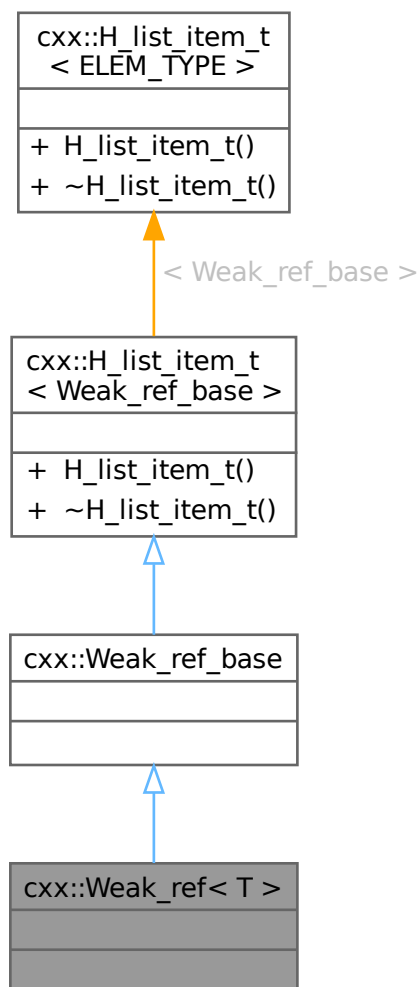

- `l4/cxx/string`

## 15.66 `cxx::Weak_ref< T >` Class Template Reference

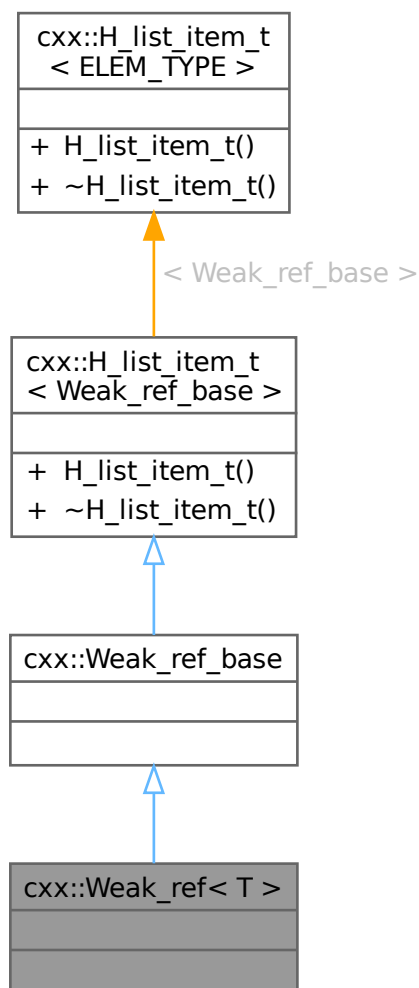

Typed weak reference to an object of type `T`.

```
#include <weak_ref>
```

Inheritance diagram for `cxx::Weak_ref< T >`:

Collaboration diagram for cxx::Weak\_ref< T >:

#### Additional Inherited Members

#### Public Member Functions inherited from `cxx::H_list_item_t< Weak_ref_base >`

- `H_list_item_t()`  
*Constructor.*
- `~H_list_item_t()` noexcept  
*Destructor.*

#### 15.66.1 Detailed Description

```
template<typename T>
class cxx::Weak_ref< T >
```

Typed weak reference to an object of type `T`.

## Template Parameters

<b><i>T</i></b>	The type of the referenced object.
-----------------	------------------------------------

A weak reference is a reference that is invalidated when the referenced object is about to be deleted. All weak references to an object are kept in a linked list (see [Weak\\_ref\\_base::List](#)) and all the weak references are iterated and reset by the [Weak\\_ref\\_base::List](#) destructor or `Weak_ref_base::List::reset()`.

The type `T` must provide two methods that handle the housekeeping of weak references: `remove_weak_ref(Weak_ref_base *)` and `add_weak_ref(Weak_ref_base *)`. These functions must handle the insertion and removal of the weak reference into the respective [Weak\\_ref\\_base::List](#) object. For convenience one can use the `cxx::Weak_ref_obj` as a base class that handles weak references for you.

For example:

```
class C : public cxx::Weak_ref_obj {};

int main()
{
    cxx::Weak_ref<C> r; // r is nullptr
    {
        C c;
        r = &c; // now r points to c
    } // c is destructed, which implies resetting all weak references to c
    // now r is nullptr
    return 0;
}
```

## Note

Weak references have no effect on the lifetime of the referenced object. Hence, a referenced object is *not* deleted when all weak references for it are gone. If automatic deletion is needed, see [cxx::Ref\\_ptr](#).

Definition at line 96 of file [weak\\_ref](#).

The documentation for this class was generated from the following file:

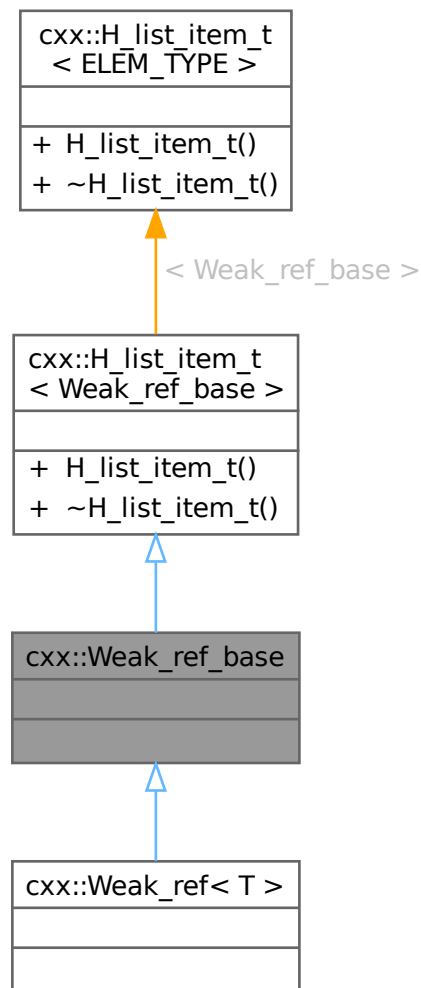

- `I4/cxx/weak_ref`

## 15.67 cxx::Weak\_ref\_base Class Reference

Generic (base) weak reference to some object.

```
#include <weak_ref>
```

Inheritance diagram for cxx::Weak\_ref\_base:

Collaboration diagram for `cxx::Weak_ref_base`:

## Data Structures

- struct [List](#)

*The list type for keeping all weak references to an object.*

## Additional Inherited Members

### Public Member Functions inherited from `cxx::H_list_item_t< Weak_ref_base >`

- [H\\_list\\_item\\_t\(\)](#)  
*Constructor.*
- [~H\\_list\\_item\\_t\(\)](#) noexcept  
*Destructor.*

### 15.67.1 Detailed Description

Generic (base) weak reference to some object.

A weak reference is a reference that gets reset to NULL when the object shall be deleted. All weak references to the same object are kept in a linked list of weak references.

For typed weak references see [cxx::Weak\\_ref](#).

Definition at line 25 of file [weak\\_ref](#).

The documentation for this class was generated from the following file:

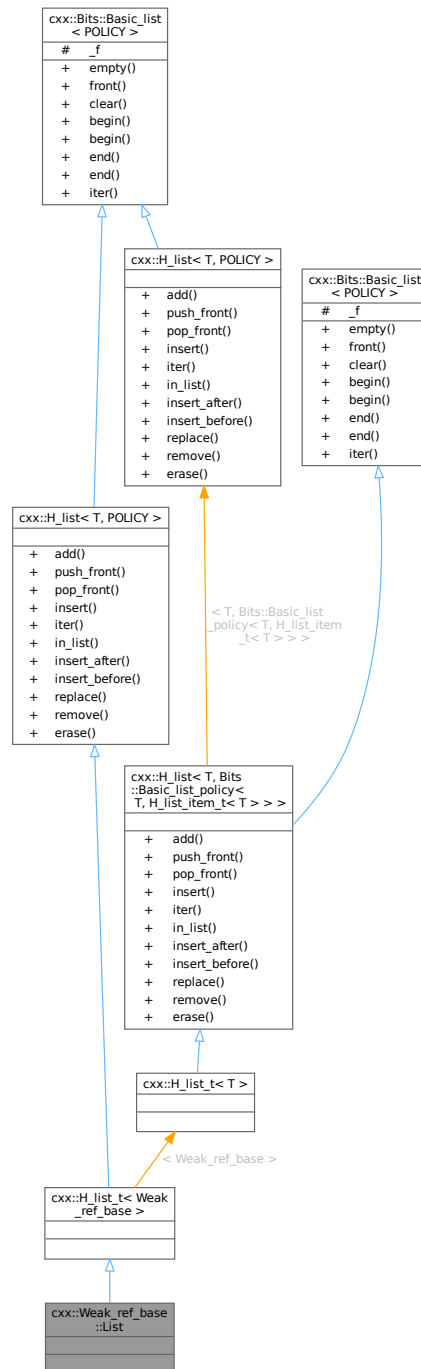

- `I4/cxx/weak_ref`

## 15.68 `cxx::Weak_ref_base::List` Struct Reference

The list type for keeping all weak references to an object.

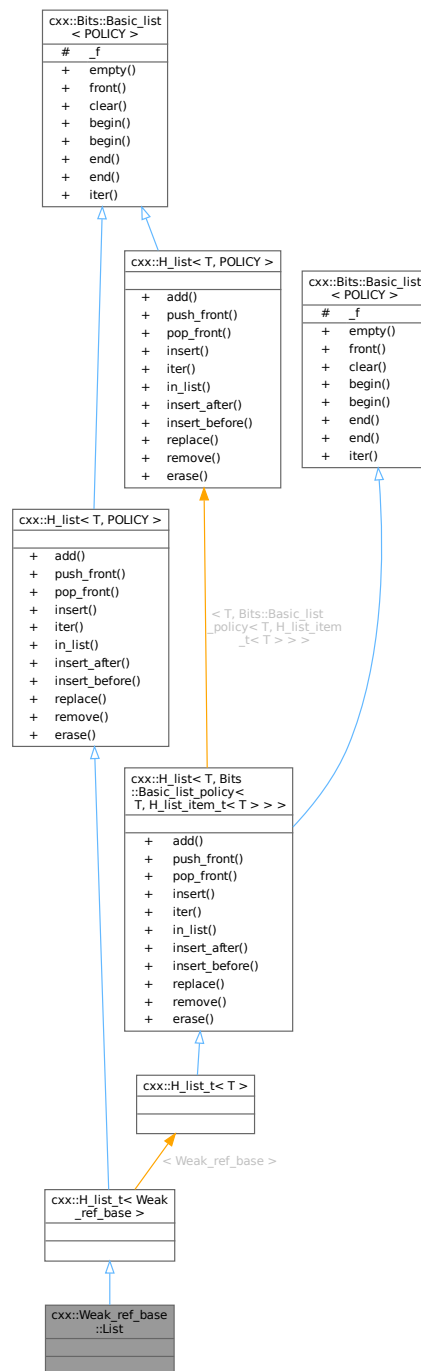

```
#include <weak_ref>
```

Inheritance diagram for `cxx::Weak_ref_base::List`:

Collaboration diagram for cxx::Weak\_ref\_base::List:

### Additional Inherited Members

### Public Member Functions inherited from **cxx::H\_list< T, POLICY >**

- void **add** (T \*e)  
Add element to the front of the list.

- void **push\_front** (T \*e)  
*Add element to the front of the list.*
- T \* **pop\_front** ()  
*Remove and return the head element of the list.*
- Iterator **insert** (T \*e, Iterator const &pred)  
*Insert an element at the iterator position.*

### Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- bool **empty** () const  
*Check if the list is empty.*
- Value\_type **front** () const  
*Return the first element in the list.*
- void **clear** ()  
*Remove all elements from the list.*
- Iterator **begin** ()  
*Return an iterator to the beginning of the list.*
- Const\_iterator **begin** () const  
*Return a const iterator to the beginning of the list.*
- Const\_iterator **end** () const  
*Return a const iterator to the end of the list.*
- Iterator **end** ()  
*Return an iterator to the end of the list.*

### Static Public Member Functions inherited from `cxx::H_list< T, POLICY >`

- static Iterator **iter** (T \*c)  
*Return an iterator for an arbitrary list element.*
- static bool **in\_list** (T const \*e)  
*Check if the given element is currently part of a list.*
- static Iterator **insert\_after** (T \*e, Iterator const &pred)  
*Insert an element after the iterator position.*
- static void **insert\_before** (T \*e, Iterator const &succ)  
*Insert an element before the iterator position.*
- static void **replace** (T \*p, T \*e)  
*Replace an element in a list with a new element.*
- static void **remove** (T \*e)  
*Remove the given element from its list.*
- static Iterator **erase** (Iterator const &e)  
*Remove the element at the given iterator position.*

### Static Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- static Const\_iterator **iter** (Const\_value\_type c)  
*Return a const iterator that begins at the given element.*

**Protected Attributes inherited from [cxx::Bits::Basic\\_list< POLICY >](#)**

- `POLICY::Head_type _f`  
*Pointer to front of the list.*

**15.68.1 Detailed Description**

The list type for keeping all weak references to an object.

On destrunction of a list, all weak references to the respective object are set to `nullptr`.

Definition at line 39 of file [weak\\_ref](#).

The documentation for this struct was generated from the following file:

- `I4/cxx/weak_ref`

**15.69 Elf32\_Auxv Struct Reference**

Auxiliary vector (32-bit).

```
#include <elf.h>
```

Collaboration diagram for Elf32\_Auxv:

**Data Fields**

- [Elf32\\_Word atype](#)

**15.69.1 Detailed Description**

Auxiliary vector (32-bit).

Definition at line 967 of file [elf.h](#).

## 15.69.2 Field Documentation

### 15.69.2.1 atype

[Elf32\\_Word](#) `Elf32_Auxv::atype`

See also

[Elf\\_ATs](#)

Definition at line [969](#) of file [elf.h](#).

The documentation for this struct was generated from the following file:

Definition at line 370 of file [elf.h](#).

#### 15.83.2.2 sh\_type

[Elf64\\_Word](#) Elf64\_Shdr::sh\_type

section's type

See also

[Elf\\_SHTs](#)

Definition at line 369 of file [elf.h](#).

The documentation for this struct was generated from the following file:

- [l4/util/elf.h](#)

## 15.84 Elf64\_Sym Struct Reference

ELF64 symbol table entry.

```
#include <elf.h>
```

Collaboration diagram for Elf64\_Sym:

Elf64_Sym
+ st_name
+ st_info
+ st_other
+ st_shndx
+ st_value
+ st_size

## Data Fields

- [Elf64\\_Word](#) **st\_name**  
*name of symbol (idx symstrtab)*
- unsigned char **st\_info**  
*type and binding info*
- unsigned char **st\_other**  
*undefined*
- [Elf64\\_Half](#) **st\_shndx**  
*associated section header*
- [Elf64\\_Addr](#) **st\_value**  
*value of associated symbol*
- [Elf64\\_Xword](#) **st\_size**  
*size of associated symbol*

### 15.84.1 Detailed Description

ELF64 symbol table entry.

Definition at line 887 of file [elf.h](#).

The documentation for this struct was generated from the following file:

- [l4/util/elf.h](#)

## 15.85 gfxbitmap\_offset Struct Reference

offsets in pmap[] and bmap[]

```
#include <bitmap.h>
```

Collaboration diagram for gfxbitmap\_offset:

## Data Fields

- [l4\\_uint32\\_t](#) **preskip\_x**  
*skip pixels at beginning of line*
- [l4\\_uint32\\_t](#) **preskip\_y**  
*skip lines*
- [l4\\_uint32\\_t](#) **endskip\_x**  
*skip pixels at end of line*

### 15.85.1 Detailed Description

offsets in `pmap[]` and `bmap[]`

Definition at line 67 of file [bitmap.h](#).

The documentation for this struct was generated from the following file:

- [l4/libgfxbitmap/bitmap.h](#)

## 15.86 L4::Alloc\_list Class Reference

A simple list-based allocator.

```
#include <alloc.h>
```

Collaboration diagram for L4::Alloc\_list:

### 15.86.1 Detailed Description

A simple list-based allocator.

Definition at line 31 of file [alloc.h](#).

The documentation for this class was generated from the following file:

- [l4/cxx/alloc.h](#)

## 15.87 L4::Arm\_smccc Class Reference

Wrapper for function calls that follow the ARM SMC/HVC calling convention.

```
#include <arm_smccc>
```

Inherits L4::Kobject\_0t< Derived, PROTO, S\_DEMAND >.

Collaboration diagram for L4::Arm\_smccc:

### Public Member Functions

- [l4\\_msgtag\\_t](#) [call](#) ([l4\\_umword\\_t](#) func, [l4\\_umword\\_t](#) in0, [l4\\_umword\\_t](#) in1, [l4\\_umword\\_t](#) in2, [l4\\_umword\\_t](#) in3, [l4\\_umword\\_t](#) in4, [l4\\_umword\\_t](#) in5, [l4\\_umword\\_t](#) \*out0, [l4\\_umword\\_t](#) \*out1, [l4\\_umword\\_t](#) \*out2, [l4\\_umword\\_t](#) \*out3, [l4\\_umword\\_t](#) client\_id)

*ARM SMC/HVC function call.*

### 15.87.1 Detailed Description

Wrapper for function calls that follow the ARM SMC/HVC calling convention.

See [l4\\_arm\\_smccc\\_call\(\)](#) for the corresponding C interface.

Definition at line 24 of file [arm\\_smccc](#).

### 15.87.2 Member Function Documentation

#### 15.87.2.1 call()

```

l4_msgtag_t L4::Arm_smccc::call (
    l4_umword_t func,
    l4_umword_t in0,
    l4_umword_t in1,
    l4_umword_t in2,
    l4_umword_t in3,
    l4_umword_t in4,
    l4_umword_t in5,
    l4_umword_t * out0,
    l4_umword_t * out1,
    l4_umword_t * out2,
    l4_umword_t * out3,
    l4_umword_t client_id )
  
```

ARM SMC/HVC function call.

The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.

## Parameters

	<i>func</i>	Function identifier. <ul style="list-style-type: none"> <li>• Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel.</li> <li>• Bit 30 defines the calling convention:</li> <li>• Bit 30 == 1: 64-bit calling convention.</li> <li>• Bit 30 == 0: 32-bit calling convention.</li> <li>• Bits 24..29 determine the service call ID. Only service IDs <math>\geq 0x30000000</math> (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed.</li> </ul>
in	<i>in0</i>	First input parameter.
in	<i>in1</i>	Second input parameter.
in	<i>in2</i>	Third input parameter.
in	<i>in3</i>	Fourth input parameter.
in	<i>in4</i>	Fifth input parameter.
in	<i>in5</i>	Sixth input parameter.
out	<i>out0</i>	First output parameter.
out	<i>out1</i>	Second output parameter.
out	<i>out2</i>	Third output parameter.
out	<i>out3</i>	Fourth output parameter.
in	<i>client_id</i>	Client ID. According to the specification, this value might be ignored by certain functions.

## Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID $< 0x30000000$ .
-L4_EINVAL	Invalid number of parameters.
$< 0$	Other L4 error.
0	Success.

The documentation for this class was generated from the following file:

- l4/sys/arm\_smccc

## 15.88 L4::Base\_exception Class Reference

Base class for all exceptions, thrown by the L4Re framework.

```
#include <l4/cxx/exceptions>
```

Inheritance diagram for L4::Base\_exception:

Collaboration diagram for L4::Base\_exception:

## Public Member Functions

- virtual char const \* **str** () const noexcept=0

*Return a human readable string for the exception.*

- virtual `~Base_exception ()` noexcept

*Destruction.*

### Public Member Functions inherited from [L4::Exception\\_tracer](#)

- void const \*const \* `pc_array ()` const noexcept

*Get the array containing the call trace.*

- int `frame_count ()` const noexcept

*Get the number of entries that are valid in the call trace.*

### Protected Member Functions

- `Base_exception ()` noexcept

*Create a base exception.*

### Protected Member Functions inherited from [L4::Exception\\_tracer](#)

- `Exception_tracer ()` noexcept

*Create a back trace.*

## 15.88.1 Detailed Description

Base class for all exceptions, thrown by the [L4Re](#) framework.

This is the abstract base of all exceptions thrown within the [L4Re](#) framework. It is basically also a good idea to use it as base of all user defined exceptions.

Definition at line [116](#) of file [exceptions](#).

The documentation for this class was generated from the following file:

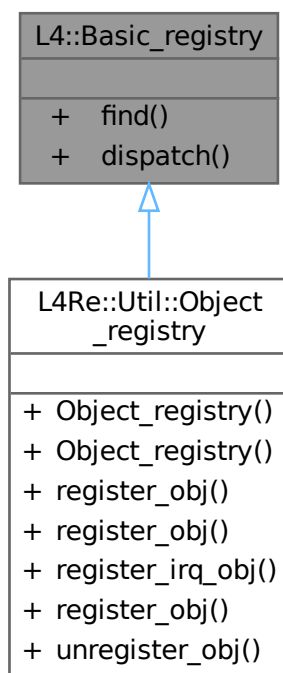

- [l4/cxx/exceptions](#)

## 15.89 L4::Basic\_registry Class Reference

This registry returns the corresponding server object based on the label of an [lpc\\_gate](#).

```
#include <ipc_epiface>
```

Inheritance diagram for L4::Basic\_registry:

Collaboration diagram for L4::Basic\_registry:

## Static Public Member Functions

- static [Value](#) \* [find](#) ([l4\\_umword\\_t](#) label)  
*Get the server object for an [lpc\\_gate](#) label.*
- static [l4\\_msgtag\\_t](#) [dispatch](#) ([l4\\_msgtag\\_t](#) tag, [l4\\_umword\\_t](#) label, [l4\\_utcb\\_t](#) \*utcb)  
*The dispatch function called by the server loop.*

### 15.89.1 Detailed Description

This registry returns the corresponding server object based on the label of an [lpc\\_gate](#).

Definition at line [540](#) of file [ipc\\_epiface](#).

### 15.89.2 Member Function Documentation

#### 15.89.2.1 [dispatch\(\)](#)

```
static l4\_msgtag\_t L4::Basic_registry::dispatch (
    l4\_msgtag\_t tag,
    l4\_umword\_t label,
    l4\_utcb\_t * utcb ) [inline], [static]
```

The dispatch function called by the server loop.

This function forwards the message to the server object identified by the given *label*.

#### Parameters

<i>tag</i>	The message tag used for the invocation.
<i>label</i>	The label used to find the object including the rights bits of the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Returns

The return code from the object's dispatch function or `-L4_ENOENT` if the object does not exist.

Definition at line [565](#) of file [ipc\\_epiface](#).

References [L4::Epiface::dispatch\(\)](#), and [find\(\)](#).

Here is the call graph for this function:

### 15.89.2.2 find()

```
static Value * L4::Basic_registry::find (
    l4_umword_t label ) [inline], [static]
```

Get the server object for an `lpc_gate` label.

#### Parameters

<i>label</i>	The label usually stored in an <code>lpc_gate</code> .
--------------	--

#### Returns

A pointer to the `Epiface` identified by the given label.

Definition at line 549 of file `ipc_epiface`.

Referenced by `dispatch()`.

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

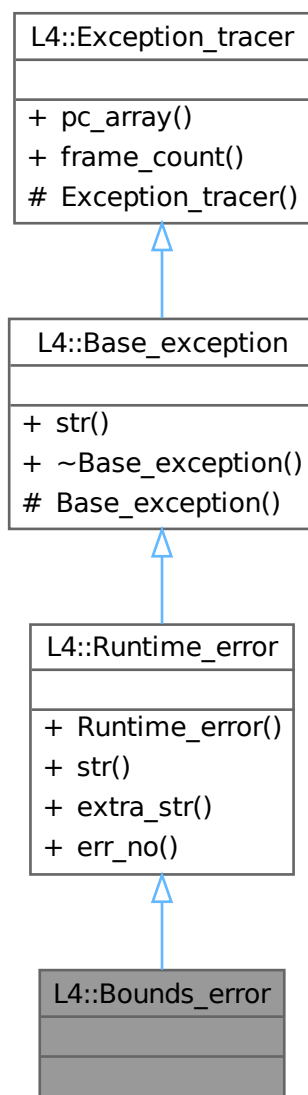

- `l4/sys/cxx/ipc_epiface`

## 15.90 L4::Bounds\_error Class Reference

Access out of bounds.

```
#include <exceptions>
```

Inheritance diagram for L4::Bounds\_error:

Collaboration diagram for L4::Bounds\_error:

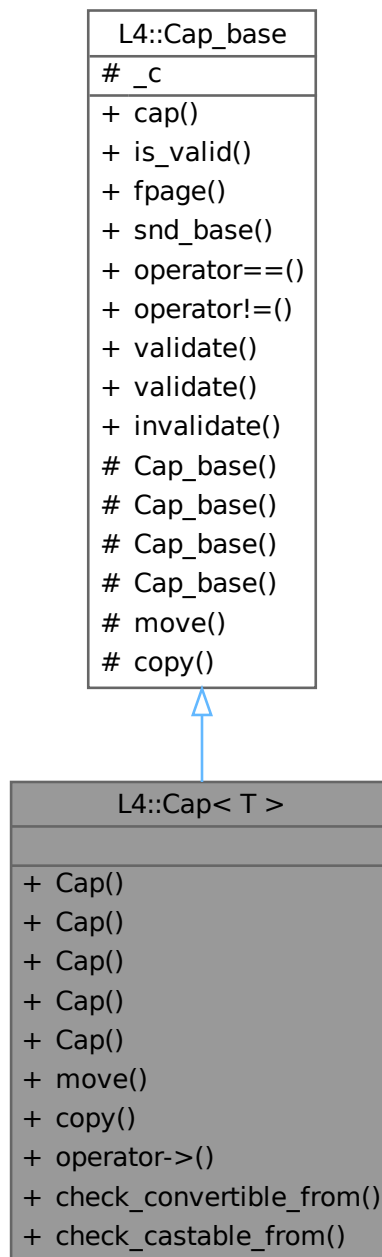

### Additional Inherited Members

### Public Member Functions inherited from [L4::Runtime\\_error](#)

- [Runtime\\_error](#) (long [err\\_no](#), char const \*extra=0) noexcept  
Create a new [Runtime\\_error](#).
- char const \* [str](#) () const noexcept override  
Return a human readable string for the exception.
- char const \* [extra\\_str](#) () const  
Get the description text for this runtime error.
- long [err\\_no](#) () const noexcept  
Get the error value for this runtime error.

## 15.91.1 Detailed Description

```
template<typename T>
class L4::Cap< T >
```

C++ interface for capabilities.

#### Template Parameters

<a href="#">T</a>	Type of the object the capability points to.
-------------------	--

The C++ version of a capability is comparable to a pointer, in fact it is a kind of smart pointer for our kernel objects and the objects derived from the kernel objects ([L4::Kobject](#)).

Add

```
#include <l4/sys/capability>
```

to your code to use the capability interface.

#### Examples

[examples/clntsrv/client.cc](#), [examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), [examples/libs/l4re/streammap/client.cc](#), and [examples/sys/migrate/thread\\_migrate](#)

Definition at line 218 of file [capability.h](#).

## 15.91.2 Constructor & Destructor Documentation

### 15.91.2.1 Cap() [1/4]

```
template<typename T >
template<typename O >
L4::Cap< T >::Cap (
    Cap< O > const & o ) [inline], [noexcept]
```

Create a copy from `o`, supporting implicit type casting.

#### Parameters

<code>o</code>	The source selector that shall be copied (and casted).
----------------	--

Definition at line 270 of file [capability.h](#).

### 15.91.2.2 Cap() [2/4]

```
template<typename T >
L4::Cap< T >::Cap (
    Cap_type cap ) [inline], [noexcept]
```

Constructor to create an invalid capability selector.

#### Parameters

<code>cap</code>	Capability selector.
------------------	----------------------

Definition at line 277 of file [capability.h](#).

### 15.91.2.3 Cap() [3/4]

```
template<typename T >
L4::Cap< T >::Cap (
    l4_default_caps_t cap ) [inline], [noexcept]
```

Initialize capability with one of the default capability selectors.

## Parameters

<i>cap</i>	Capability selector.
------------	----------------------

Definition at line 283 of file [capability.h](#).

**15.91.2.4 Cap()** [4/4]

```
template<typename T >
L4::Cap< T >::Cap (
    l4_cap_idx_t idx = L4_INVALID_CAP ) [inline], [explicit], [noexcept]
```

Initialize capability, defaults to the invalid capability selector.

## Parameters

<i>idx</i>	Capability selector.
------------	----------------------

Definition at line 289 of file [capability.h](#).

**15.91.3 Member Function Documentation****15.91.3.1 check\_castable\_from()**

```
template<typename T >
template<typename From >
static void L4::Cap< T >::check_castable_from ( ) [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From to be castable (via the correct `cap_cast`) to one of type T.

## Template Parameters

<i>From</i>	Type to convert from
-------------	----------------------

Definition at line 259 of file [capability.h](#).

**15.91.3.2 check\_convertible\_from()**

```
template<typename T >
template<typename From >
static void L4::Cap< T >::check_convertible_from ( ) [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From to be convertible to one of type T.

## Template Parameters

<i>From</i>	Type to convert from
-------------	----------------------

Definition at line 246 of file [capability.h](#).

**15.91.3.3 copy()**

```
template<typename T >
Cap L4::Cap< T >::copy (
    Cap< T > const & src ) const [inline]
```

Copy a capability to this cap slot.

## Parameters

<i>src</i>	the source capability slot.
------------	-----------------------------

Definition at line 312 of file [capability.h](#).

**15.91.3.4 move()**

```
template<typename T >
Cap L4::Cap< T >::move (
    Cap< T > const & src ) const [inline]
```

Move a capability to this cap slot.

## Parameters

<i>src</i>	the source capability slot.
------------	-----------------------------

After this operation the source slot is no longer valid.

Definition at line 302 of file [capability.h](#).

The documentation for this class was generated from the following file:

- l4/sys/cxx/capability.h

**15.92 L4::Cap\_base Class Reference**

Base class for all kinds of capabilities.

### 15.92.1 Detailed Description

Base class for all kinds of capabilities.

#### Attention

This class is not for direct use, use [L4::Cap](#) instead.

This class contains all the things that are independent of the type of the object referred by the capability.

#### See also

[L4::Cap](#) for typed capabilities.

Definition at line 25 of file [capability.h](#).

## 15.92.2 Member Enumeration Documentation

### 15.92.2.1 Cap\_type

enum [L4::Cap\\_base::Cap\\_type](#)

Invalid capability type.

Enumerator

Invalid	Invalid capability selector.
---------	------------------------------

Definition at line 40 of file [capability.h](#).

### 15.92.2.2 No\_init\_type

enum [L4::Cap\\_base::No\\_init\\_type](#)

Special value for uninitialized capability objects.

Enumerator

No_init	Special value for constructing uninitialized <a href="#">Cap</a> objects.
---------	---

Definition at line 29 of file [capability.h](#).

## 15.92.3 Constructor & Destructor Documentation

### 15.92.3.1 Cap\_base() [1/2]

```
L4::Cap_base::Cap_base (
    l4\_cap\_idx\_t c ) [inline], [explicit], [protected], [noexcept]
```

Generate a capability from its C representation.

Parameters

c	The C capability
---	------------------

Definition at line 144 of file [capability.h](#).

### 15.92.3.2 Cap\_base() [2/2]

```
L4::Cap_base::Cap_base (
    l4\_default\_caps\_t cap ) [inline], [explicit], [protected], [noexcept]
```

Initialize capability with one of the default capabilities.

## Parameters

<i>cap</i>	Capability.
------------	-------------

Definition at line 155 of file [capability.h](#).

## 15.92.4 Member Function Documentation

### 15.92.4.1 `cap()`

```
l4_cap_idx_t L4::Cap_base::cap ( ) const [inline], [noexcept]
```

Return capability selector.

## Returns

Capability selector.

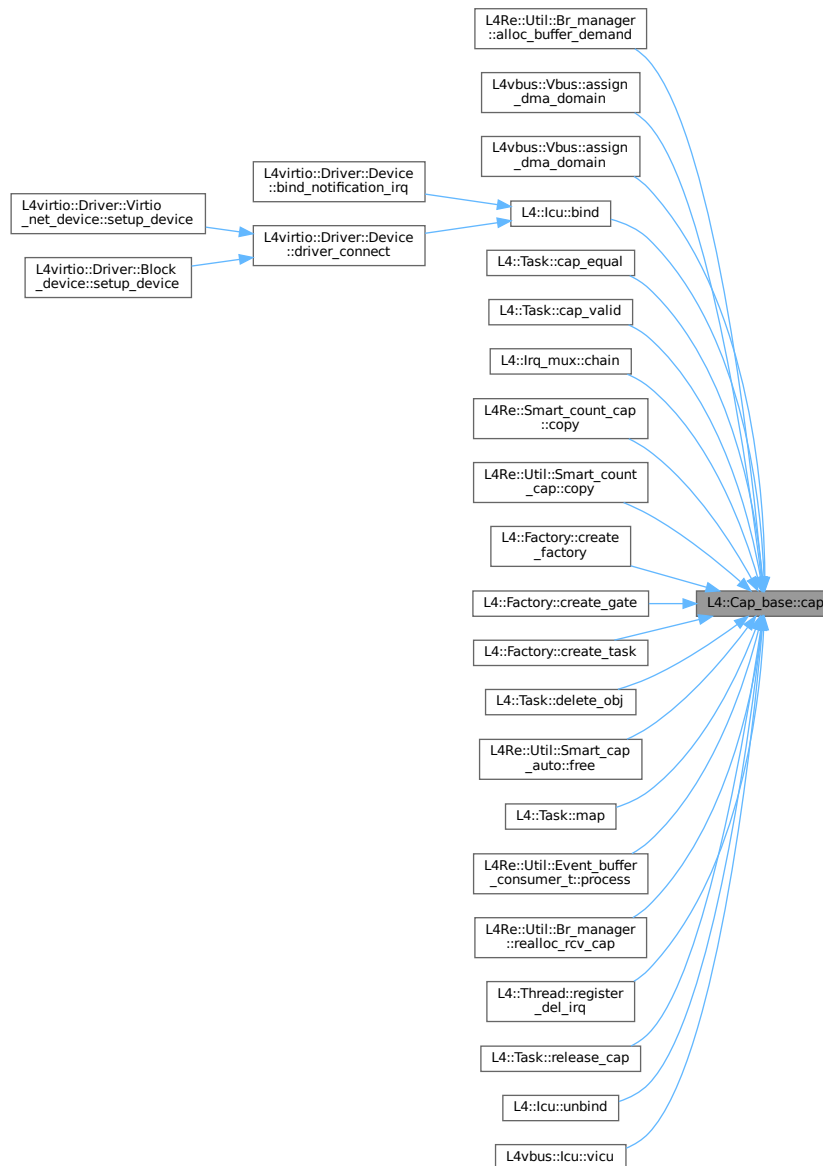

## Examples

[examples/libs/l4re/streammap/client.cc](#).

Definition at line 49 of file [capability.h](#).

Referenced by [L4Re::Util::Br\\_manager::alloc\\_buffer\\_demand\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4::lcu::bind\(\)](#), [L4::Task::cap\\_equal\(\)](#), [L4::Task::cap\\_valid\(\)](#), [L4::lrc\\_mux::chain\(\)](#), [L4Re::Smart\\_count\\_cap< Unmap\\_flags >::copy\(\)](#), [L4Re::Util::Smart\\_count\\_cap< Unmap\\_flags >::copy\(\)](#), [L4::Factory::create\\_factory\(\)](#), [L4::Factory::create\\_gate\(\)](#), [L4::Factory::create\\_task\(\)](#), [L4::Task::delete\\_obj\(\)](#), [L4Re::Util::Smart\\_cap\\_auto< Unmap\\_flags >::free\(\)](#), [L4::Task::map\(\)](#), [L4Re::Util::Event\\_buffer\\_consumer\\_t< PAYLOAD >::process\(\)](#), [L4Re::Util::Br\\_manager::realloc\\_rcv\\_cap\(\)](#), [L4::Thread::register\\_del\\_irq\(\)](#), [L4::Task::release\\_cap\(\)](#), [L4::lcu::unbind\(\)](#), and [L4vbus::lcu::vicu\(\)](#).

Here is the caller graph for this function:

### 15.92.4.2 copy()

```
void L4::Cap_base::copy (
    Cap_base const & src ) const [inline], [protected]
```

Copy a capability.

#### Parameters

src	the source capability.
-----	------------------------

After this operation this capability refers to the same object as `src`.

Definition at line 187 of file [capability.h](#).

References [fpage\(\)](#), [is\\_valid\(\)](#), [L4\\_BASE\\_TASK\\_CAP](#), [L4\\_CAP\\_FPAGE\\_RWSD](#), [L4\\_FPAGE\\_C\\_OBJ\\_RIGHTS](#), and [l4\\_task\\_map\(\)](#).

Here is the call graph for this function:

#### 15.92.4.3 fpage()

```
l4_fpage_t L4::Cap_base::fpage (
    unsigned rights = L4_CAP_FPAGE_RWS ) const [inline], [noexcept]
```

Return flex-page for the capability.

##### Parameters

<i>rights</i>	Rights, defaults to 'rws'
---------------	---------------------------

##### Returns

flex-page

Definition at line 69 of file [capability.h](#).

References [l4\\_obj\\_fpage\(\)](#).

Referenced by [copy\(\)](#), and [move\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.92.4.4 is\_valid()

```
bool L4::Cap_base::is_valid ( ) const [inline], [noexcept]
```

Test whether the capability is a valid capability index (i.e., not `L4_INVALID_CAP`).

##### Returns

True if capability is not invalid, false if invalid

##### Examples

[examples/clntsrv/client.cc](#), [examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#),  
and [examples/libs/l4re/streammap/client.cc](#).

Here is the caller graph for this function:

#### 15.92.4.5 move()

```
void L4::Cap_base::move (
    Cap_base const & src ) const [inline], [protected]
```

Replace this capability with the contents of `src`.

##### Parameters

<code>src</code>	the source capability.
------------------	------------------------

After the operation this capability refers to the object formerly referred to by the source capability `src`, and the source capability no longer refers to an object.

Definition at line 171 of file [capability.h](#).

References [fpage\(\)](#), [is\\_valid\(\)](#), [L4\\_BASE\\_TASK\\_CAP](#), [L4\\_CAP\\_FPAGE\\_RWSD](#), [L4\\_FPAGE\\_C\\_OBJ\\_RIGHTS](#), [L4\\_MAP\\_ITEM\\_GRANT](#), and [l4\\_task\\_map\(\)](#).

Here is the call graph for this function:

#### 15.92.4.6 `snd_base()`

```

l4_umword_t L4::Cap_base::snd_base (
    unsigned grant = L4_MAP_ITEM_MAP,
    l4_cap_idx_t base = L4_INVALID_CAP ) const [inline], [noexcept]
  
```

Return send base.

##### Parameters

<i>grant</i>	Indicates if object shall be granted. Allowed values: <a href="#">L4_MAP_ITEM_MAP</a> , <a href="#">L4_MAP_ITEM_GRANT</a> .
<i>base</i>	Base capability (first in a bundle of aligned capabilities)

##### Returns

Map object.

Definition at line 81 of file [capability.h](#).

References [L4\\_INVALID\\_CAP](#), and [l4\\_map\\_obj\\_control\(\)](#).

Here is the call graph for this function:

**15.92.4.7 validate()** [1/2]

```
l4_msgtag_t L4::Cap_base::validate (
    Cap< Task > task,
    l4_utcb_t * u = l4_utcb() ) const [inline], [noexcept]
```

Check whether a capability is present (refers to an object).

**Parameters**

<i>task</i>	<a href="#">Task</a> to check the capability in.
<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Return values**

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object or invalid capability slot).

A capability is considered present when it refers to an existing kernel object.

Definition at line 84 of file [capability](#).

References [l4\\_msgtag\(\)](#).

Here is the call graph for this function:

**15.92.4.8 validate()** [2/2]

```
l4_msgtag_t L4::Cap_base::validate (
    l4_utcb_t * u = l4_utcb() ) const [inline], [noexcept]
```

Check whether a capability is present (refers to an object).

**Parameters**

<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
----------	--

**Return values**

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
---------------------------------	--

## Return values

<code>l4_msgtag_t::label() == 0</code>	No capability present (void object or invalid capability slot).
--	---

A capability is considered present when it refers to an existing kernel object.

Definition at line 91 of file [capability](#).

References [L4\\_BASE\\_TASK\\_CAP](#), and [l4\\_msgtag\(\)](#).

Here is the call graph for this function:

## 15.94.1 Detailed Description

C++ kernel debugger API.

### Attention

This API is subject to change! Do not rely on it in production code.

This API is to be used for debugging exclusively.

This is the API for accessing kernel-debugger functionality from user-level programs. Specifically, it provides functionality to enrich the kernel debugger with insights into the program. The purpose is to facilitate debugging with the kernel debugger. For instance, a developer might choose to name the threads of her program so that she can find them in the kernel debugger thread list.

This API interacts with a kernel object that interfaces with the kernel debugger, the `jdb-kernel` object. The `jdb-kernel` object is fix and only available when the kernel debugger is built into the microkernel. The developer needs to pass the capability through to her program.

### Include File

```
#include <l4/sys/debugger>
```

Definition at line 53 of file [debugger](#).

## 15.94.2 Member Function Documentation

### 15.94.2.1 `add_image_info()`

```
l4_msgtag_t L4::Debugger::add_image_info (
    l4_addr_t base,
    const char * name,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Add loaded image information for a task.

### Parameters

<i>base</i>	Image load base address
<i>name</i>	Image name
<i>utcb</i>	The UTCB to use for the operation.

### Returns

System call return tag.

Definition at line 172 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.2 get\_object\_name()

```

l4_msgtag_t L4::Debugger::get_object_name (
    unsigned id,
    char * name,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Get name of object with Id `id`.

#### Parameters

	<i>id</i>	Id of the object whose name is asked.
out	<i>name</i>	Buffer to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <code>name</code> buffer.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Definition at line [159](#) of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.3 global\_id()

```

unsigned long L4::Debugger::global_id (
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Get the globally unique ID of the object behind a capability.

## Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

## Return values

$\sim 0UL$	The capability is invalid.
$\geq 0$	The global debugger id.

Definition at line 82 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

#### 15.94.2.4 kobj\_to\_id()

```

unsigned long L4::Debugger::kobj_to_id (
    l4_addr_t kobjp,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Get the globally unique ID of the object behind the kobject pointer.

## Parameters

<i>kobjp</i>	<a href="#">Kobject</a> pointer
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Return values

$\sim 0UL$	The capability or the <a href="#">Kobject</a> pointer are invalid.
$\geq 0$	The globally unique id.

Definition at line 94 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.5 query\_log\_name()

```

long L4::Debugger::query_log_name (
    unsigned idx,
    char * name,
    unsigned namelen,
    char * shortname,
    unsigned shortnamelen,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Query the name of a log type given the ID.

#### Parameters

	<i>idx</i>	ID to query.
out	<i>name</i>	Buffer to copy name to. The buffer must be allocated by the caller.
	<i>namelen</i>	Buffer length of name.
out	<i>shortname</i>	Buffer to copy <i>shortname</i> to. The buffer must be allocated by the caller.
	<i>shortnamelen</i>	Buffer length of <i>shortname</i> .
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

0	Success
<0	Error

Definition at line 127 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.6 query\_log\_typeid()

```

long L4::Debugger::query_log_typeid (
    const char * name,
    unsigned idx,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Query the log-id for a log type.

#### Parameters

<i>name</i>	Name to query for.
<i>idx</i>	Idx to start searching, start with 0
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

$\geq 0$	Id
$< 0$	Error

Definition at line [108](#) of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.7 set\_object\_name()

```
l4_msgtag_t L4::Debugger::set_object_name (
    const char * name,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Set the name of a kernel object.

#### Parameters

<i>name</i>	Name
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

System call return tag.

Definition at line 70 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.94.2.8 switch\_log()

```
l4_msgtag_t L4::Debugger::switch_log (
    const char * name,
    unsigned on_off,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Set or unset log.

#### Parameters

<i>name</i>	Name of the log type.
<i>on_off</i>	1: turn log on, 0: turn log off
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Definition at line 144 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

*Deprecated server registration function.*

### 15.97.1 Detailed Description

Base class for interface implementations.

An [Epiface](#) is the base interface of objects registered in the server loop. Incoming IPC gets dispatched to the appropriate [Epiface](#) object where the call is then handled appropriately.

#### Note

[Server](#) loops are allowed to internally keep raw pointers to [Epiface](#) objects for dispatching calls. Instances must therefore never be copied or moved.

Definition at line 156 of file [ipc\\_epiface](#).

### 15.97.2 Member Function Documentation

#### 15.97.2.1 dispatch()

```
virtual l4_msgtag_t L4::Epiface::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb ) [pure virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt;0</code>	Error, reply with error code.
<code>&gt;=0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implemented in [L4::Epiface\\_t< Block\\_dev< Ds\\_data >, L4virtio::Device >, L4::Epiface\\_t< Null\\_handler, L4::Kobject >, L4::Epiface\\_t< Virtio\\_client< DEV >, L4virtio::Device >, L4::Epiface\\_t< Derived, IFACE, BASE, bool >, L4::Server\\_object, L4::lrqep\\_t< Host\\_irq >, L4::lrqep\\_t< Irq\\_object >, and L4::lrqep\\_t< Derived, BASE, bool >](#).

Referenced by [L4::Basic\\_registry::dispatch\(\)](#).

Here is the caller graph for this function:

### 15.97.2.2 get\_buffer\_demand()

```
virtual Demand L4::Epiface::get_buffer_demand ( ) const [pure virtual]
```

Get the server-side receive buffer demand for this object.

#### Note

This function is usually not implemented directly, but by using [Server\\_object\\_t](#) template with an IPC interface definition.

#### Returns

The needed server-side receive buffers for this object

Implemented in [L4::Epiface\\_t0< IFACE, L4::Epiface >](#), [L4::Epiface\\_t0< L4::Kobject, L4::Epiface >](#), [L4::Epiface\\_t0< L4::virtio::Device, L4::Epiface\\_t0< void, Epiface >, L4::Epiface\\_t0< RPC\\_IFACE, BASE >, L4::Server\\_object\\_t< IFACE, BASE >, L4::Server\\_object\\_t< IFACE, L4::Server\\_object >, and L4::Server\\_object\\_t< Kobject >](#).

### 15.97.2.3 obj\_cap()

```
Stored_cap L4::Epiface::obj_cap ( ) const [inline]
```

Get the capability to the kernel object belonging to this object.

#### Returns

Capability for the kernel object behind the server.

This is usually either an [lpc\\_gate](#) or an [lirq](#).

Definition at line 217 of file [ipc\\_epiface](#).

Referenced by [L4Re::Util::Object\\_registry::unregister\\_obj\(\)](#).

Here is the caller graph for this function:

### 15.97.2.4 server\_iface()

```
Server_iface * L4::Epiface::server_iface ( ) const [inline]
```

Get pointer to server interface at which the object is currently registered.

#### Returns

Pointer to the server at which the object is currently registered, NULL if the object is not registered at any server.

Definition at line 224 of file [ipc\\_epiface](#).

### 15.97.2.5 set\_server()

```
int L4::Epiface::set_server (
    Server_iface * srv,
    Cap< void > cap,
    bool managed = false ) [inline]
```

Set server registration info for the object.

#### Parameters

<i>srv</i>	The server to register at
<i>cap</i>	The capability that connects the object.
<i>managed</i>	Mark the capability as managed or unmanaged. Typical server implementations use this flag to remember whether the capability was internally allocated or not.

#### Returns

0 on success, -L4\_EINVAL if the srv and cap are not consistent.

Definition at line 235 of file [ipc\\_epiface](#).

References [L4\\_EINVAL](#).

Referenced by [L4Re::Util::Object\\_registry::unregister\\_obj\(\)](#).

Here is the caller graph for this function:

### 15.99.1 Detailed Description

```
template<typename RPC_IFACE, typename BASE = Epiface>
struct L4::Epiface_t0< RPC_IFACE, BASE >
```

[Epiface](#) mixin for generic Kobject-based interfaces.

#### Template Parameters

<i>RPC_IFACE</i>	Data type of the IPC interface definition.
<i>BASE</i>	Base <a href="#">Epiface</a> class.

Definition at line 267 of file [ipc\\_epiface](#).

### 15.99.2 Member Function Documentation

#### 15.99.2.1 [obj\\_cap\(\)](#)

```
template<typename RPC_IFACE , typename BASE = Epiface>
Cap< RPC_IFACE > L4::Epiface\_t0< RPC_IFACE, BASE >::obj_cap ( ) const [inline]
```

Get the (typed) capability to this object.

#### Returns

Capability for the kernel object behind the server.

Definition at line 280 of file [ipc\\_epiface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_epiface](#)

## 15.100 L4::Exception Class Reference

[Exception](#) interface.

```
#include <exception>
```

Inherits L4::Kobject\_0t< Derived, PROTO, S\_DEMAND >.

Collaboration diagram for L4::Exception:

### Public Member Functions

- [l4\\_msgtag\\_t](#) [exception](#) ([L4::lpc::In\\_out](#)< [l4\\_exc\\_regs\\_t](#) \* > regs, [L4::lpc::Rcv\\_fpage](#) rwin, [L4::lpc::Opt](#)< [L4::lpc::Snd\\_fpage](#) & > fp)  
*Exception call.*

### 15.100.1 Detailed Description

[Exception](#) interface.

This class defines the interface for handling exception IPC. When an exception occurs during program execution, for example due to a division by zero, the kernel will synthesise an exception IPC and send it to the thread's exception handler, who can then handle it.

The exception handler is set with the [L4::Thread::control](#) interface.

Definition at line 42 of file [exception](#).

### 15.100.2 Member Function Documentation

#### 15.100.2.1 exception()

```
l4\_msgtag\_t L4::Exception::exception (
    L4::lpc::In\_out< l4\_exc\_regs\_t * > regs,
    L4::lpc::Rcv\_fpage rwin,
    L4::lpc::Opt< L4::lpc::Snd\_fpage & > fp )
```

[Exception](#) call.

## Parameters

	<i>regs</i>	Register state of the faulting thread.
	<i>rwin</i>	Receive window in the address space.
out	<i>fp</i>	Optional flex-page to resolve the exception.

## Returns

Message tag containing error code.

The documentation for this class was generated from the following file:

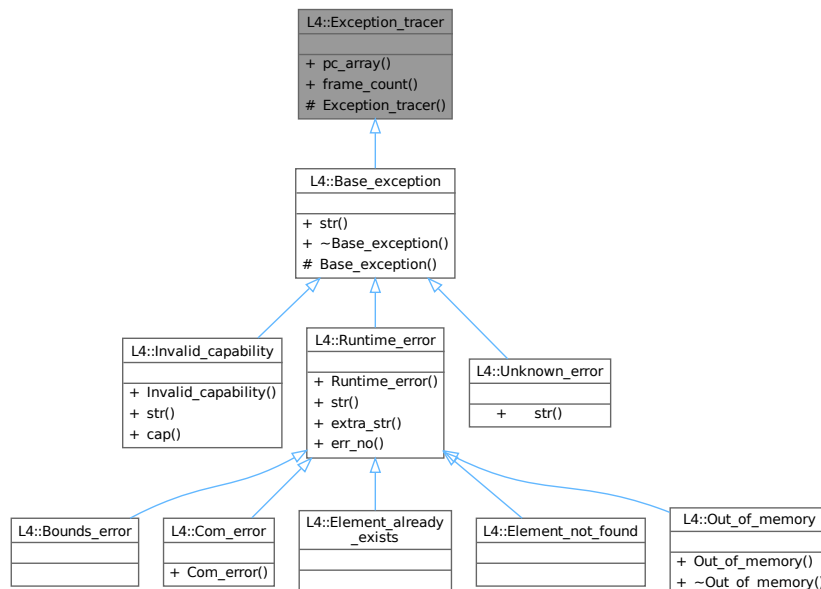

- [l4/sys/exception](#)

## 15.101 L4::Exception\_tracer Class Reference

Back-trace support for exceptions.

*Get the number of entries that are valid in the call trace.*

### Protected Member Functions

- **Exception\_tracer** () noexcept  
*Create a back trace.*

## 15.101.1 Detailed Description

Back-trace support for exceptions.

This class holds an array of at most [L4\\_CXX\\_EXCEPTION\\_BACKTRACE](#) instruction pointers containing the call trace at the instant when an exception was thrown.

Definition at line 62 of file [exceptions](#).

The documentation for this class was generated from the following file:

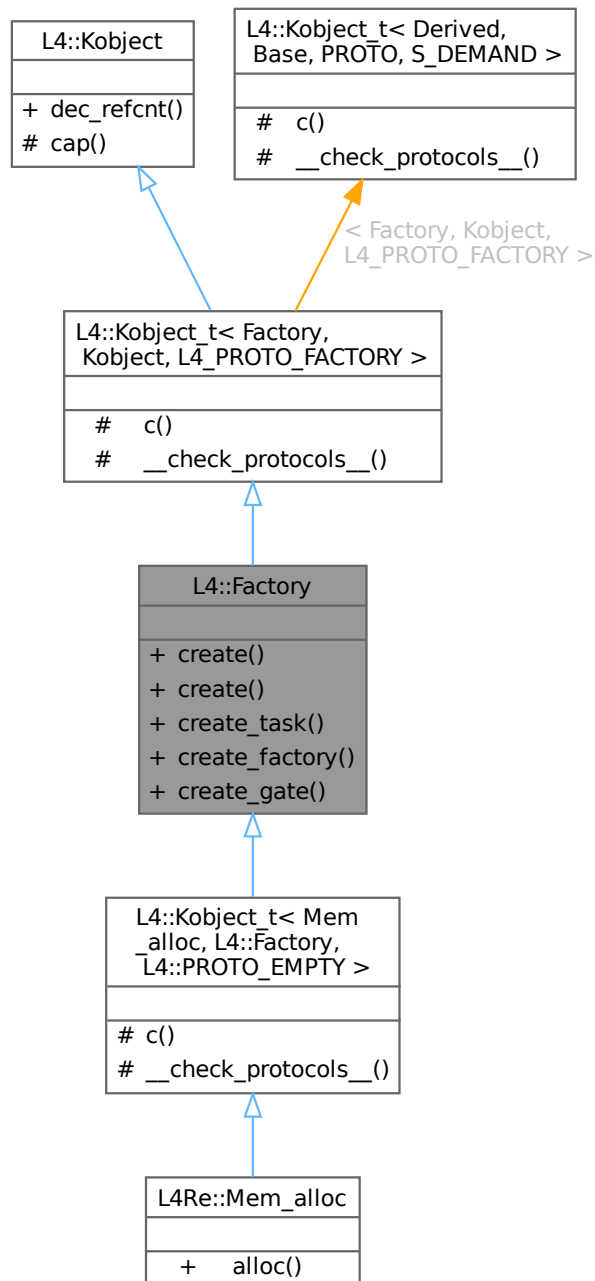

- [l4/cxx/exceptions](#)

## 15.102 L4::Factory Class Reference

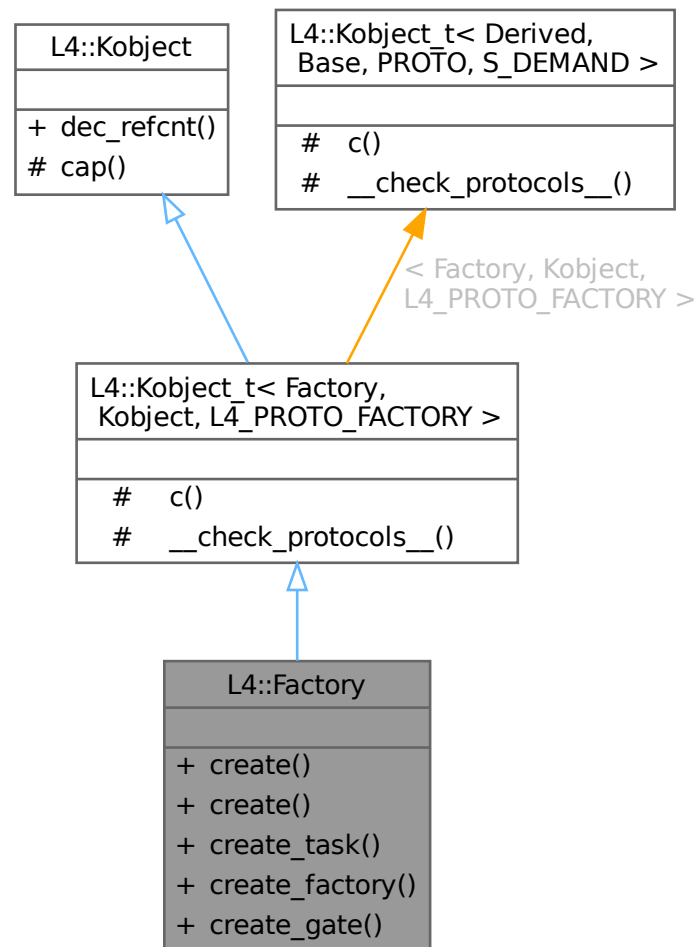

C++ Factory interface, see [Factory](#) for the C interface.

```
#include <factory>
```

### 15.102.1 Detailed Description

C++ Factory interface, see [Factory](#) for the C interface.

Factories provide an interface to create objects which are accessed via capabilities.

For additional information about which objects can be created via this interface, see server-specific information in [Kernel Factory](#) and [L4Re Servers](#).

#### Include File

```
#include <l4/sys/factory>
```

For the C interface refer to [Factory](#).

Definition at line 48 of file [factory](#).

### 15.102.2 Member Function Documentation

#### 15.102.2.1 create() [1/2]

```
template<typename OBJ >
S L4::Factory::create (
    Cap< OBJ > target,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Create call for typed capabilities.

#### Template Parameters

<i>OBJ</i>	Capability type of the object to be created.
------------	--

#### Parameters

out	<i>target</i>	Capability of type OBJ.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

A create stream that allows additional arguments to be passed to the [create\(\)](#) call via the left-shift (<<) operator.

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an [l4\\_msgtag\\_t](#), or otherwise when the stream goes out of scope.

#### Note

Refer to [S::operator l4\\_msgtag\\_t \(\)](#) for description of error codes in the returned create stream.

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to a [l4\\_msgtag\\_t](#), other UTCB-using operations must not be used.

**Usage:**

```
L4::Cap<L4Re::Dataspace> ds = L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>();
factory->create(ds) << l4_mword_t(size_in_bytes);
```

Definition at line 308 of file [factory](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.102.2.2 create() [2/2]**

```
S L4::Factory::create (
    Cap< void > target,
    long obj,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Generic create call to the factory.

**Parameters**

out	<i>target</i>	Capability selector for the new object. The caller must allocate the capability slot. The kernel stores the new objects's capability into this slot.
	<i>obj</i>	The protocol ID that specifies which kind of object shall be created.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

A create stream that allows additional arguments to be passed to the [create\(\)](#) call via the left-shift (<<) operator.

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an [l4\\_msgtag\\_t](#), or otherwise when the stream goes out of scope.

**Note**

Refer to [S::operator l4\\_msgtag\\_t \(\)](#) for description of error codes in the returned create stream.

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to a [l4\\_msgtag\\_t](#), other UTCB-using operations must not be used.

See also

[create\(Cap<OBJ>, l4\\_utcb\\_t \\*\)](#)

Definition at line 274 of file [factory](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.102.2.3 create\_factory()

```

l4_msgtag_t L4::Factory::create_factory (
    Cap< Factory > const & target_cap,
    unsigned long limit,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Create a new factory.

#### Parameters

out	<i>target_cap</i>	The kernel stores the new factory's capability into this slot.
	<i>limit</i>	Limit for the new factory in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on the invoked capability and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

**Note**

In addition to memory needed for internal data structures, the `limit` (quota) of the new factory is counted towards the quota of the creating factory. The `limit` must be within  $1 \leq \text{limit} \leq 2^8 * \text{sizeof}(\text{l4\_umword\_t}) - 1) - 2$  otherwise the behavior is undefined.

This method is only guaranteed to work with the [Kernel Factory](#). For other services, use the generic [create\(\)](#) method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line 381 of file [factory](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.102.2.4 create\_gate()**

```

l4_msgtag_t L4::Factory::create_gate (
    Cap< void > const & target_cap,
    Cap< Thread > const & thread_cap,
    l4_umword_t label,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Create a new IPC gate.

**Parameters**

out	<i>target_cap</i>	The kernel stores the new IPC gate's capability into this slot.
	<i>thread_cap</i>	Optional capability selector of a thread to bind the gate to. Use <a href="#">L4_INVALID_CAP</a> to create an unbound IPC gate.
	<i>label</i>	Optional label of the gate (precisely used if <i>thread_cap</i> is valid). If <i>thread_cap</i> is valid, <i>label</i> must be present.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag containing one of the following return codes.

## Return values

<code>L4_EOK</code>	No error occurred.
<code>-L4_ENOMEM</code>	Out-of-memory during allocation of the <code>lpc_gate</code> object.
<code>-L4_EINVAL</code>	<code>thread_cap</code> is void or points to something that is not a thread.
<code>-L4_EPERM</code>	The factory instance requires <code>L4_CAP_FPAGE_S</code> rights on the invoked capability or <code>thread_cap</code> and <code>L4_CAP_FPAGE_S</code> is not present.

An unbound IPC gate can be bound to a thread using `L4::lpc_gate::bind_thread()`.

## See also

[L4::lpc\\_gate](#)

Definition at line 414 of file [factory](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

## 15.102.2.5 create\_task()

```

14_msgtag_t L4::Factory::create_task (
    Cap< Task > const & target_cap,
    14_fpage_t * utcb_area,
    14_utcb_t * utcb = 14_utcb() ) [inline], [noexcept]
  
```

Create a new task.

## Parameters

out	<code>target_cap</code>	The kernel stores the new task's capability into this slot.
in, out	<code>utcb_area</code>	Flexpage that describes an area in the address space of the new task, where the kernel should map the kernel-allocated kernel-user memory to. The kernel uses the kernel-user memory to store UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

## Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

## Returns

Syscall return tag

## Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on the invoked capability and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt; 0</i>	Error code.

## Note

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to [L4::Task::add\\_ku\\_mem](#) for adding more of this type of memory.

### 15.105.1 Detailed Description

Stream class for the [create\(\)](#) argument stream.

This stream allows a variable number of arguments to be added to a [create\(\)](#) call.

Definition at line 89 of file [factory](#).

### 15.105.2 Constructor & Destructor Documentation

#### 15.105.2.1 S() [1/2]

```
L4::Factory::S::S (
    S && o ) [inline], [noexcept]
```

Move ...

##### Parameters

<i>o</i>	Instance of <a href="#">S</a> to move.
----------	--

Definition at line 108 of file [factory](#).

References [l4\\_msgtag\\_t::raw](#).

#### 15.105.2.2 S() [2/2]

```
L4::Factory::S::S (
    l4_cap_idx_t f,
    long obj,
    L4::Cap< void > target,
    l4_utcb_t * utcb ) [inline], [noexcept]
```

Create a stream for a specific [create\(\)](#) call.

##### Parameters

	<i>f</i>	The capability for the factory object ( <a href="#">L4::Factory</a> ).
	<i>obj</i>	The protocol ID to describe the type of the object that shall be created.
out	<i>target</i>	The capability selector for the new object. The caller must allocate the capability slot. The kernel stores the new object's capability into this slot.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Definition at line 132 of file [factory](#).

### 15.105.3 Member Function Documentation

#### 15.105.3.1 operator l4\_msgtag\_t()

```
L4::Factory::S::operator l4_msgtag_t ( ) [inline], [noexcept]
```

Explicitly commits the operation and returns the result.

##### Returns

The result of the [create\(\)](#) operation.

##### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on the invoked capability and <a href="#">L4_CAP_FPAGE_S</a> is not present.
<i>&lt;0</i>	Error code.

Definition at line [158](#) of file [factory](#).

References [l4\\_msgtag\\_t::raw](#).

#### 15.105.3.2 put() [1/5]

```
void L4::Factory::S::put (
    char const * s ) & [inline], [noexcept]
```

Add a zero-terminated string as next argument.

##### Parameters

<i>s</i>	The string to add as next argument.
----------	-------------------------------------

The string will be added with the zero-terminator.

Definition at line [192](#) of file [factory](#).

#### 15.105.3.3 put() [2/5]

```
void L4::Factory::S::put (
    l4_fpage_t d ) & [inline], [noexcept]
```

Add a flex page as next argument.

##### Parameters

<i>d</i>	The flex page to add (there will be no map operation).
----------	--

Definition at line [224](#) of file [factory](#).

#### 15.105.3.4 put() [3/5]

```
void L4::Factory::S::put (
    l4_mword_t i ) [inline], [noexcept]
```

Put a single l4\_mword\_t as next argument.

##### Parameters

<i>i</i>	The value to add as next argument.
----------	------------------------------------

Definition at line [170](#) of file [factory](#).

#### 15.105.3.5 put() [4/5]

```
void L4::Factory::S::put (
    l4_umword_t i ) [inline], [noexcept]
```

Put a single l4\_umword\_t as next argument.

##### Parameters

<i>i</i>	The value to add as next argument.
----------	------------------------------------

Definition at line [180](#) of file [factory](#).

#### 15.105.3.6 put() [5/5]

```
void L4::Factory::S::put (
    Lstr const & s ) & [inline], [noexcept]
```

Add a pascal string as next argument.

##### Parameters

<i>s</i>	The string to add as next argument.
----------	-------------------------------------

The string will be added with the exact length given. It is the responsibility of the caller to make sure that the string is zero-terminated when that is required by the server.

Definition at line [206](#) of file [factory](#).

### 15.106.1 Detailed Description

C++ [Icu](#) interface, see [Interrupt controller](#) for the C interface.

#### Note

"ICU" is short for "interrupt control unit".

This class defines the interface for interrupt controllers. It defines functions for binding [L4::Irq](#) objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.

To setup an interrupt line the following steps are required:

1. [set\\_mode\(\)](#) (optional if interrupt has a default mode)
2. [L4::Rcv\\_endpoint::bind\\_thread\(\)](#) to attach the [L4::Irq](#) object to a thread
3. [bind\(\)](#)
4. [unmask\(\)](#) to receive the first interrupt

For certain interrupt sources only some of these steps are necessary and supported, see [L4::Scheduler](#) and [L4::Vcon](#).

At most one [L4::Irq](#) object can be bound to a certain interrupt source and a certain [L4::Irq](#) object can be bound to at most one interrupt source.

#### Include File

```
#include <l4/sys/icu>
```

Definition at line 257 of file [irq](#).

### 15.106.2 Member Function Documentation

#### 15.106.2.1 bind()

```
l4_msgtag_t L4::Icu::bind (
    unsigned irqnum,
    L4::Cap< Triggerable > irq,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

#### Parameters

<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object for the given IRQ line to bind to this ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. The caller should check the return value using [l4\\_error\(\)](#) to check for errors and to identify the correct method for unmasking the interrupt. Return values < 0 indicate an error. A return value of 0 means a direct unmask via the IRQ object using [L4::Irq::unmask](#). A return value of 1 means that the interrupt has to be unmasked via the ICU using [L4::Icu::unmask](#).

## Return values

-L4_EINVAL	<code>irq</code> is bound to an interrupt source.
-L4_EPERM	The ICU instance requires <a href="#">L4_CAP_FPAGE_W</a> on <code>irq</code> and <a href="#">L4_CAP_FPAGE_W</a> was not present.

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different [L4::Irq](#) object, only the unbinding happens. An [L4::Irq](#) object that is bound to an interrupt source will get unbound if the [L4::Irq](#) object is deleted.

## 15.106.2.2 info()

```

l4_msgtag_t L4::Icu::info (
    l4_icu_info_t * info,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Get information about the ICU features.

## Parameters

out	info	<a href="#">Info</a> structure to be filled with information.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

### 15.106.2.3 mask()

```

l4_msgtag_t L4::Icu::mask (
    unsigned irqnum,
    l4_umword_t * label = 0,
    l4_timeout_t to = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Mask an IRQ line.

## Parameters

<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 399 of file [irq](#).

References [l4\\_icu\\_mask\\_u\(\)](#).

Here is the call graph for this function:

## 15.106.2.4 msi\_info()

```

l4_msgtag_t L4::Icu::msi_info (
    l4_umword_t irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info )
  
```

Get MSI info about IRQ.

## Parameters

	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <a href="#">l4_icu_msi_info_t</a> structure receiving the address and the data value to trigger this MSI.

## Returns

Syscall return tag

### 15.106.2.5 set\_mode()

```
l4_msgtag_t L4::Icu::set_mode (
    unsigned irqnum,
    l4_umword_t mode,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Set interrupt mode.

#### Parameters

<i>irqnum</i>	IRQ line at the ICU.
<i>mode</i>	Mode, see <a href="#">L4_irq_mode</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

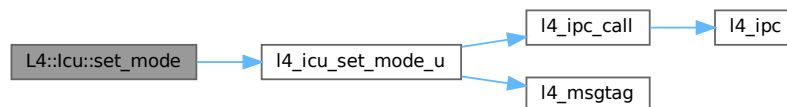

#### Returns

Syscall return tag

Definition at line 427 of file [irq](#).

References [l4\\_icu\\_set\\_mode\\_u\(\)](#).

Here is the call graph for this function:

### 15.106.2.6 unbind()

```
l4_msgtag_t L4::Icu::unbind (
    unsigned irqnum,
    L4::Cap< Triggerable > irq,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Remove binding of an interrupt line from the interrupt controller object.

#### Parameters

<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to remove from the ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag

Definition at line 334 of file [irq](#).

References [L4::Cap\\_base::cap\(\)](#), and [l4\\_icu\\_unbind\\_u\(\)](#).

Here is the call graph for this function:

## 15.108.1 Detailed Description

Indicates that an invalid object was invoked.

An Object is invalid if it has L4\_INVALID\_ID as server [L4](#) UID, or if the server does not know the object ID.

Definition at line [245](#) of file [exceptions](#).

## 15.108.2 Constructor & Destructor Documentation

### 15.108.2.1 Invalid\_capability()

```
L4::Invalid_capability::Invalid_capability (
    Cap< void > const & o ) [inline], [explicit], [noexcept]
```

Create an Invalid\_object exception for the Object o.

#### Parameters

<i>o</i>	The object that caused the server side error.
----------	---

Definition at line [255](#) of file [exceptions](#).

## 15.108.3 Member Function Documentation

### 15.108.3.1 cap()

```
Cap< void > const & L4::Invalid_capability::cap ( ) const [inline], [noexcept]
```

Get the object that caused the error.

#### Returns

The object that caused the error on invocation.

Definition at line [264](#) of file [exceptions](#).

The documentation for this class was generated from the following file:

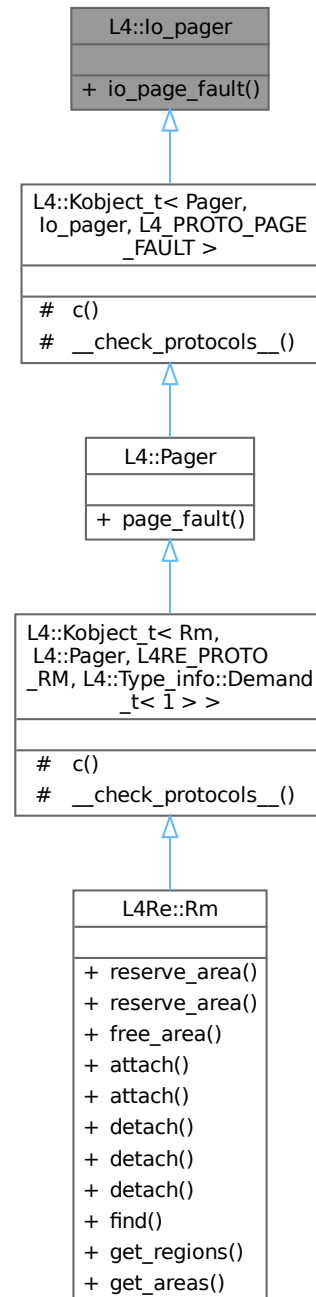

- [l4/cxx/exceptions](#)

## 15.109 L4::lo\_pager Class Reference

[lo\\_pager](#) interface.

```
#include <pager>
```

Inheritance diagram for L4::lo\_pager:

Collaboration diagram for L4::io\_pager:

### Public Member Functions

- [l4\\_msgtag\\_t](#) [io\\_page\\_fault](#) ([l4\\_fpage\\_t](#) io\_pfa, [l4\\_umword\\_t](#) pc, [L4::lpc::Rcv\\_fpage](#) rwin, [L4::lpc::Opt<L4::lpc::Snd\\_fpage & >](#) fp)  
*IO page fault protocol message.*

## 15.109.1 Detailed Description

[io\\_pager](#) interface.

### Note

This interface is IA32 specific.

This class defines the interface for handling IO page faults. IO page faults happen when a thread tries to access an IO port that it does not currently have access to.

Depending on the microkernel's implementation, IO page faults can be handled in two ways.

If the microkernel does not support IO page faults, this IO pagefault interface is not used. Instead, the microkernel sends an exception IPC to the thread's exception handler ([L4::Exception](#)), indicating a GP (exception number 13). The exception handler must consult the faulting instruction to determine the cause of the exception. This is the default in Fiasco.OC.

In contrast, if the microkernel supports IO page faults, the microkernel will generate an IO page fault message and send it to the thread's page fault handler (pager). The page fault handler can implement this interface to handle the IO page faults.

### Note

A program may use this mechanism to implement a lazy IO port access scheme.

The page fault and exception handlers are set with the [L4::Thread::control](#) interface.

Definition at line 61 of file [pager](#).

## 15.109.2 Member Function Documentation

### 15.109.2.1 io\_page\_fault()

```

l4_msgtag_t L4::Io_pager::io_page_fault (
    l4_fpage_t io_pfa,
    l4_umword_t pc,
    L4::lpc::Rcv_fpage rwin,
    L4::lpc::Opt< L4::lpc::Snd_fpage & > fp )
  
```

IO page fault protocol message.

## Parameters

	<i>io_pfa</i>	Flex-page describing the faulting IO-port.
	<i>pc</i>	Faulting program counter.
	<i>rwin</i>	The receive window for a flex-page mapping.
out	<i>fp</i>	Optional: flex-page descriptor to send to the task raising the page fault.

## Returns

System call message tag; use [l4\\_error\(\)](#) to check for errors.

IO-port fault messages are usually generated by the kernel and an IO-page-fault handler needs to be in place to handle such faults and generate a reply, potentially filling in *fp*.

The documentation for this class was generated from the following file:

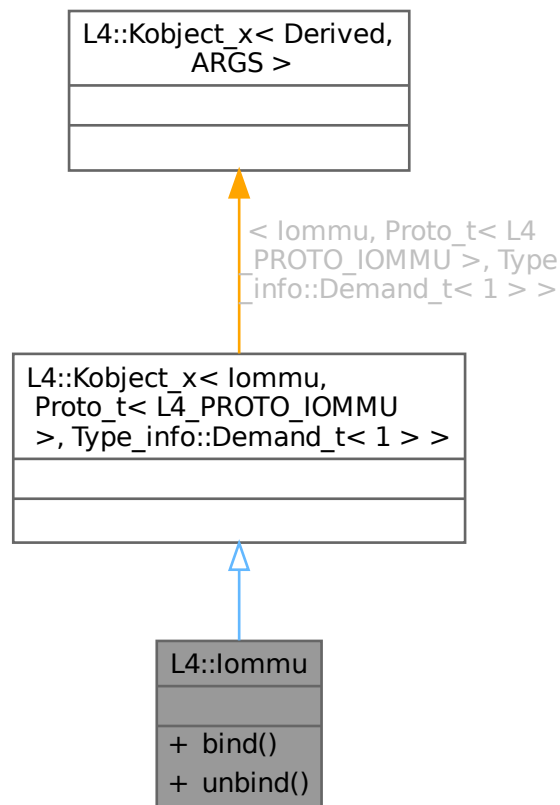

- [l4/sys/pager](#)

## 15.110 L4::lommu Class Reference

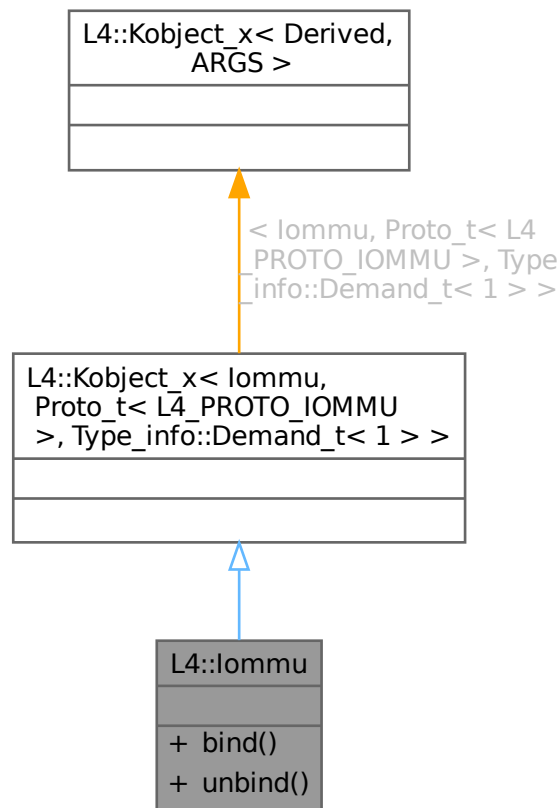

Interface for IO-MMUs used for DMA remapping.

```
#include <iommu>
```

Inheritance diagram for L4::lommu:

Collaboration diagram for L4::lommu:

### Public Member Functions

- `l4_msgtag_t bind (l4_uint64_t src_id, lpc::Cap< Task > dma_space)`  
Associate *dma\_space* with the set of device(s) specified by *src\_id*.
- `l4_msgtag_t unbind (l4_uint64_t src_id, lpc::Cap< Task > dma_space)`  
Remove the association of the given DMA address space from the device(s) specified by *src\_id*.

### 15.110.1 Detailed Description

Interface for IO-MMUs used for DMA remapping.

#### Note

This interface is only present in the kernel if the kernel detected an IOMMU during boot.

This interface allows to associate a DMA address space with a platform dependent set of devices. The kernel automatically keeps the memory spaces of associated DMA spaces in sync with the respective page table structures in the IOMMU.

Definition at line 21 of file [iommu](#).

## 15.110.2 Member Function Documentation

### 15.110.2.1 bind()

```
l4_msgtag_t L4::Iommu::bind (
    l4_uint64_t src_id,
    Ipc::Cap< Task > dma_space )
```

Associate `dma_space` with the set of device(s) specified by `src_id`.

Updates the respective page table structures in the IOMMU and keeps them in sync when memory is mapped to the `dma_space` or revoked from it.

#### Parameters

<i>src_id</i>	Platform dependent source ID specifying the set of devices that shall use <code>dma_space</code> for DMA remapping.
<i>dma_space</i>	The DMA space ( <a href="#">L4::Task</a> created with <code>L4_PROTO_DMA_SPACE</code> ) providing the mappings that shall be used for the device(s).

### 15.110.2.2 unbind()

```
l4_msgtag_t L4::Iommu::unbind (
    l4_uint64_t src_id,
    Ipc::Cap< Task > dma_space )
```

Remove the association of the given DMA address space from the device(s) specified by `src_id`.

Clear the respective page stable structures in the IOMMU.

#### Parameters

<i>src_id</i>	Platform dependent source ID specifying the set of devices that shall no longer use <code>dma_space</code> for DMA remapping.
<i>dma_space</i>	The DMA space formerly associated with <a href="#">bind()</a> .

The documentation for this class was generated from the following file:

- `l4/sys/iommu`

## 15.111 L4::IOModifier Class Reference

Modifier class for the IO stream.

```
#include <basic_ostream>
```

Collaboration diagram for L4::IOModifier:

### 15.111.1 Detailed Description

Modifier class for the IO stream.

An IO Modifier can be used to change properties of an IO stream for example the number format.

Definition at line 33 of file [basic\\_ostream](#).

The documentation for this class was generated from the following file:

- l4/cxx/[basic\\_ostream](#)

## 15.112 L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE > Struct Template Reference

[Array](#) data type for dynamically sized arrays in RPCs.

```
#include <ipc_array>
```

Inheritance diagram for L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE >:

Collaboration diagram for L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE >:

## Public Member Functions

- **Array ()**  
*Make array.*
- **Array** (LEN\_TYPE length, ELEM\_TYPE \*data)  
*Make array from length and data pointer.*
- **Array** (typename Non\_const< ELEM\_TYPE >::type const &other)  
*Make a const array from a non-const array.*

### 15.112.1 Detailed Description

```
template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default>
struct L4::lpc::Array< ELEM_TYPE, LEN_TYPE >
```

[Array](#) data type for dynamically sized arrays in RPCs.

#### Template Parameters

<i>ELEM_TYPE</i>	The data type of an array element, should be 'const' when used as input.
<i>LEN_TYPE</i>	Data type used to store the number of elements in the array.

An [Array](#) generally encapsulates a data pointer and a length (number of elements). [Array](#) does *not* provide any storage for the data itself. The storage is either provided by a client-side caller or in the case of [Array\\_ref](#) is the message itself.

Arrays can be used as input or as output arguments, when used as input ELEM\_TYPE should be qualified *const*, when used as output a reference to an array must be used and the ELEM\_TYPE must *not* be qualified *const*. It is

the caller's responsibility to provide an array buffer of sufficient length. If a message from the server is too large it will be silently truncated.

If backward compatibility with `lpc::Stream` is required, then `LEN_TYPE` must be `unsigned long`.

Definition at line 92 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/ipc_array`

### 15.113 L4::lpc::Array\_in\_buf< ELEM\_TYPE, LEN\_TYPE, MAX > Struct Template Reference

Server-side copy in buffer for [Array](#).

```
#include <ipc_array>
```

Collaboration diagram for `L4::lpc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >`:

L4::lpc::Array_in_buf < ELEM_TYPE, LEN_TYPE, MAX >	
+	data
+	length
+	copy_in()
+	Array_in_buf()
+	Array_in_buf()

#### Public Member Functions

- void **copy\_in** (const\_array a)  
*copy in data from a source array*
- **Array\_in\_buf** (const\_array a)  
*Make [Array\\_in\\_buf](#) from a const array.*
- **Array\_in\_buf** (array a)  
*Make [Array\\_in\\_buf](#) from a non-const array.*

#### Data Fields

- `ELEM_TYPE` **data** [MAX]  
*The data elements.*
- `LEN_TYPE` **length**  
*The length of the array.*

### 15.113.1 Detailed Description

```
template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default, LEN_TYPE MAX = (L4_
UTCB_GENERIC_DATA_SIZE * sizeof(I4_umword_t)) / sizeof(ELEM_TYPE)>
struct L4::lpc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >
```

Server-side copy in buffer for [Array](#).

#### Template Parameters

<i>ELEM_TYPE</i>	Data type of an array element.
<i>LEN_TYPE</i>	Data type for the number of elements in the array.
<i>MAX</i>	The maximum number of elements in the buffer. If the actual message is longer than the buffer, it will be silently truncated.

This type is assignment compatible to `Array_ref<ELEM_TYPE, LEN_TYPE>` and provides a transparent server-side copy-in mechanism for array parameters. The `Array_in_buf` provides the storage for the array data and receives a copy of the data passed to the server-function.

Definition at line 137 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

- `I4/sys/cxx/ipc_array`

## 15.114 L4::lpc::Array\_ref< ELEM\_TYPE, LEN\_TYPE > Struct Template Reference

[Array](#) reference data type for arrays located in the message.

```
#include <ipc_array>
```

Inheritance diagram for `L4::lpc::Array_ref< ELEM_TYPE, LEN_TYPE >`:

Collaboration diagram for L4::lpc::Array\_ref< ELEM\_TYPE, LEN\_TYPE >:

### 15.114.1 Detailed Description

```
template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default>
struct L4::lpc::Array_ref< ELEM_TYPE, LEN_TYPE >
```

[Array](#) reference data type for arrays located in the message.

#### Note

Use [Array](#) for normal RPC interfaces, [Array\\_ref](#) is usually used as server-side argument, see [Array](#).

#### Template Parameters

<i>ELEM_TYPE</i>	The data type of an array element, should be 'const' when used as input.
<i>LEN_TYPE</i>	Data type used to store the number of elements in the array.

Definition at line 39 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc\_array

## 15.115 L4::lpc::As\_value< T > Struct Template Reference

Pass the argument as plain data value.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::As\_value< T >:

### 15.115.1 Detailed Description

```
template<typename T>
struct L4::lpc::As_value< T >
```

Pass the argument as plain data value.

#### Template Parameters

<i>T</i>	The type of the original argument.
----------	------------------------------------

As\_value<T> is used when *T* would be otherwise interpreted specially, for example as flex page. When using As\_value<> then the argument is transmitted as plain data element.

Definition at line 127 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

## 15.116 L4::lpc::Call Struct Reference

RPC attribute for a standard RPC call.

```
#include <ipc_iface>
```

Inheritance diagram for L4::Ipc::Call:

Collaboration diagram for L4::Ipc::Call:

### 15.116.1 Detailed Description

RPC attribute for a standard RPC call.

This is the default for the *FLAGS* parameter for L4::Ipc::Msg::Rpc\_call L4::Ipc::Msg::Rpc\_inline\_call templates and declares the RPC to have default call semantics and timeouts.

Examples:

```
L4_RPC(long, send, (unsigned value), L4::Ipc::Call);
```

which is equivalent to:

```
L4_RPC(long, send, (unsigned value));
```

Definition at line 226 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.117 L4::lpc::Call\_t< RIGHTS > Struct Template Reference

RPC attribute for an RPC call with required rights.

```
#include <ipc_iface>
```

Inheritance diagram for L4::lpc::Call\_t< RIGHTS >:

Collaboration diagram for L4::lpc::Call\_t< RIGHTS >:

### 15.117.1 Detailed Description

```
template<unsigned RIGHTS>  
struct L4::lpc::Call_t< RIGHTS >
```

RPC attribute for an RPC call with required rights.

## Template Parameters

<i>RIGHTS</i>	The capability rights required for this call. <a href="#">L4_CAP_FPAGE_W</a> and <a href="#">L4_CAP_FPAGE_S</a> are checked within the server (and <a href="#">-L4_EPERM</a> shall be returned if the caller has insufficient rights). <a href="#">L4_CAP_FPAGE_R</a> is always on but might be specified for documentation purposes. Other rights cannot be used in this context, because they cannot be checked at the server side.
---------------	---

## Examples:

```
L4_RPC(long, func, (unsigned value), L4::Ipc::Call_t<L4_CAP_FPAGE_RW>);
```

Definition at line 257 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.118 L4::lpc::Call\_zero\_send\_timeout Struct Reference

RPC attribute for an RPC call, with zero send timeout.

```
#include <ipc_iface>
```

Inheritance diagram for L4::lpc::Call\_zero\_send\_timeout:

Collaboration diagram for L4::lpc::Call\_zero\_send\_timeout:

### 15.118.1 Detailed Description

RPC attribute for an RPC call, with zero send timeout.

Definition at line 236 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.119 L4::lpc::Cap< T > Class Template Reference

Capability type for RPC interfaces (see [L4::Cap<T>](#)).

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::Cap< T >:

L4::lpc::Cap< T >
<ul style="list-style-type: none"> <li>+ Cap()</li> <li>+ Cap()</li> <li>+ Cap()</li> <li>+ Cap()</li> <li>+ Cap()</li> <li>+ cap()</li> <li>+ rights()</li> <li>+ fpage()</li> <li>+ is_valid()</li> <li>+ from_ci()</li> </ul>

## Public Types

*Return the L4::Cap< T > of this **Cap**.*
- unsigned **rights** () const noexcept  
*Return the rights bits stored in this IPC cap.*
- L4::lpc::Snd\_fpage **fpage** () const noexcept  
*Return the send flexpage for this **Cap** (see [l4\\_fpage\\_t](#))*
- bool **is\_valid** () const noexcept  
*Return true if this **Cap** is valid.*

## Static Public Member Functions

- static [Cap from\\_ci](#) ([l4\\_cap\\_idx\\_t](#) c) noexcept  
*Create an IPC capability from a C capability index plus rights.*

## 15.119.1 Detailed Description

```
template<typename T>
class L4::lpc::Cap< T >
```

Capability type for RPC interfaces (see [L4 : :Cap<T>](#)).

### Template Parameters

<i>T</i>	type of the interface referenced by the capability.
----------	---

In contrast to [L4 : :Cap<T>](#) this type additionally stores a rights mask that shall be used when the capability is transferred to the receiver. This allows to apply restrictions to the transferred capability in the form of a subset of the rights possessed by the sender.

See also

[L4::lpc::make\\_cap\(\)](#)

Definition at line 562 of file [ipc\\_types](#).

## 15.119.2 Member Enumeration Documentation

### 15.119.2.1 anonymous enum

```
template<typename T >
anonymous enum
```

#### Enumerator

Rights_mask	Mask for rights bits stored internally. <a href="#">L4_FPAGE_RIGHTS_MASK</a>   <a href="#">L4_FPAGE_C_NO_REF_CNT</a>   <a href="#">L4_FPAGE_C_OBJ_RIGHTS</a> ).
Cap_mask	Mask for significant capability bits. (incl. the invalid bit to support invalid caps)

Definition at line 568 of file [ipc\\_types](#).

## 15.119.3 Constructor & Destructor Documentation

### 15.119.3.1 Cap()

```
template<typename T >
L4::Ipc::Cap< T >::Cap (
```

```
L4::Cap< T > cap,
unsigned char rights ) [inline], [noexcept]
```

Make a [Cap](#) from `L4::Cap<T>` with the given rights.

#### Parameters

<i>cap</i>	Capability to be sent.
<i>rights</i>	Rights to be sent. Consists of <a href="#">L4_fpage_rights</a> and <a href="#">L4_obj_fpage_ctl</a> .

Definition at line [614](#) of file [ipc\\_types](#).

## 15.119.4 Member Function Documentation

### 15.119.4.1 from\_ci()

```
template<typename T >
static Cap L4::Ipc::Cap< T >::from_ci (
    l4_cap_idx_t c ) [inline], [static], [noexcept]
```

Create an IPC capability from a C capability index plus rights.

#### Parameters

<i>c</i>	C capability index with the lowest 8 bits used as rights for the map operation (see <a href="#">L4_fpage_rights</a> ).
----------	--

Definition at line [622](#) of file [ipc\\_types](#).

*Return the raw base descriptor.*

### 15.120.1 Detailed Description

Generic RPC base for [L4](#) flex-pages.

Definition at line [296](#) of file [ipc\\_types](#).

### 15.120.2 Member Function Documentation

#### 15.120.2.1 [cap\\_received\(\)](#)

```
bool L4::Rpc::Gen_fpage::cap_received ( ) const [inline], [noexcept]
```

Check if at least one capability has been mapped.

The capabilities themselves can then be retrieved from the cap slots that have been provided in the receive operation.

#### Note

If this function returns `true` and the receive window covers more than one capability slot, then it is not possible to determine which slots actually got capabilities mapped from the sender.

Definition at line [365](#) of file [ipc\\_types](#).

**15.120.2.2 id\_received()**

```
bool L4::Ipc::Gen_fpage::id_received ( ) const [inline], [noexcept]
```

Check if a label was received instead of a mapping.

For IPC gates, if the L4\_RCV\_ITEM\_LOCAL\_ID has been set, then only the label of the IPC gate will be provided if the gate is local to the receiver, i.e. the target thread of the IPC gate is in the same task as the receiving thread.

The label can be retrieved with [Gen\\_fpage::data\(\)](#).

Definition at line 377 of file [ipc\\_types](#).

**15.120.2.3 is\_compound()**

```
bool L4::Ipc::Gen_fpage::is_compound ( ) const [inline], [noexcept]
```

Check if the received item has the compound bit set.

A set compound bit means the next message item of the same type will be mapped to the same receive buffer as this message item.

Definition at line 395 of file [ipc\\_types](#).

**15.120.2.4 local\_id\_received()**

```
bool L4::Ipc::Gen_fpage::local_id_received ( ) const [inline], [noexcept]
```

Check if a local capability id has been received.

If the L4\_RCV\_ITEM\_LOCAL\_ID flag has been set by the receiver, and sender and receiver are in the same task, then only the capability index is transferred.

The capability can be retrieved with [Gen\\_fpage::data\(\)](#).

Definition at line 387 of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

**15.121 L4::lpc::ln\_out< T > Struct Template Reference**

Mark an argument as in-out argument.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::ln\_out< T >:

### 15.121.1 Detailed Description

```
template<typename T>  
struct L4::lpc::In_out< T >
```

Mark an argument as in-out argument.

#### Template Parameters

<i>T</i>	The original argument type, usually a pointer or a reference.
----------	---

In\_out<> is used when an otherwise output-only value shall also be used as input value.

Definition at line 52 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

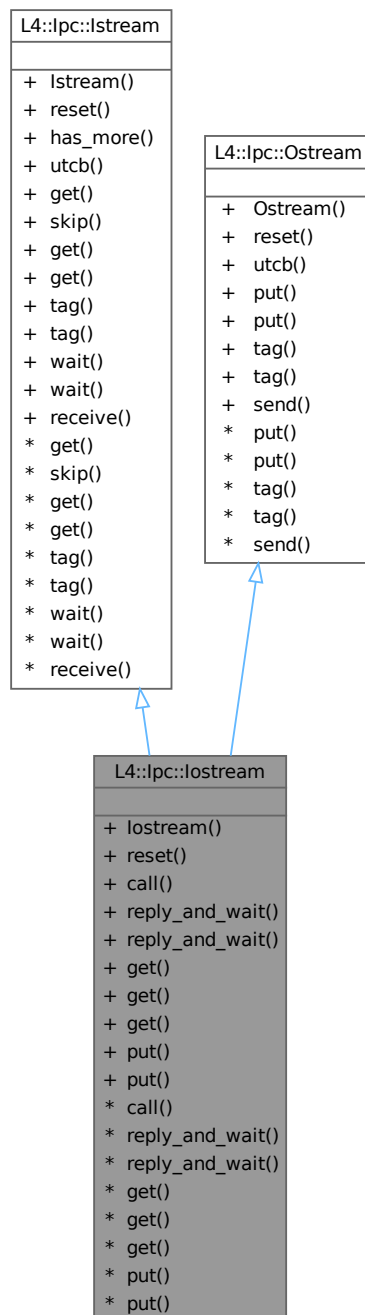

- [l4/sys/cxx/ipc\\_types](#)

## 15.122 L4::lpc::lostream Class Reference

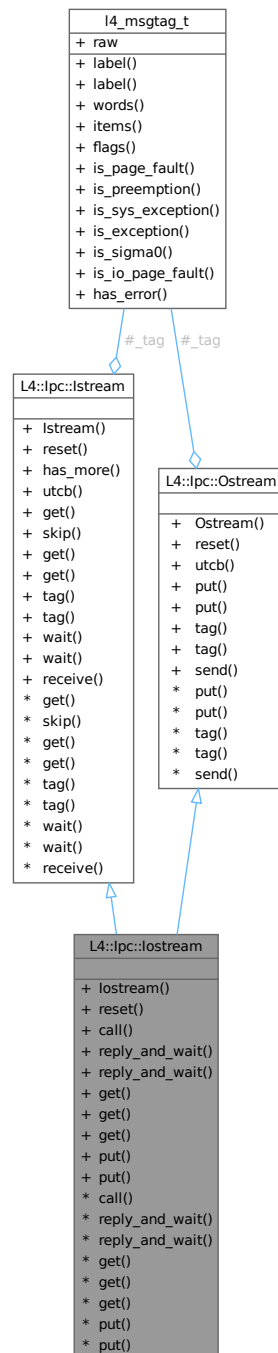

Input/Output stream for IPC [un]marshalling.

```
#include <ipc_stream>
```

Inheritance diagram for L4::lpc::lostream:

Collaboration diagram for L4::ipc::lostream:

## Public Member Functions

- `lostream` (`l4_utcb_t *utcb`)  
Create an IPC IO stream with a single message buffer.
- `void reset` ()  
Reset the stream to its initial state.

**IPC operations.**

- `l4_msgtag_t` call (`l4_cap_idx_t` dst, `l4_timeout_t` timeout, long proto=0)  
*Do an IPC call using the message in the output stream and receive the reply in the input stream.*
- `l4_msgtag_t` reply\_and\_wait (`l4_umword_t` \*src\_dst, long proto=0)  
*Do an IPC reply and wait.*
- `l4_msgtag_t` reply\_and\_wait (`l4_umword_t` \*src\_dst, `l4_timeout_t` timeout, long proto=0)  
*Do an IPC reply and wait.*

**Get/Put functions.**

These functions are basically used to implement the insertion operators (<<) and should not be called directly.

- template<typename T >  
unsigned long `get` (T \*buf, unsigned long elems)  
*Copy out an array of type T with size elements.*
- template<typename T >  
unsigned long `get` (Msg\_ptr< T > const &buf, unsigned long elems=1)  
*Read one size elements of type T from the stream and return a pointer.*
- template<typename T >  
bool `get` (T &v)  
*Extract a single element of type T from the stream.*
- template<typename T >  
bool `put` (T \*buf, unsigned long size)  
*Put an array with size elements of type T into the stream.*
- template<typename T >  
bool `put` (T const &v)  
*Insert an element of type T into the stream.*

**Public Member Functions inherited from L4::lpc::lstream**

- `lstream` (`l4_utcb_t` \*utcb)  
*Create an input stream for the given message buffer.*
- void `reset` ()  
*Reset the stream to empty, and ready for `receive()`/`wait()`.*
- template<typename T >  
bool `has_more` (unsigned long count=1)  
*Check whether a value of type T can be obtained from the stream.*
- `l4_utcb_t` \* `utcb` () const  
*Return utcb pointer.*
- template<typename T >  
unsigned long `get` (T \*buf, unsigned long elems)  
*Copy out an array of type T with size elements.*
- template<typename T >  
void `skip` (unsigned long elems)  
*Skip size elements of type T in the stream.*
- template<typename T >  
unsigned long `get` (Msg\_ptr< T > const &buf, unsigned long elems=1)  
*Read one size elements of type T from the stream and return a pointer.*
- template<typename T >  
bool `get` (T &v)  
*Extract a single element of type T from the stream.*
- `l4_msgtag_t` tag () const

- `l4_msgtag_t & tag ()`  
Get the message tag of a received IPC.
- `l4_msgtag_t wait (l4_umword_t *src)`  
Wait for an incoming message from any sender.
- `l4_msgtag_t wait (l4_umword_t *src, l4_timeout_t timeout)`  
Wait for an incoming message from any sender.
- `l4_msgtag_t receive (l4_cap_idx_t src)`  
Wait for a message from the specified sender.

## Public Member Functions inherited from `L4::lpc::Ostream`

- **Ostream** (`l4_utcb_t *utcb`)  
Create an IPC output stream using the given message buffer `utcb`.
- void **reset** ()  
Reset the stream to empty, same state as a newly created stream.
- `l4_utcb_t * utcb () const`  
Return `utcb` pointer.
- `template<typename T >`  
`bool put (T *buf, unsigned long size)`  
Put an array with `size` elements of type `T` into the stream.
- `template<typename T >`  
`bool put (T const &v)`  
Insert an element of type `T` into the stream.
- `l4_msgtag_t tag () const`  
Extract the `L4` message tag from the stream.
- `l4_msgtag_t & tag ()`  
Extract a reference to the `L4` message tag from the stream.
- `l4_msgtag_t send (l4_cap_idx_t dst, long proto=0, unsigned flags=0)`  
Send the message via IPC to the given receiver.

### 15.122.1 Detailed Description

Input/Output stream for IPC [un]marshalling.

The `lpc::lostream` is part of the AW Env IPC framework as well as `lpc::lstream` and `lpc::Ostream`. In particular an `lpc::lostream` is a combination of an `lpc::lstream` and an `lpc::Ostream`. It can use either a single message buffer for receiving and sending messages or a pair of a receive and a send buffer. The stream also supports combined IPC operations such as `call()` and `reply_and_wait()`, which can be used to implement RPC functionality.

#### Examples

`examples/libs/l4re/c++/shared_ds/ds_srv.cc`, `examples/libs/l4re/streammap/client.cc`, and `examples/libs/l4re/streammap/server.cc`.

Definition at line 800 of file `ipc_stream`.

### 15.122.2 Constructor & Destructor Documentation

#### 15.122.2.1 `lostream()`

```
L4::Ipc::lostream::lostream (
    l4_utcb_t * utcb ) [inline], [explicit]
```

Create an IPC IO stream with a single message buffer.

## Parameters

<i>utcb</i>	The message buffer used as backing store.
-------------	---

The created IO stream uses the same message buffer for sending and receiving IPC messages.

Definition at line 812 of file [ipc\\_stream](#).

### 15.122.3 Member Function Documentation

#### 15.122.3.1 call()

```
l4_msgtag_t L4::Ipc::Iostream::call (
    l4_cap_idx_t dst,
    l4_timeout_t timeout,
    long proto = 0 ) [inline]
```

Do an IPC call using the message in the output stream and receive the reply in the input stream.

## Parameters

<i>dst</i>	The destination to call.
<i>timeout</i>	The IPC timeout for the call.
<i>proto</i>	The protocol value to use in the message tag.

## Returns

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send and a receive to/from the given destination *dst*.

A call is usually used by clients for RPCs to a server.

## Examples

[examples/libs/l4re/streammap/client.cc](#).

Definition at line 977 of file [ipc\\_stream](#).

References [l4\\_ipc\\_call\(\)](#), and [L4::lpc::Iostream::tag\(\)](#).

Here is the call graph for this function:

**15.122.3.2** `get()` [1/3]

```
template<typename T >
unsigned long L4::Ipc::Istream::get (
    Msg_ptr< T > const & buf,
    unsigned long elems = 1 ) [inline]
```

Read one size elements of type T from the stream and return a pointer.

**Parameters**

<i>buf</i>	A <a href="#">Msg_ptr</a> that is actually set to point to the element in the stream.
<i>elems</i>	Number of elements to extract (default is 1).

**Returns**

The number of elements extracted.

In contrast to a normal `get`, this version does actually not copy the data but returns a pointer to the data.

See [operator>>\(\)](#)

Definition at line 450 of file [ipc\\_stream](#).

**15.122.3.3** `get()` [2/3]

```
template<typename T >
bool L4::Ipc::Istream::get (
    T & v ) [inline]
```

Extract a single element of type T from the stream.

**Parameters**

<i>out</i>	<i>v</i>	The element.
------------	----------	--------------

**Return values**

<i>true</i>	An element was successfully extracted.
<i>false</i>	An element could not be extracted.

See [operator>>\(\)](#)

Definition at line 475 of file [ipc\\_stream](#).

**15.122.3.4** `get()` [3/3]

```
template<typename T >
unsigned long L4::Ipc::Istream::get (
```

```
T * buf,
unsigned long elems ) [inline]
```

Copy out an array of type `T` with `size` elements.

#### Parameters

<i>buf</i>	Pointer to a buffer for <code>size</code> elements of type <code>T</code> .
<i>elems</i>	Number of elements of type <code>T</code> to copy out.

#### Returns

The number of elements copied out.

See [operator>>\(\)](#)

Definition at line 405 of file [ipc\\_stream](#).

### 15.122.3.5 put() [1/2]

```
template<typename T >
bool L4::Ipc::Ostream::put (
    T * buf,
    unsigned long size ) [inline]
```

Put an array with `size` elements of type `T` into the stream.

#### Parameters

<i>buf</i>	A pointer to the array to insert into the buffer.
<i>size</i>	The number of elements in the array.

Definition at line 671 of file [ipc\\_stream](#).

### 15.122.3.6 put() [2/2]

```
template<typename T >
bool L4::Ipc::Ostream::put (
    T const & v ) [inline]
```

Insert an element of type `T` into the stream.

#### Parameters

<i>v</i>	The element to insert.
----------	------------------------

Definition at line 689 of file [ipc\\_stream](#).

### 15.122.3.7 `reply_and_wait()` [1/2]

```
l4_msgtag_t L4::Ipc::Iostream::reply_and_wait (
    l4_umword_t * src_dst,
    l4_timeout_t timeout,
    long proto = 0 ) [inline]
```

Do an IPC reply and wait.

#### Parameters

<code>in, out</code>	<code>src_dst</code>	Input: the destination for the send operation. Output: the source of the received message.
	<code>timeout</code>	Timeout used for IPC.
	<code>proto</code>	Protocol to use.

#### Returns

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.

A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.

Definition at line 992 of file [ipc\\_stream](#).

References [l4\\_ipc\\_reply\\_and\\_wait\(\)](#), and [L4::Ipc::Iostream::tag\(\)](#).

Here is the call graph for this function:

### 15.122.3.8 `reply_and_wait()` [2/2]

```
l4_msgtag_t L4::Ipc::Iostream::reply_and_wait (
    l4_umword_t * src_dst,
    long proto = 0 ) [inline]
```

Do an IPC reply and wait.

## Parameters

<code>in, out</code>	<code>src_dst</code>	Input: the destination for the send operation. Output: the source of the received message.
	<code>proto</code>	Protocol to use.

## Returns

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.

A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.

Definition at line 885 of file [ipc\\_stream](#).

References [L4\\_IPC\\_SEND\\_TIMEOUT\\_0](#), and [reply\\_and\\_wait\(\)](#).

Referenced by [reply\\_and\\_wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.122.3.9 reset()

```
void L4::Ipc::Iostream::reset ( ) [inline]
```

Reset the stream to its initial state.

Input as well as the output stream are reset.

Definition at line 826 of file [ipc\\_stream](#).

References [L4::Ipc::Istream::reset\(\)](#), and [L4::Ipc::Ostream::reset\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

*Wait for a message from the specified sender.*

### 15.123.1 Detailed Description

Input stream for IPC unmarshalling.

[lpc::Istream](#) is part of the dynamic IPC marshalling infrastructure, as well as [lpc::Ostream](#) and [lpc::Iostream](#).

[lpc::Istream](#) is an input stream supporting extraction of values from an IPC message buffer. A received IPC message can be unmarshalled using the usual extraction operator (>>).

There exist some special wrapper classes to extract arrays (see `lpc_buf_cp_in` and `lpc_buf_in`) and indirect strings (see `Msg_in_buffer` and `Msg_io_buffer`).

Definition at line 345 of file [ipc\\_stream](#).

### 15.123.2 Constructor & Destructor Documentation

#### 15.123.2.1 Istream()

```
L4::Ipc::Istream::Istream (
    l4_utcb_t * utcb ) [inline]
```

Create an input stream for the given message buffer.

The given message buffer is used for IPC operations [wait\(\)](#)/[receive\(\)](#) and received data can be extracted using the >> operator afterwards. In the case of indirect message parts a buffer of type `Msg_in_buffer` must be inserted into the stream before the IPC operation and contains received data afterwards.

## Parameters

<i>utcb</i>	The message buffer to receive IPC messages.
-------------	---

Definition at line 359 of file [ipc\\_stream](#).

### 15.123.3 Member Function Documentation

#### 15.123.3.1 `get()` [1/3]

```
template<typename T >
unsigned long L4::Ipc::Istream::get (
    Msg\_ptr< T > const & buf,
    unsigned long elems = 1 ) [inline]
```

Read one size elements of type T from the stream and return a pointer.

## Parameters

<i>buf</i>	A <a href="#">Msg_ptr</a> that is actually set to point to the element in the stream.
<i>elems</i>	Number of elements to extract (default is 1).

## Returns

The number of elements extracted.

In contrast to a normal `get`, this version does actually not copy the data but returns a pointer to the data.

See [operator>>\(\)](#)

Definition at line 450 of file [ipc\\_stream](#).

References [L4\\_UNLIKELY](#).

#### 15.123.3.2 `get()` [2/3]

```
template<typename T >
bool L4::Ipc::Istream::get (
    T & v ) [inline]
```

Extract a single element of type T from the stream.

## Parameters

<i>out</i>	<i>v</i>	The element.
------------	----------	--------------

## Return values

<i>true</i>	An element was successfully extracted.
-------------	--

## Return values

<i>false</i>	An element could not be extracted.
--------------	------------------------------------

See [operator>>\(\)](#)

Definition at line 475 of file [ipc\\_stream](#).

**15.123.3.3 get() [3/3]**

```
template<typename T >
unsigned long L4::Ipc::Istream::get (
    T * buf,
    unsigned long elems ) [inline]
```

Copy out an array of type T with `size` elements.

## Parameters

<i>buf</i>	Pointer to a buffer for size elements of type T.
<i>elems</i>	Number of elements of type T to copy out.

## Returns

The number of elements copied out.

See [operator>>\(\)](#)

Definition at line 405 of file [ipc\\_stream](#).

References [L4\\_UNLIKELY](#).

Referenced by [operator>>\(\)](#), [operator>>\(\)](#), [operator>>\(\)](#), [operator>>\(\)](#), and [operator>>\(\)](#).

#### 15.123.3.4 receive()

```
l4_msgtag_t L4::Ipc::Istream::receive (
    l4_cap_idx_t src ) [inline]
```

Wait for a message from the specified sender.

##### Parameters

<code>src</code>	The sender id to receive from.
------------------	--------------------------------

##### Returns

The IPC result tag ([l4\\_msgtag\\_t](#)).

This is commonly known as 'closed wait'.

Definition at line 583 of file [ipc\\_stream](#).

References [L4\\_IPC\\_NEVER](#), and [receive\(\)](#).

Referenced by [receive\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.123.3.5 reset()

```
void L4::Ipc::Istream::reset ( ) [inline]
```

Reset the stream to empty, and ready for [receive\(\)/wait\(\)](#).

The stream is reset to the same state as on its creation.

Definition at line [369](#) of file [ipc\\_stream](#).

References [l4\\_msg\\_regs\\_t::mr](#).

### 15.123.3.6 skip()

```
template<typename T >
void L4::Ipc::Istream::skip (
    unsigned long elems ) [inline]
```

Skip size elements of type T in the stream.

#### Parameters

<i>elems</i>	Number of elements to skip.
--------------	-----------------------------

Definition at line 425 of file [ipc\\_stream](#).

References [L4\\_UNLIKELY](#).

### 15.123.3.7 tag() [1/2]

```
l4\_msgtag\_t & L4::Ipc::Istream::tag ( ) [inline]
```

Get the message tag of a received IPC.

#### Returns

A reference to the [L4](#) message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.

See [operator>>\(\)](#)

Definition at line 528 of file [ipc\\_stream](#).

### 15.123.3.8 tag() [2/2]

```
l4\_msgtag\_t L4::Ipc::Istream::tag ( ) const [inline]
```

Get the message tag of a received IPC.

**Returns**

The [L4](#) message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.

See [operator>>\(\)](#)

Definition at line [516](#) of file [ipc\\_stream](#).

Referenced by [L4::lpc::lostream::call\(\)](#), [operator>>\(\)](#), [L4::lpc::lostream::reply\\_and\\_wait\(\)](#), and [wait\(\)](#).

```
template<typename T>
struct L4::lpc::Msg::ls_valid_rpc_type< T >
```

Type trait defining a valid RPC parameter type.

Definition at line 350 of file [ipc\\_basics](#).

The documentation for this struct was generated from the following file:

- `I4/sys/cxx/ipc_basics`

Collaboration diagram for L4::lpc::Msg::Svr\_val\_ops< MTYPE, DIR, CLASS >:

### 15.140.1 Detailed Description

**template<typename MTYPE, typename DIR, typename CLASS>**  
**struct L4::lpc::Msg::Svr\_val\_ops< MTYPE, DIR, CLASS >**

Defines server-side handling for MTYPE server arguments.

#### Template Parameters

<i>MTYPE</i>	Elem<T>::svr_type (where T is the type used in the RPC definition)
<i>DIR</i>	<a href="#">Dir_in</a> (client -> server), or <a href="#">Dir_out</a> (server -> client)
<i>CLASS</i>	<a href="#">Cls_data</a> , <a href="#">Cls_item</a> , or <a href="#">Cls_buffer</a>

Definition at line 275 of file [ipc\\_basics](#).

The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc\_basics

## 15.141 L4::lpc::Msg\_ptr< T > Class Template Reference

Pointer to an element of type T in an [lpc::lstream](#).

```
#include <ipc_stream>
```

Collaboration diagram for L4::lpc::Msg\_ptr< T >:

## Public Member Functions

- [Msg\\_ptr](#) (T \*&p)

Create a [Msg\\_ptr](#) object that set pointer *p* to point into the message buffer.

### 15.141.1 Detailed Description

```
template<typename T>
class L4::lpc::Msg_ptr< T >
```

Pointer to an element of type *T* in an [lpc::lstream](#).

This wrapper can be used to extract an element of type *T* from an [lpc::lstream](#), whereas the data is not copied out, but a pointer into the message buffer itself is returned. With is mechanism it is possible to avoid an extra copy of large data structures from a received IPC message, instead the returned pointer gives direct access to the data in the message.

See [msg\\_ptr\(\)](#).

Definition at line 240 of file [ipc\\_stream](#).

### 15.141.2 Constructor & Destructor Documentation

#### 15.141.2.1 Msg\_ptr()

```
template<typename T >
L4::lpc::Msg_ptr< T >::Msg_ptr (
    T *& p ) [inline], [explicit]
```

Create a [Msg\\_ptr](#) object that set pointer *p* to point into the message buffer.

#### Parameters

<i>p</i>	The pointer that is adjusted to point into the message buffer.
----------	--

Definition at line 251 of file [ipc\\_stream](#).

The documentation for this class was generated from the following file:

- [l4/cxx/ipc\\_stream](#)

## 15.142 L4::lpc::Opt< T > Struct Template Reference

Attribute for defining an optional RPC argument.

## 15.143 L4::lpc::Ostream Class Reference

Output stream for IPC marshalling.

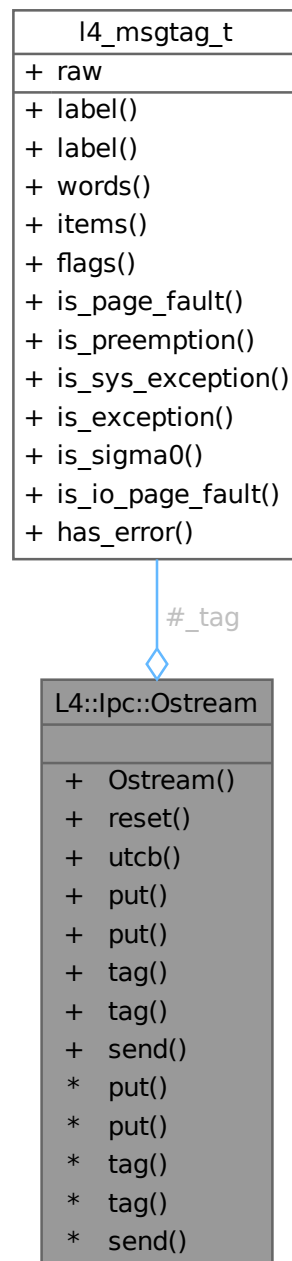

```
#include <ipc_stream>
```

Inheritance diagram for L4::lpc::Ostream:

Collaboration diagram for L4::lpc::Ostream:

## Public Member Functions

- **Ostream** ([l4\\_utcb\\_t](#) \*utcb)  
*Create an IPC output stream using the given message buffer `utcb`.*
- void **reset** ()  
*Reset the stream to empty, same state as a newly created stream.*
- [l4\\_utcb\\_t](#) \* **utcb** () const

*Return utcb pointer.*

### Get/Put functions.

*These functions are basically used to implement the insertion operators (<<) and should not be called directly.*

- `template<typename T >`  
`bool put (T *buf, unsigned long size)`  
*Put an array with `size` elements of type `T` into the stream.*
- `template<typename T >`  
`bool put (T const &v)`  
*Insert an element of type `T` into the stream.*
- `l4_msgtag_t tag () const`  
*Extract the `L4` message tag from the stream.*
- `l4_msgtag_t & tag ()`  
*Extract a reference to the `L4` message tag from the stream.*

### IPC operations.

- `l4_msgtag_t send (l4_cap_idx_t dst, long proto=0, unsigned flags=0)`  
*Send the message via IPC to the given receiver.*

## 15.143.1 Detailed Description

Output stream for IPC marshalling.

`lpc::Ostream` is part of the dynamic IPC marshalling infrastructure, as well as `lpc::Istream` and `lpc::lostream`.

`lpc::Ostream` is an output stream supporting insertion of values into an IPC message buffer. A IPC message can be marshalled using the usual insertion operator <<, see [IPC stream operators](#) .

There exist some special wrapper classes to insert arrays (see `lpc::Buf_cp_out`) and indirect strings (see `Msg_↔out_buffer` and `Msg_io_buffer`).

Definition at line 634 of file [ipc\\_stream](#).

## 15.143.2 Member Function Documentation

### 15.143.2.1 put() [1/2]

```
template<typename T >
bool L4::Ipc::Ostream::put (
    T * buf,
    unsigned long size ) [inline]
```

Put an array with `size` elements of type `T` into the stream.

#### Parameters

<i>buf</i>	A pointer to the array to insert into the buffer.
<i>size</i>	The number of elements in the array.

Definition at line 671 of file [ipc\\_stream](#).

Referenced by [operator<<\(\)](#), [operator<<\(\)](#), and [operator<<\(\)](#).

Here is the caller graph for this function:

#### 15.143.2.2 put() [2/2]

```
template<typename T >
bool L4::Ipc::Ostream::put (
    T const & v ) [inline]
```

Insert an element of type T into the stream.

##### Parameters

<i>v</i>	The element to insert.
----------	------------------------

Definition at line 689 of file [ipc\\_stream](#).

#### 15.143.2.3 send()

```
l4\_msgtag\_t L4::Ipc::Ostream::send (
    l4\_cap\_idx\_t dst,
    long proto = 0,
    unsigned flags = 0 ) [inline]
```

Send the message via IPC to the given receiver.

##### Parameters

<i>dst</i>	The destination for the message.
<i>proto</i>	Protocol to use.
<i>flags</i>	Flags to use.

**Returns**

The syscall return tag.

Definition at line 970 of file [ipc\\_stream](#).

References [L4\\_IPC\\_NEVER](#), [l4\\_ipc\\_send\(\)](#), [L4\\_MSGTAG\\_FLAGS](#), and [tag\(\)](#).

Here is the call graph for this function:

**15.143.2.4 tag() [1/2]**

```
l4_msgtag_t & L4::Ipc::Ostream::tag ( ) [inline]
```

Extract a reference to the [L4](#) message tag from the stream.

**Returns**

A reference to the [L4](#) message tag.

Definition at line 724 of file [ipc\\_stream](#).

**15.143.2.5 tag() [2/2]**

```
l4_msgtag_t L4::Ipc::Ostream::tag ( ) const [inline]
```

Extract the [L4](#) message tag from the stream.

**Returns**

The extracted [L4](#) message tag.

Definition at line [717](#) of file [ipc\\_stream](#).

Referenced by [operator<<\(\)](#), and [send\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- [l4/cxx/ipc\\_stream](#)

## 15.144 L4::ipc::Out< T > Struct Template Reference

Mark an argument as a output value in an RPC signature.

Collaboration diagram for `L4::ipc::Out< T >`:

### 15.144.1 Detailed Description

```
template<typename T>
struct L4::ipc::Out< T >
```

Mark an argument as a output value in an RPC signature.

## Template Parameters

<i>T</i>	The original type of the argument.
----------	------------------------------------

## Note

The use of Out<> is usually not needed, because typical out-put data types in C++ (pointers to non-const objects or non-const references are interpreted as output values anyway. However, there are some data types, such as returned capabilities that can be marked as such by using Out<>.

Definition at line 42 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

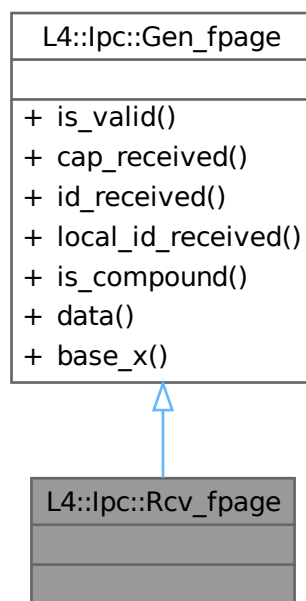

- [l4/sys/cxx/ipc\\_types](#)

## 15.145 L4::lpc::Rcv\_fpage Class Reference

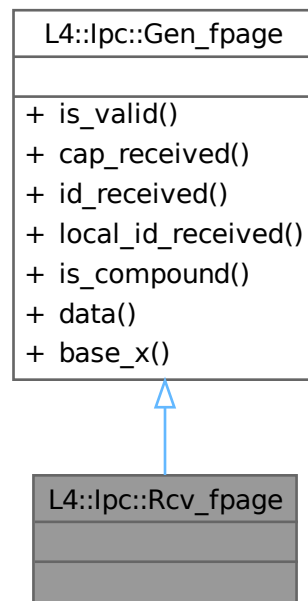

Rcv flex-page.

```
#include <ipc_types>
```

Inheritance diagram for L4::lpc::Rcv\_fpage:

*Return the raw base descriptor.*

### 15.145.1 Detailed Description

Rcv flex-page.

Definition at line 459 of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

## 15.146 L4::lpc::Ret\_array< T > Struct Template Reference

Dynamically sized output array of type T.

```
#include <ipc_ret_array>
```

Collaboration diagram for L4::lpc::Ret\_array< T >:

### 15.146.1 Detailed Description

```
template<typename T>
struct L4::lpc::Ret_array< T >
```

Dynamically sized output array of type T.

#### Template Parameters

<i>T</i>	The data-type of each array element.
----------	--------------------------------------

Ret\_array<> is a special dynamically sized output array where the number of transmitted elements is passed in the return value of the call (if positive)

Definition at line 34 of file [ipc\\_ret\\_array](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_ret\\_array](#)

## 15.147 L4::lpc::Send\_only Struct Reference

RPC attribute for a send-only RPC.

```
#include <ipc_iface>
```

Collaboration diagram for L4::lpc::Send\_only:

### 15.147.1 Detailed Description

RPC attribute for a send-only RPC.

This class can be used as FLAGS parameter to L4::lpc::Msg::Rpc\_call and L4::lpc::Msg::Rpc\_inline\_call templates and declares the RPC to use send-only semantics and timeouts.

Examples:

```
L4_RPC(long, send, (unsigned value), L4::lpc::Send_only);
```

Definition at line 274 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.148 L4::lpc::Small\_buf Class Reference

A receive item for receiving a single object capability.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::Small\_buf:

## Public Member Functions

- [Small\\_buf](#) ([L4::Cap](#)< void > cap, unsigned long flags=0) noexcept  
*Create a receive item from a C++ cap.*
- [Small\\_buf](#) ([l4\\_cap\\_idx\\_t](#) cap, unsigned long flags=0) noexcept  
*Create a receive item from a C cap.*

### 15.148.1 Detailed Description

A receive item for receiving a single object capability.

This class is the main abstraction for receiving object capabilities via [lpc::lstream](#). To receive an object capability, an instance of [Small\\_buf](#) that refers to an empty capability slot must be inserted into the [lpc::lstream](#) before the receive operation.

Definition at line 268 of file [ipc\\_types](#).

### 15.148.2 Constructor & Destructor Documentation

#### 15.148.2.1 Small\_buf() [1/2]

```
L4::Ipc::Small_buf::Small_buf (
    L4::Cap< void > cap,
    unsigned long flags = 0 ) [inline], [explicit], [noexcept]
```

Create a receive item from a C++ cap.

##### Parameters

<i>cap</i>	Capability slot where to save the capability.
<i>flags</i>	Receive buffer flags, see <a href="#">l4_msg_item_consts_t</a> . L4_RCV_ITEM_SINGLE_CAP will always be set.

Definition at line 278 of file [ipc\\_types](#).

#### 15.148.2.2 Small\_buf() [2/2]

```
L4::Ipc::Small_buf::Small_buf (
    l4\_cap\_idx\_t cap,
    unsigned long flags = 0 ) [inline], [explicit], [noexcept]
```

Create a receive item from a C cap.

##### Parameters

<i>cap</i>	Capability slot where to save the capability.
<i>flags</i>	Receive buffer flags, see <a href="#">l4_msg_item_consts_t</a> . L4_RCV_ITEM_SINGLE_CAP will always be set.

Definition at line 285 of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

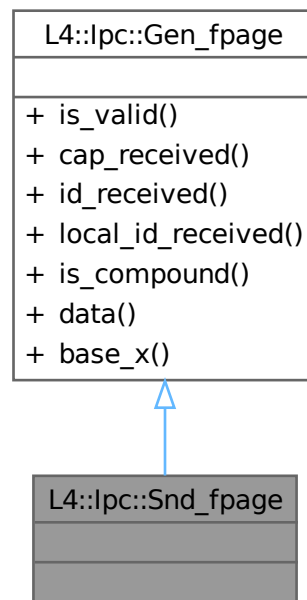

- [l4/sys/cxx/ipc\\_types](#)

## 15.149 L4::lpc::Snd\_fpage Class Reference

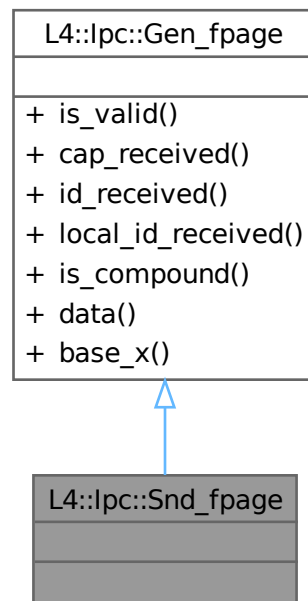

Send flex-page.

```
#include <ipc_types>
```

### 15.149.1 Detailed Description

Send flex-page.

Definition at line 407 of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

## 15.150 L4::lpc::Str\_cp\_in< T > Class Template Reference

Abstraction for extracting a zero-terminated string from an [lpc::lstream](#).

```
#include <ipc_stream>
```

Collaboration diagram for L4::lpc::Str\_cp\_in< T >:

### Public Member Functions

- [Str\\_cp\\_in](#) (T \*v, unsigned long &size)  
Create a buffer for extracting an array from an [lpc::lstream](#).

### 15.150.1 Detailed Description

```
template<typename T>
class L4::lpc::Str_cp_in< T >
```

Abstraction for extracting a zero-terminated string from an [lpc::lstream](#).

An instance of [Str\\_cp\\_in](#) can be used to extract a zero-terminated string an [lpc::lstream](#). The data from the received message is thereby copied to the given buffer and size is set to the number of characters found in the stream. The string is zero terminated in any circumstances. When the given buffer is smaller than the received string the last byte in the buffer will be the zero terminator. In the case the received string is shorter than the given buffer the zero termination will be placed behind the received data. This provides a zero-terminated result even in cases where the sender did not provide proper termination or in cases of too small receiver buffers.

See also

[str\\_cp\\_in\(\)](#).

Definition at line 189 of file [ipc\\_stream](#).

## 15.150.2 Constructor & Destructor Documentation

### 15.150.2.1 Str\_cp\_in()

```
template<typename T >
L4::Ipc::Str_cp_in< T >::Str_cp_in (
    T * v,
    unsigned long & size ) [inline]
```

Create a buffer for extracting an array from an [lpc::lstream](#).

#### Parameters

	<i>v</i>	The buffer for string.
<i>in, out</i>	<i>size</i>	Input: The number of bytes available in <i>v</i> Output: The number of bytes received (including the terminator).

Definition at line 200 of file [ipc\\_stream](#).

The documentation for this class was generated from the following file:

- [l4/cxx/ipc\\_stream](#)

## 15.151 L4::lpc::Varg Class Reference

Variably sized RPC argument.

```
#include <ipc_varg>
```

Inherited by `L4::lpc::Varg_t< T >`.

*Get the next parameter in the list.*
- **Iterator begin** () const  
*Returns an iterator to the first Varg.*
- **Iterator end** () const  
*Returns the end of the list.*

### 15.153.1 Detailed Description

List of variable-sized RPC parameters as received by the server.

The list can be traversed exactly once using [next\(\)](#).

This is a reference list, where the returned [Varg](#) point to data in the underlying storage, conventionally the UTCB. This type should only be used in server functions when the implementation can ensure that all content is read before the UTCB is reused (e.g. for IPC), otherwise use [Varg\\_list](#).

Definition at line 264 of file [ipc\\_varg](#).

## 15.153.2 Constructor & Destructor Documentation

### 15.153.2.1 Varg\_list\_ref()

```
L4::Ipc::Varg_list_ref::Varg_list_ref (
    void const * start,
    void const * end ) [inline]
```

Create a parameter list over a given memory region.

#### Parameters

<i>start</i>	Pointer to start of the parameter list.
<i>end</i>	Pointer to end of the list (inclusive).

Definition at line 343 of file [ipc\\_varg](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/ipc\\_varg](#)

## 15.154 L4::lpc::Varg\_list\_ref::Iterator Class Reference

[Iterator](#) for Valists.

*Helper to check for protocol conflicts.*

**15.155.1 Detailed Description**

The C++ IPC gate interface, see [IPC-Gate API](#) for the C interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [L4::Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [L4::Thread](#) that is *bound* to the IPC gate (cf. [bind\\_thread\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When no thread is bound yet, the forwarded IPC blocks until a thread is bound or the IPC times out.

Forwarded IPC is always forwarded to the userland of the bound thread. That means, the [L4::Thread](#) interface of the bound thread is not accessible via an IPC gate. The [L4::ipc\\_gate](#) interface of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [L4::ipc\\_gate](#) interface calls are forwarded to the bound thread instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding a thread to an IPC gate, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (cf. [bind\\_thread\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are the result of bitwise disjunction of the corresponding label bits with the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. Hence, the label provided via [bind\\_thread\(\)](#) should usually have its two least significant bits set to zero. The replaced label is only visible to the bound thread upon receive. However, the configured label of an IPC gate can also be queried via [get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [L4::Thread::modify\\_senders\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread for the first time.

When binding a new thread to an IPC gate that is currently bound, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

**Include File**

```
#include <l4/sys/ipc_gate>
```

For the C interface refer to the C [IPC-Gate API](#).

See also

[Object Invocation](#)

Definition at line 94 of file [ipc\\_gate](#).

## 15.155.2 Member Function Documentation

### 15.155.2.1 get\_infos()

```
l4_msgtag_t L4::Ipc_gate::get_infos (
    l4_umword_t * label )
```

Get information about the IPC-gate.

#### Parameters

out	<i>label</i>	The label of the IPC gate is returned here.
-----	--------------	---

#### Returns

System call return tag.

#### Precondition

If the IPC gate capability used to invoke this operation does not possess the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread is bound yet.

The documentation for this class was generated from the following file:

- [l4/sys/ipc\\_gate](#)

## 15.156 L4::lpc\_svr::Br\_manager\_no\_buffers Class Reference

Empty implementation of [Server\\_iface](#).

```

## Additional Inherited Members

## Public Types inherited from [L4::lpc\\_svr::Server\\_iface](#)

- typedef [L4::Type\\_info::Demand](#) **Demand**  
*Data type expressing server-side demand for receive buffers.*

### 15.156.1 Detailed Description

Empty implementation of [Server\\_iface](#).

This implementation of [Server\\_iface](#) provides no buffer or timeout management at all it just returns errors for all calls that express other than empty demands. However, this may be useful for very simple servers that serve simple server objects only.

Definition at line 184 of file [ipc\\_server\\_loop](#).

### 15.156.2 Member Function Documentation

#### 15.156.2.1 [alloc\\_buffer\\_demand\(\)](#)

```
int L4::Ipc_svr::Br_manager_no_buffers::alloc_buffer_demand (
    Demand const & demand ) [inline], [override], [virtual]
```

Tells the server to allocate buffers for the given demand.

#### Parameters

<i>demand</i>	The total server-side demand of receive buffers needed for a given interface, see <a href="#">Demand</a> .
---------------	--

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

#### Returns

success (0) if demand is empty, -L4\_ENOMEM else.

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 191 of file [ipc\\_server\\_loop](#).

References [L4\\_ENOMEM](#), [L4\\_EOK](#), and [L4::Type\\_info::Demand::no\\_demand\(\)](#).

struct L4::lpc_svr::Direct_dispatch< R * >
```

Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry *R*.

#### Template Parameters

<i>R</i>	Data type of the registry that is used for dispatching to different server objects, usually based on the protected IPC label.
----------	---

Definition at line 120 of file [ipc\\_server\\_loop](#).

The documentation for this struct was generated from the following file:

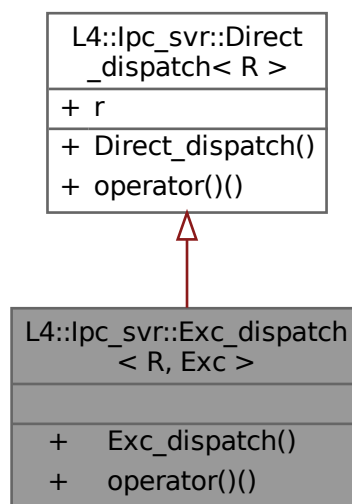

- l4/sys/cxx/ipc\_server\_loop

### 15.163 L4::lpc\_svr::Exc\_dispatch< R, Exc > Struct Template Reference

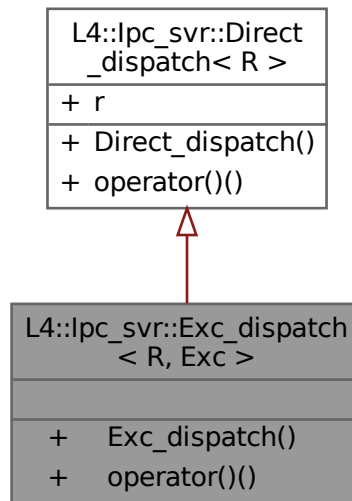

Dispatch helper wrapping try {} catch {} around the dispatch call.

```
#include <ipc_server_loop>
```

## Public Member Functions

- **Exc\_dispatch** (R r)  
*Make an exception handling dispatcher.*
- **l4\_msgtag\_t operator()** (l4\_msgtag\_t tag, l4\_umword\_t obj, l4\_utcb\_t \*utcb)  
*Dispatch the call via Direct\_dispatch<R>() and handle exceptions.*

### 15.163.1 Detailed Description

```
template<typename R, typename Exc>
struct L4::lpc_svr::Exc_dispatch< R, Exc >
```

Dispatch helper wrapping try {} catch {} around the dispatch call.

#### Template Parameters

<i>R</i>	Data type of the registry used for dispatching to objects.
<i>Exc</i>	Data type of the exceptions that shall be caught. This data type must provide a member <code>err_no()</code> that returns the negative integer (int) error code for the exception.

This dispatcher wraps `Direct_dispatch<R>` with a try-catch (`Exc`).

Definition at line 144 of file [ipc\\_server\\_loop](#).

The documentation for this struct was generated from the following file:

### 15.165.1 Detailed Description

Interface for server-loop related functions.

This interface provides access to high-level server-loop related functions, such as management of receive buffers and timeouts.

Definition at line 47 of file [ipc\\_epiface](#).

### 15.165.2 Member Function Documentation

#### 15.165.2.1 add\_timeout()

```
virtual int L4::Ipc_svr::Server_iface::add_timeout (
    Timeout * timeout,
    l4_kernel_clock_t time ) [pure virtual]
```

Add a timeout to the server internal timeout queue.

##### Parameters

<i>timeout</i>	The timeout object to register.
<i>time</i>	The time (absolute) at which the timeout shall expire.

##### Precondition

*timeout* must not be in any queue.

##### Returns

0 on success, 1 if timeout is already expired, < 0 on error.

Implemented in [L4Re::Util::Br\\_manager](#), [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks<HOOKS, BR\\_M](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks<Br\\_manager\\_timeout\\_hooks, Br\\_manager>](#), and [L4::lpc\\_svr::Timeout\\_queue\\_hooks<Loop](#)

#### 15.165.2.2 alloc\_buffer\_demand()

```
virtual int L4::Ipc_svr::Server_iface::alloc_buffer_demand (
    Demand const & demand ) [pure virtual]
```

Tells the server to allocate buffers for the given demand.

##### Parameters

<i>demand</i>	The total server-side demand of receive buffers needed for a given interface, see Demand.
---------------	---

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

Implemented in [L4Re::Util::Br\\_manager](#), and [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#).

### 15.165.2.3 get\_rcv\_cap()

```
virtual L4::Cap< void > L4::Ipc_svr::Server_iface::get_rcv_cap (
    int index ) const [pure virtual]
```

Get capability slot allocated to the given receive buffer.

#### Parameters

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

#### Precondition

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

#### Returns

Capability slot currently allocated to the given receive buffer.

Implemented in [L4Re::Util::Br\\_manager](#), and [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#).

Referenced by [rcv\\_cap\(\)](#).

Here is the caller graph for this function:

### 15.165.2.4 rcv\_cap() [1/2]

```
template<typename T >
L4::Cap< T > L4::Ipc_svr::Server_iface::rcv_cap (
    int index ) const [inline]
```

Get given receive buffer as typed capability.

#### See also

[get\\_rcv\\_cap\(\)](#)

## Parameters

<i>index</i>	The receive buffer index of the expected capability argument. ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> .)
--------------	--

## Precondition

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

## Returns

Capability slot currently allocated to the given receive buffer.

## Note

This is a convenience wrapper for [get\\_rcv\\_cap\(\)](#) to avoid [L4::cap\\_cast<>\(\)](#).

Definition at line 125 of file [ipc\\_epiface](#).

References [get\\_rcv\\_cap\(\)](#).

Here is the call graph for this function:

## 15.165.2.5 rcv\_cap() [2/2]

```

L4::Cap< void > L4::lpc_svr::Server_iface::rcv_cap (
    int index ) const [inline]
  
```

Get receive cap with the given index as generic (void) type.

## Parameters

<i>index</i>	The index of the cap receive buffer of the expected capability. ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> .)
--------------	--

## Returns

Capability slot currently allocated to the given capability buffer.

**Note**

This is a convenience wrapper for [get\\_rcv\\_cap\(\)](#).

Definition at line 137 of file [ipc\\_epiface](#).

References [get\\_rcv\\_cap\(\)](#).

Here is the call graph for this function:

**15.165.2.6 realloc\_rcv\_cap()**

```
virtual int L4::Ipc_svr::Server_iface::realloc_rcv_cap (
    int index ) [pure virtual]
```

Allocate a new capability for the given receive buffer.

**Parameters**

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

**Precondition**

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

**Returns**

0 on success, < 0 on error.

Implemented in [L4Re::Util::Br\\_manager](#), and [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#).

**15.165.2.7 remove\_timeout()**

```
virtual int L4::Ipc_svr::Server_iface::remove_timeout (
    Timeout * timeout ) [pure virtual]
```

Remove the given timeout from the timer queue.

## Parameters

<i>timeout</i>	The timeout object to remove.
----------------	-------------------------------

## Returns

0 on success, < 0 on error.

Implemented in [L4Re::Util::Br\\_manager](#), [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_M](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< Br\\_manager\\_timeout\\_hooks, Br\\_manager >](#), and [L4::lpc\\_svr::Timeout\\_queue\\_hooks< Loop\\_](#)

The documentation for this class was generated from the following file:

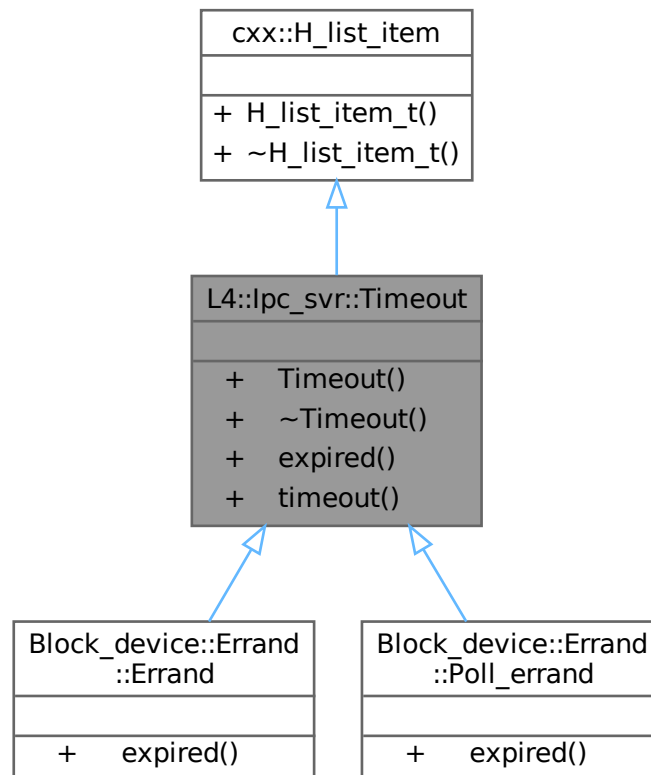

- [l4/sys/cxx/ipc\\_epiface](#)

## 15.166 L4::lpc\_svr::Timeout Class Reference

Callback interface for [Timeout\\_queue](#).

```

#### 15.166.1 Detailed Description

Callback interface for [Timeout\\_queue](#).

Definition at line 28 of file [ipc\\_timeout\\_queue](#).

## 15.166.2 Member Function Documentation

### 15.166.2.1 expired()

```
virtual void L4::Ipc_svr::Timeout::expired ( ) [pure virtual]
```

callback function to be called when timeout happened

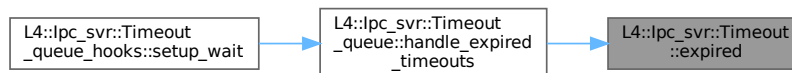

#### Note

The timeout object is already dequeued when this function is called, this means the timeout may be safely queued again within the [expired\(\)](#) function.

Implemented in [Block\\_device::Errand::Poll\\_errand](#), and [Block\\_device::Errand::Errand](#).

Referenced by [L4::lpc\\_svr::Timeout\\_queue::handle\\_expired\\_timeouts\(\)](#).

Here is the caller graph for this function:

### 15.166.2.2 timeout()

```
l4_kernel_clock_t L4::Ipc_svr::Timeout::timeout ( ) const [inline]
```

return absolute timeout of this callback.

#### Returns

absolute timeout for this instance of the timeout.

#### Precondition

The timeout object must have been in a queue before, otherwise the timeout is not set.

Definition at line 52 of file [ipc\\_timeout\\_queue](#).

The documentation for this class was generated from the following file:

- `I4/cxx/ipc_timeout_queue`

## 15.167 L4::lpc\_svr::Timeout\_queue Class Reference

[Timeout](#) queue to be used in l4re server loop.

```
#include <ipc_timeout_queue>
```

Collaboration diagram for L4::lpc\_svr::Timeout\_queue:

### Public Types

- typedef [L4::lpc\\_svr::Timeout](#) **Timeout**  
Provide a local definition of [Timeout](#) for backward compatibility.

### Public Member Functions

- [l4\\_kernel\\_clock\\_t](#) **next\_timeout** () const  
Get the time for the next timeout.
- bool **timeout\_expired** ([l4\\_kernel\\_clock\\_t](#) now) const  
Determine if a timeout has happened.
- void **handle\_expired\_timeouts** ([l4\\_kernel\\_clock\\_t](#) now)  
run the callbacks of expired timeouts
- void **add** ([Timeout](#) \*timeout, [l4\\_kernel\\_clock\\_t](#) time)  
Add a timeout to the queue.
- void **remove** ([Timeout](#) \*timeout)  
Remove timeout from the queue.

### 15.167.1 Detailed Description

[Timeout](#) queue to be used in l4re server loop.

Definition at line 65 of file [ipc\\_timeout\\_queue](#).

## 15.167.2 Member Function Documentation

### 15.167.2.1 add()

```
void L4::Ipc_svr::Timeout_queue::add (
    Timeout * timeout,
    l4_kernel_clock_t time ) [inline]
```

Add a timeout to the queue.

#### Parameters

<i>timeout</i>	timeout object to add
<i>time</i>	the time when the timeout expires

#### Precondition

*timeout* must not be in any queue already

Definition at line 121 of file [ipc\\_timeout\\_queue](#).

References [cxx::Bits::Basic\\_list< POLICY >::begin\(\)](#), [cxx::Bits::Basic\\_list< POLICY >::end\(\)](#), and [cxx::H\\_list< T, POLICY >::insert\\_](#)

Here is the caller graph for this function:

### 15.167.2.4 remove()

```
void L4::Ipc_svr::Timeout_queue::remove (
    Timeout * timeout ) [inline]
```

Remove *timeout* from the queue.

## Parameters

<i>timeout</i>	timeout to remove from timeout queue
----------------	--------------------------------------

## Precondition

*timeout* must be in this queue

Definition at line 136 of file `ipc_timeout_queue`.

References `cxx::H_list< T, POLICY >::remove()`.

Referenced by `L4::lpc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::remove_timeout()`.

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.167.2.5 timeout\_expired()

```
bool L4::Ipc_svr::Timeout_queue::timeout_expired (
    l4_kernel_clock_t now ) const [inline]
```

Determine if a timeout has happened.

## Parameters

<i>now</i>	The current time.
------------	-------------------

## Return values

<code>true</code>	There is at least one expired timeout in the queue.
<code>false</code>	No expired timeout in the queue.

Definition at line 91 of file [ipc\\_timeout\\_queue](#).

References [next\\_timeout\(\)](#).

### 15.168.1 Detailed Description

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
class L4::lpc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >
```

Loop hooks mixin for integrating a timeout queue into the server loop.

## Template Parameters

<i>HOOKS</i>	has to inherit from Timeout_queue_hooks<> and provide the functions now() that has to return the current time.
<i>BR_MAN</i>	This used as a base class for and provides the API for selecting the buffer register (BR) that is used to store the timeout value. This is usually <a href="#">L4Re::Util::Br_manager</a> or <a href="#">L4::lpc_svr::Br_manager_no_buffers</a> .

Definition at line 160 of file [ipc\\_timeout\\_queue](#).

## 15.168.2 Member Function Documentation

### 15.168.2.1 add\_timeout()

```
template<typename HOOKS , typename BR_MAN = Br_manager_no_buffers>
int L4::lpc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::add_timeout (
    Timeout * timeout,
    l4_kernel_clock_t time ) [inline], [override], [virtual]
```

Add a timeout to the queue for time *time*.

## Parameters

<i>timeout</i>	The timeout object to add into the queue (must not be in any queue currently).
<i>time</i>	The time when the timeout shall expire.

## Precondition

*timeout* must not be in any queue.

## Note

The timeout is automatically dequeued before the [Timeout::expired\(\)](#) function is called

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 212 of file [ipc\\_timeout\\_queue](#).

References [L4::lpc\\_svr::Timeout\\_queue::add\(\)](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >::queue](#), and [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >::timeout\(\)](#).

Here is the call graph for this function:

### 15.168.2.2 remove\_timeout()

```

template<typename HOOKS , typename BR_MAN = Br_manager_no_buffers>
int L4::ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::remove_timeout (
    Timeout * timeout ) [inline], [override], [virtual]
  
```

Remove timeout from the queue.

#### Parameters

<i>timeout</i>	The timeout object to be removed from the queue.
----------------	--

#### Note

This function may be safely called even if the timeout is not currently enqueued.

in [Timeout::expired\(\)](#) the timeout is already dequeued!

Implements [L4::ipc\\_svr::Server\\_iface](#).

Definition at line 225 of file [ipc\\_timeout\\_queue](#).

References [L4::ipc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >::queue](#), [L4::ipc\\_svr::Timeout\\_queue::remove\(\)](#), and [L4::ipc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >::timeout\(\)](#).

*Helper to check for protocol conflicts.*

**15.169.1 Detailed Description**

C++ [Irq](#) interface, see [IRQs](#) for the C interface.

**Note**

"IRQ" is short for "interrupt request". This is often used interchangeably for "interrupt"

The [Irq](#) class provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via the inherited method [L4::Triggerable::trigger\(\)](#).

For hardware and virtual device interrupts the [Irq](#) object must be bound to an interrupt source, see [L4::Icu](#). To receive interrupts, the [Irq](#) object must be bound to a thread, see [L4::Rcv\\_endpoint](#).

[Irq](#) objects can be created using a factory, see the [L4::Factory](#) API ([L4::Factory::create\(\)](#)).

**Include File**

```
#include <l4/sys/irq>
```

For the C interface refer to the [IRQs](#) API for an overview.

**Examples**

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#).

Definition at line 131 of file [irq](#).

**15.169.2 Member Function Documentation****15.169.2.1 detach()**

```
l4\_msgtag\_t L4::Irq::detach (
    l4\_utcb\_t * utcb = l4\_utcb\(\) ) [inline], [noexcept]
```

Detach from this interrupt.

## Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------	--

## Returns

Syscall return tag

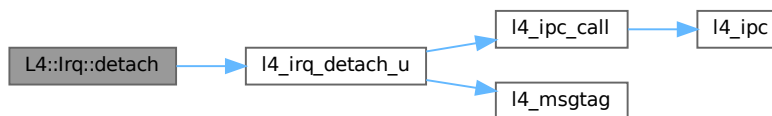

## Return values

<i>0</i>	Successfully detached, there was no interrupt pending.
<i>1</i>	Successfully detached, there was an interrupt pending.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> rights on the capability used to invoke this operation.

Definition at line 148 of file [irq](#).

References [l4\\_irq\\_detach\\_u\(\)](#).

Here is the call graph for this function:

## 15.169.2.2 receive()

```

l4_msgtag_t L4::Irq::receive (
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]

```

Unmask and wait for this IRQ.

## Parameters

<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag

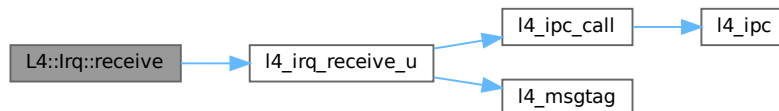

**Note**

If this is the function normally used for your IRQs consider using [L4::Semaphore](#) instead of [L4::Irq](#).

Definition at line 163 of file [irq](#).

References [l4\\_irq\\_receive\\_u\(\)](#).

Here is the call graph for this function:

**15.169.2.3 unmask()**

```

l4_msgtag_t L4::Irq::unmask (
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Unmask this IRQ.

**Parameters**

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------	--

**Returns**

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

[Irq::wait\(\)](#) and [Irq::receive\(\)](#) operations already include an [unmask\(\)](#), do not use an extra [unmask\(\)](#) in these cases.

Definition at line 193 of file [irq](#).

References [L4\\_IPC\\_NEVER](#), and [unmask\(\)](#).

Referenced by [unmask\(\)](#), and [wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.169.2.4 wait()

```

l4_msgtag_t L4::Irq::wait (
    l4_umword_t * label,
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Unmask IRQ and (open) wait for any message.

##### Parameters

<i>label</i>	The <i>protected label</i> shall be received here.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

Definition at line [176](#) of file [irq](#).

References [unmask\(\)](#).

Here is the call graph for this function:

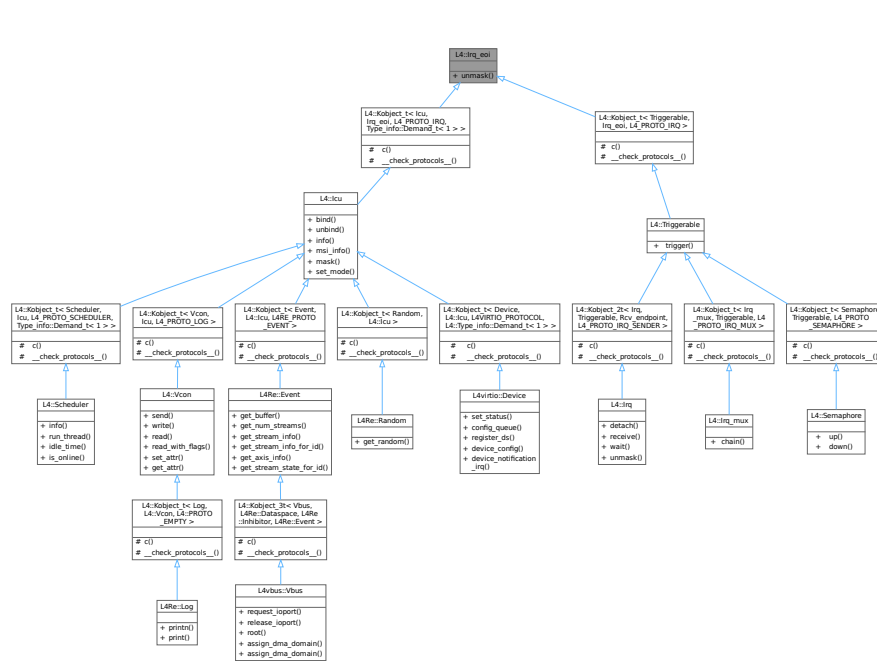

The documentation for this class was generated from the following file:

- [l4/sys/irq](#)

Interface for sending an unmask message to an object.

Inheritance diagram for L4::lrq\_eoi:

Collaboration diagram for L4::Irq\_eoi:

- `l4_msgtag_t unmask` (unsigned irqnum, `l4_umword_t` \*label=0, `l4_timeout_t` to=L4\_IPC\_NEVER, `l4_utcb_t` \*utcb=l4\_utcb()) noexcept

*Unmask the given interrupt line.*

### 15.170.1 Detailed Description

Interface for sending an unmask message to an object.

The object is usually an ICU or an IRQ.

When the kernel receives an IRQ, it masks the interrupt line at the interrupt controller and immediately acknowledges the interrupt. This interface is used to let the kernel know that userspace has dealt with the IRQ. The kernel will unmask the interrupt line and further IRQs can then be delivered.

See also

[L4::lcu](#), [L4::irq](#)

Definition at line 48 of file [irq](#).

### 15.170.2 Member Function Documentation

#### 15.170.2.1 unmask()

```
l4_msgtag_t L4::Irq_eoi::unmask (
    unsigned irqnum,
    l4_umword_t * label = 0,
    l4_timeout_t to = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Unmask the given interrupt line.

When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.

Its counterpart for explicitly masking an interrupt line is [L4::lcu::mask\(\)](#).

Parameters

	<i>irqnum</i>	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
out	<i>label</i>	If NULL, this is a send-only unmask. If not NULL, this operation enters an open wait and the <i>protected label</i> shall be received here.
	<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Returns

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 75 of file [irq](#).

### 15.172.1 Detailed Description

IRQ multiplexer for shared IRQs.

**Deprecated** IRQ muxer objects are no longer supported by the kernel.

This interface allows broadcasting of shared IRQs to multiple triggerables. The IRQ multiplexer is responsible for the correct mask and unmask logic for such shared IRQs.

The semantics are that each of the slave IRQs is triggered whenever the multiplexer IRQ is triggered. As shared IRQs are usually level-triggered, the real IRQ source will be masked automatically when an IRQ is delivered and shall be unmasked when all attached slave IRQs are unmasked.

Definition at line 212 of file [irq](#).

### 15.172.2 Member Function Documentation

#### 15.172.2.1 `chain()`

```
l4_msgtag_t L4::Irq_mux::chain (
    Cap< Triggerable > const & slave,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Attach an IRQ to this multiplexer.

##### Parameters

<i>slave</i>	The slave that shall be attached to the master.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

The chaining feature of IRQ objects allows to deal with shared IRQs. For chaining IRQs there must be an IRQ multiplexer ([Irq\\_mux](#)) bound to the real IRQ source. This function allows to add slave IRQs to this multiplexer.

Definition at line 227 of file [irq](#).

## 15.173.1 Detailed Description

```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
struct L4::Irqep_t< Derived, BASE, bool >
```

**Epiface** implementation for interrupt handlers.

### Template Parameters

<i>Derived</i>	<b>Irq</b> handler implementation class. The class must provide a single function <code>handle_irq()</code> .
<i>BASE</i>	Base <b>Epiface</b> class.

Definition at line 293 of file `ipc_epiface`.

## 15.173.2 Member Function Documentation

### 15.173.2.1 dispatch()

```
template<typename Derived , typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
l4_msgtag_t L4::Irqep_t< Derived, BASE, bool >::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb ) [inline], [final], [virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt;0</code>	Error, reply with error code.
<code>&gt;=0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implements [L4::Epiface](#).

Definition at line 295 of file [ipc\\_epiface](#).

References [L4\\_ENOREPLY](#), and [l4\\_msgtag\(\)](#).

Here is the call graph for this function:

### 15.173.2.2 obj\_cap()

```
template<typename Derived , typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
Cap< L4::Irq > L4::Irqep_t< Derived, BASE, bool >::obj_cap ( ) const [inline]
```

Get the (typed) capability to this object.

**Returns**

[lirq](#) capability for the kernel object behind the server.

Definition at line 305 of file [ipc\\_epiface](#).

The documentation for this struct was generated from the following file:

### 15.174.1 Detailed Description

Memory descriptors stored in the kernel interface page.

#### Include File

```
#include <l4/sys/kip>
```

Definition at line 53 of file `kip`.

### 15.174.2 Member Enumeration Documentation

#### 15.174.2.1 Arch\_sub\_type\_common

```
enum L4::Kip::Mem_desc::Arch_sub_type_common
```

Common sub types across all architectures for the `Mem_type::Arch` type.

## Enumerator

Arch_acpi_tables	Firmware ACPI tables.
Arch_acpi_nvs	Firmware reserved address space.

Definition at line 83 of file [kip](#).

### 15.174.2.2 Info\_sub\_type

```
enum L4::Kip::Mem_desc::Info_sub_type
```

Memory sub types for the [Mem\\_type::Info](#) type.

## Enumerator

Info_acpi_rsdp	Physical address of the ACPI root pointer.
----------------	--

Definition at line 75 of file [kip](#).

### 15.174.2.3 Mem\_type

```
enum L4::Kip::Mem_desc::Mem_type
```

Memory types.

## Enumerator

Undefined	Undefined memory.
Conventional	Conventional memory.
Reserved	Reserved region, do not use this memory.
Dedicated	Dedicated.
Shared	Shared.
Info	Info by boot loader.
Bootloader	Memory belongs to the boot loader.
Arch	Architecture specific memory.

Definition at line 59 of file [kip](#).

## 15.174.3 Constructor & Destructor Documentation

### 15.174.3.1 Mem\_desc()

```
L4::Kip::Mem_desc::Mem_desc (
    unsigned long start,
    unsigned long end,
    Mem_type t,
```

```

    unsigned char st = 0,
    bool virt = false,
    bool eager = false ) [inline], [noexcept]

```

Initialize memory descriptor.

#### Parameters

<i>start</i>	Start address
<i>end</i>	End address
<i>t</i>	Memory type
<i>st</i>	Memory subtype, defaults to 0
<i>virt</i>	True for virtual memory, false for physical memory, defaults to physical
<i>eager</i>	The region shall be eligible for eager mapping in sigma0 or the root task. This is just an optimization to prevent on-demand paging.

Definition at line 179 of file [kip](#).

## 15.174.4 Member Function Documentation

### 15.174.4.1 all() [1/2]

```

static cxx::static_vector< Mem_desc > L4::Kip::Mem_desc::all (
    void * kip ) [inline], [static]

```

Return enumerable list of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page.
------------	----------------------------------

Definition at line 160 of file [kip](#).

References [count\(\)](#), and [first\(\)](#).

Here is the call graph for this function:

### 15.174.4.2 all() [2/2]

```
static cxx::static_vector< Mem_desc const > L4::Kip::Mem_desc::all (
    void const * kip ) [inline], [static]
```

Return enumerable list of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page.
------------	----------------------------------

Definition at line 149 of file [kip](#).

References [count\(\)](#), and [first\(\)](#).

Here is the call graph for this function:

### 15.174.4.3 count() [1/2]

```
static void L4::Kip::Mem_desc::count (
    void * kip,
    unsigned count ) [inline], [static], [noexcept]
```

Set number of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page
<i>count</i>	Number of memory descriptors

Definition at line 138 of file [kip](#).

References [count\(\)](#).

Here is the call graph for this function:

#### 15.174.4.4 count() [2/2]

```
static unsigned long L4::Kip::Mem_desc::count (
    void const * kip ) [inline], [static], [noexcept]
```

Return number of memory descriptors stored in the kernel info page.

##### Parameters

<i>kip</i>	Pointer to the kernel info page
------------	---------------------------------

##### Returns

Number of memory descriptors in the kernel info page.

Definition at line 126 of file [kip](#).

Referenced by [all\(\)](#), [all\(\)](#), and [count\(\)](#).

Here is the caller graph for this function:

#### 15.174.4.5 end()

```
unsigned long L4::Kip::Mem_desc::end ( ) const [inline], [noexcept]
```

Return end address of memory descriptor.

##### Returns

End address of memory descriptor

Definition at line 198 of file [kip](#).

Referenced by [set\(\)](#), and [size\(\)](#).

Here is the caller graph for this function:

#### 15.174.4.6 first()

```
static Mem_desc * L4::Kip::Mem_desc::first (
    void * kip ) [inline], [static], [noexcept]
```

Get first memory descriptor.

##### Parameters

<i>kip</i>	Pointer to the kernel info page
------------	---------------------------------

##### Returns

First memory descriptor stored in the kernel info page

Definition at line 106 of file [kip](#).

Referenced by [all\(\)](#), and [all\(\)](#).

Here is the caller graph for this function:

#### 15.174.4.7 is\_virtual()

```
unsigned L4::Kip::Mem_desc::is_virtual ( ) const [inline], [noexcept]
```

Return whether the memory descriptor describes a virtual or physical region.

##### Returns

True for virtual region, false for physical region.

Definition at line 230 of file [kip](#).

#### 15.174.4.8 set()

```
void L4::Kip::Mem_desc::set (
    unsigned long start,
    unsigned long end,
    Mem_type t,
    unsigned char st = 0,
    bool virt = false,
    bool eager = false ) [inline], [noexcept]
```

Set values of a memory descriptor.

##### Parameters

<i>start</i>	Start address
<i>end</i>	End address
<i>t</i>	Memory type
<i>st</i>	Sub-type, defaults to 0
<i>virt</i>	Virtual or physical memory region, defaults to physical
<i>eager</i>	The region shall be eligible for eager mapping in sigma0 or the root task. This is just an optimization to prevent on-demand paging.

Definition at line 250 of file [kip](#).

References [end\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

#### 15.174.4.9 size()

```
unsigned long L4::Kip::Mem_desc::size ( ) const [inline], [noexcept]
```

Return size of region described by the memory descriptor.

##### Returns

Size of the region described by the memory descriptor

Definition at line [205](#) of file [kip](#).

References [end\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

#### 15.174.4.10 start()

```
unsigned long L4::Kip::Mem_desc::start ( ) const [inline], [noexcept]
```

Return start address of memory descriptor.

##### Returns

Start address of memory descriptor

Definition at line 191 of file [kip](#).

Referenced by [set\(\)](#), and [size\(\)](#).

Here is the caller graph for this function:

#### 15.174.4.11 sub\_type()

```
unsigned char L4::Kip::Mem_desc::sub_type ( ) const [inline], [noexcept]
```

Return sub-type of the memory descriptor.

##### Returns

Sub-type of the memory descriptor

Definition at line 222 of file [kip](#).

#### 15.174.4.12 type()

```
Mem\_type L4::Kip::Mem_desc::type ( ) const [inline], [noexcept]
```

Return type of the memory descriptor.

##### Returns

Type of the memory descriptor

Definition at line 212 of file [kip](#).

The documentation for this class was generated from the following file:

- [l4/sys/kip](#)

## 15.175 L4::Kobject Class Reference

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.

```
#include <kobject>
```

Inheritance diagram for L4::Kobject:

Collaboration diagram for L4::Kobject:

### Public Member Functions

- [l4\\_msgtag\\_t dec\\_refcnt](#) ([l4\\_mword\\_t diff](#), [l4\\_utcb\\_t \\*utcb=l4\\_utcb\(\)](#))  
*Decrement the in kernel reference counter for the object.*

### Protected Member Functions

- [l4\\_cap\\_idx\\_t cap](#) () const noexcept  
*Return capability selector.*

### 15.175.1 Detailed Description

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.

#### Include File

```
#include <l4/sys/capability>
```

This is the base class for all remote objects accessible using RPC. However, subclasses do not directly inherit from [L4::Kobject](#) but *must* use [L4::Kobject\\_t](#) ([L4::Kobject\\_0t](#), [L4::Kobject\\_2t](#), [L4::Kobject\\_3t](#), or [L4::Kobject\\_x](#)) for inheritance, otherwise these classes cannot be used as RPC interfaces.

#### Attention

Objects derived from [Kobject](#) *must* never add any data to those objects. Kobjects can act only as proxy object for encapsulating object invocations.

Definition at line 46 of file [kobject](#).

## 15.175.2 Member Function Documentation

### 15.175.2.1 cap()

```
l4_cap_idx_t L4::Kobject::cap ( ) const [inline], [protected], [noexcept]
```

Return capability selector.

#### Returns

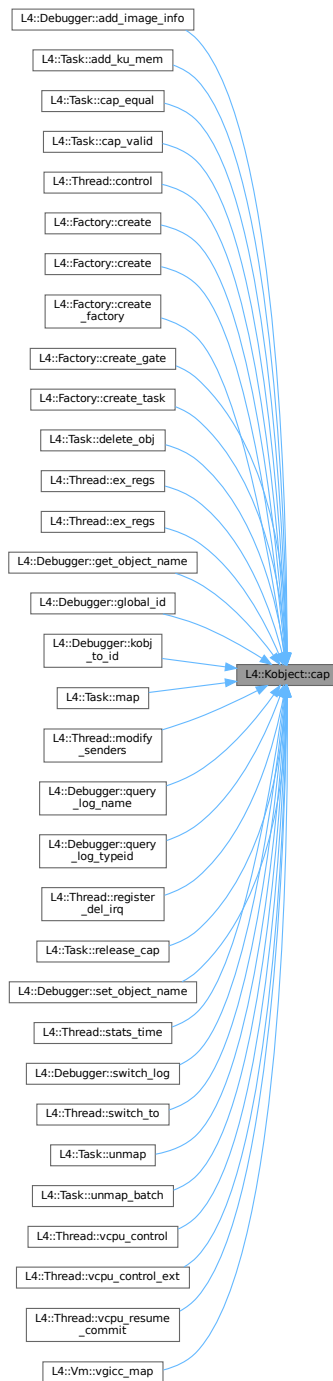

Capability selector.

This method is for derived classes to gain access to the actual capability selector.

Definition at line 79 of file [kobject](#).

Referenced by [L4::Debugger::add\\_image\\_info\(\)](#), [L4::Task::add\\_ku\\_mem\(\)](#), [L4::Task::cap\\_equal\(\)](#), [L4::Task::cap\\_valid\(\)](#), [L4::Thread::control\(\)](#), [L4::Factory::create\(\)](#), [L4::Factory::create\(\)](#), [L4::Factory::create\\_factory\(\)](#), [L4::Factory::create\\_gate\(\)](#), [L4::Factory::create\\_task\(\)](#), [L4::Task::delete\\_obj\(\)](#), [L4::Thread::ex\\_regs\(\)](#), [L4::Thread::ex\\_regs\(\)](#), [L4::Debugger::get\\_object\\_name\(\)](#), [L4::Debugger::global\\_id\(\)](#), [L4::Debugger::kobj\\_to\\_id\(\)](#), [L4::Task::map\(\)](#), [L4::Thread::modify\\_senders\(\)](#), [L4::Debugger::query\\_log\\_name\(\)](#), [L4::Debugger::query\\_log\\_typeid\(\)](#), [L4::Thread::register\\_del\\_irq\(\)](#), [L4::Task::release\\_cap\(\)](#), [L4::Debugger::set\\_object\\_name\(\)](#), [L4::Thread::stats\\_time\(\)](#), [L4::Debugger::switch\\_log\(\)](#), [L4::Thread::switch\\_to\(\)](#), [L4::Task::unmap\(\)](#), [L4::Task::unmap\\_batch\(\)](#), [L4::Thread::vcpu\\_control\(\)](#), [L4::Thread::vcpu\\_control\\_ext\(\)](#), [L4::Thread::vcpu\\_resume\\_commit\(\)](#), and [L4::Vm::vgicc\\_map\(\)](#).

Here is the caller graph for this function:

### 15.175.2.2 dec\_refcnt()

```

14_msgtag_t L4::Kobject::dec_refcnt (
    14_mword_t diff,
    14_utcb_t * utcb = 14_utcb() ) [inline]
  
```

Decrement the in kernel reference counter for the object.

## Parameters

<i>diff</i>	The delta that shall be subtracted from the reference count.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag

This function is intended for servers to be able to remove the servers own capability from the counted references. This leads to the semantics that the kernel will delete the object even if the capability of the server is valid. The server can detect the deletion by polling its capabilities or by using the IPC-gate deletion IRQs. And to cleanup if the clients dropped the last reference (capability) to the object.

This function only succeeds on a kernel object of type [L4::lpc\\_gate](#) which has the server right ([L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#)). For other kernel objects, -L4\_ENOSYS is returned.

Definition at line 110 of file [kobject](#).

## 15.176.1 Detailed Description

```

template<typename Derived, typename Base1, typename Base2, long PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
class L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >
  
```

Helper class to create an [L4Re](#) interface class that is derived from two base classes (see [L4::Kobject\\_t](#)).

### Template Parameters

<i>Derived</i>	is the name of the new interface.
<i>Base1</i>	is the name of the interface's first base class.
<i>Base2</i>	is the name of the interface's second base class.
<i>PROTO</i>	may be set to the statically assigned protocol number used to communicate with this interface.
<i>S_DEMAND</i>	type defining the demand of server-side resources for this interface, usually a <a href="#">L4::Type_info::Demand_t</a> . This value must describe the server-side resources needed by the interface itself, the resource demand of the base interfaces (Base1 and Base2) are automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface `My_iface` that is derived from `L4::Icu` and `L4Re::Dataspace`.

```
class My_iface : public L4::Kobject_2t<My_iface, L4::Icu, L4Re::Dataspace>
{
    ...
};
```

Definition at line 838 of file `__typeinfo.h`.

## 15.176.2 Member Typedef Documentation

### 15.176.2.1 `__Iface`

```
template<typename Derived , typename Base1 , typename Base2 , long PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
typedef Typeid::Iface<PROTO, Derived> L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND
>::__Iface [protected]
```

The interface description for the derived class.

Definition at line 844 of file `__typeinfo.h`.

### 15.176.2.2 `__Iface_list`

```
template<typename Derived , typename Base1 , typename Base2 , long PROTO = PROTO_ANY, typename

#### 15.179.1 Detailed Description

```
template<typename Derived, typename Base, long PROTO = PROTO_ANY, typename S_DEMAND = Type_
_info::Demand_t<>>
class L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >
```

Helper class to create an [L4Re](#) interface class that is derived from a single base class.

#### Template Parameters

<i>Derived</i>	is the name of the new interface.
<i>Base</i>	is the name of the interfaces single base class.
<i>PROTO</i>	may be set to the statically assigned protocol number used to communicate with this interface.
<i>S_DEMAND</i>	type defining the demand on server-side resources for this interface, usually a <a href="#">L4::Type_info::Demand_t</a> . This value must describe the server-side resources needed by the interface itself, the resource demand of the base interface <i>Base</i> is automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface `My_iface` that is derived from [L4::Kobject](#).

```
class My_iface : public L4::Kobject_t<My_iface, L4::Kobject>
{
    ...
};
```

Definition at line 760 of file [\\_\\_typeinfo.h](#).

The documentation for this class was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.180 L4::Kobject\_typeid< T > Struct Template Reference

[Meta](#) object for handling access to type information of Kobjects.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Kobject\_typeid< T >:

## Public Types

- typedef T::\_\_Kobject\_typeid::Demand [Demand](#)

*Data type expressing the static demand of receive buffers in a server.*

## Static Public Member Functions

- static [Type\\_info](#) const \* [id](#) () noexcept  
*Get a pointer to the [Kobject](#) type information of T.*
- static [Type\\_info::Demand](#) [demand](#) () noexcept  
*Get the receive-buffer demand for the server providing the interface T.*
- template<typename THIS , typename A1 , typename A2 >  
static int [proto\\_dispatch](#) (THIS \*self, long proto, A1 a1, A2 &a2)  
*Protocol based server-side dispatch function.*

### 15.180.1 Detailed Description

```
template<typename T>
struct L4::Kobject_typeid< T >
```

[Meta](#) object for handling access to type information of Kobjects.

#### Template Parameters

<a href="#">T</a>	The data type derived from <a href="#">Kobject</a> , usually using <a href="#">Kobject_t</a> .
-------------------	--

Definition at line 621 of file [\\_\\_typeinfo.h](#).

### 15.180.2 Member Typedef Documentation

#### 15.180.2.1 Demand

```
template<typename T >
typedef T::__Kobject_typeid::Demand L4::Kobject\_typeid< T >::Demand
```

Data type expressing the static demand of receive buffers in a server.

This information is the combined demand of all base interfaces for T and the buffer demand of T itself. The buffer demand of T is usually specified as the S\_DEMAND argument of the [Kobject\\_t](#) or [Kobject\\_2t](#) inheritance helpers. S\_DEMAND is usually of type [L4::Type\\_info::Demand\\_t](#), or [L4::Type\\_info::Demand\\_union\\_t](#).

Definition at line 633 of file [\\_\\_typeinfo.h](#).

### 15.180.3 Member Function Documentation

#### 15.180.3.1 demand()

```
template<typename T >
static Type_info::Demand L4::Kobject_typeid< T >::demand ( ) [inline], [static], [noexcept]
```

Get the receive-buffer demand for the server providing the interface T.

##### Returns

A demand value describing the minimum receive buffers needed for handling server side requests for interface T.

Definition at line 650 of file [\\_\\_typeinfo.h](#).

#### 15.180.3.2 id()

```
template<typename T >
static Type_info const * L4::Kobject_typeid< T >::id ( ) [inline], [static], [noexcept]
```

Get a pointer to the [Kobject](#) type information of T.

##### Returns

a pointer to the [Kobject](#) typeinfo of T.

Definition at line 641 of file [\\_\\_typeinfo.h](#).

Referenced by [L4::kobject\\_typeid\(\)](#).

Here is the caller graph for this function:

#### 15.180.3.3 proto\_dispatch()

```
template<typename T >
template<typename THIS , typename A1 , typename A2 >
static int L4::Kobject_typeid< T >::proto_dispatch (
    THIS * self,
    long proto,
    A1 a1,
    A2 & a2 ) [inline], [static]
```

Protocol based server-side dispatch function.

## Template Parameters

<i>THIS</i>	Data type of the server-side object implementing the interface T.
<i>A1</i>	Data type of second argument for p_dispatch()
<i>A2</i>	Data type of third argument for p_dispatch()

## Parameters

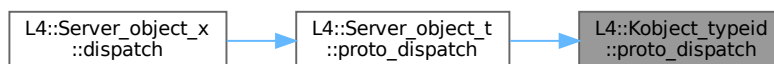

<i>self</i>	The pointer to the server object
<i>proto</i>	The protocol number used by the caller
<i>a1</i>	The second argument passed to self->p_dispatch()
<i>a2</i>	The third argument passed to self->p_dispatch()

This function forwards the call to the overloaded p\_dispatch() function of self. The data type of the first argument for p\_dispatch is determined by the given protocol number.

Definition at line 671 of file [\\_\\_typeinfo.h](#).

Referenced by [L4::Server\\_object\\_t< IFACE, BASE >::proto\\_dispatch\(\)](#).

Here is the caller graph for this function:

### 15.182.1 Detailed Description

```
template<typename Derived, typename ... ARGS>
struct L4::Kobject_x< Derived, ARGS >
```

Generic [Kobject](#) inheritance template.

#### Template Parameters

<i>Derived</i>	The class name that derives from <a href="#">Kobject_x</a> .
<i>ARGS</i>	An optional protocol number via <a href="#">L4::Proto_t</a> , followed by an optional server-side requirement passed as <a href="#">L4::Type_info::Demand_t</a> , followed by the list of base classes.

Definition at line [1208](#) of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

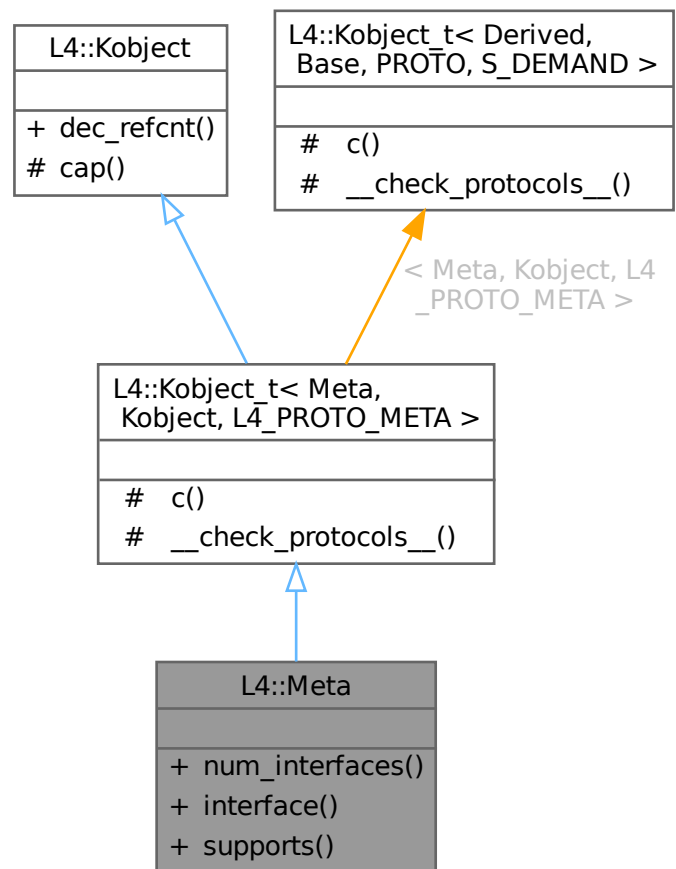

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.183 L4::Meta Class Reference

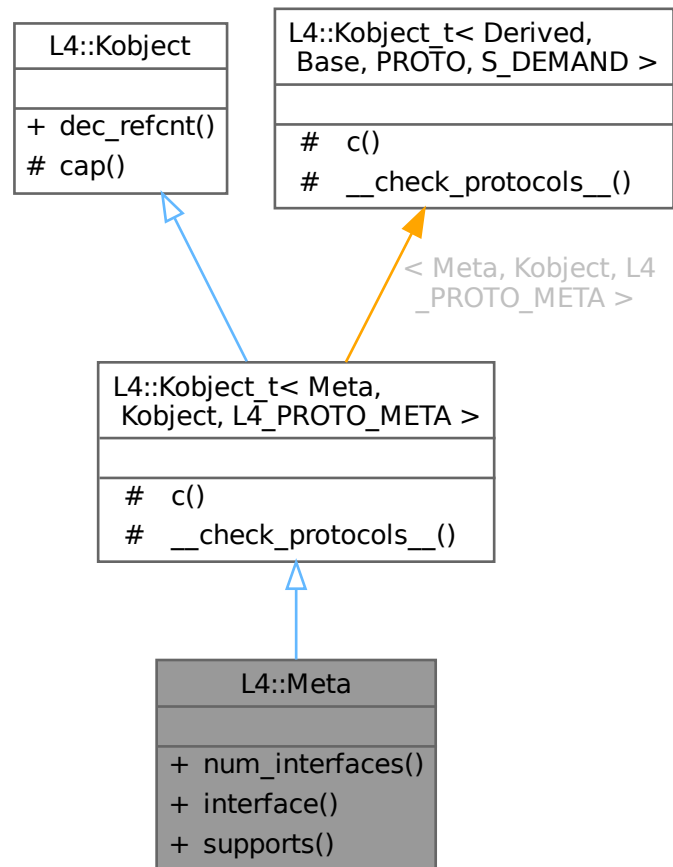

[Meta](#) interface that shall be implemented by each [L4Re](#) object and gives access to the dynamic type information for [L4Re](#) objects.

```
#include <meta>
```

Inheritance diagram for L4::Meta:

Collaboration diagram for L4::Meta:

## Public Member Functions

- [l4\\_msgtag\\_t num\\_interfaces \(\)](#)  
Get the number of interfaces implemented by this object.
- [l4\\_msgtag\\_t interface \(l4\\_umword\\_t idx, long \\*proto, L4::lpc::String< char > \\*name\)](#)  
Get the protocol number that must be used for the interface with the number *idx*.
- [l4\\_msgtag\\_t supports \(l4\\_mword\\_t protocol\)](#)  
Figure out if the object supports the given protocol (number).

## Public Member Functions inherited from [L4::Kobject](#)

- [l4\\_msgtag\\_t dec\\_refcnt \(l4\\_mword\\_t diff, l4\\_utcb\\_t \\*utcb=l4\\_utcb\(\)\)](#)  
Decrement the in kernel reference counter for the object.

## Additional Inherited Members

### Protected Types inherited from [L4::Kobject\\_t< Meta, Kobject, L4\\_PROTO\\_META >](#)

- typedef [Meta](#) **Class**  
*The target interface type (inheriting from [Kobject\\_t](#))*
- typedef Typeid::Iface< PROTO, [Meta](#) > **\_\_Iface**  
*The interface description for the derived class.*
- typedef Typeid::Merge\_list< Typeid::Iface\_list< **\_\_Iface** >, typename Base::\_\_Iface\_list > **\_\_Iface\_list**  
*The list of all RPC interfaces provided directly or through inheritance.*

### Protected Member Functions inherited from [L4::Kobject\\_t< Meta, Kobject, L4\\_PROTO\\_META >](#)

- [L4::Cap< Class > c](#) () const noexcept  
*Get the capability to ourselves.*

### Protected Member Functions inherited from [L4::Kobject](#)

- [l4\\_cap\\_idx\\_t](#) [cap](#) () const noexcept  
*Return capability selector.*

### Static Protected Member Functions inherited from [L4::Kobject\\_t< Meta, Kobject, L4\\_PROTO\\_META >](#)

*Helper to check for protocol conflicts.*

## 15.183.1 Detailed Description

[Meta](#) interface that shall be implemented by each [L4Re](#) object and gives access to the dynamic type information for [L4Re](#) objects.

Definition at line 37 of file [meta](#).

## 15.183.2 Member Function Documentation

### 15.183.2.1 interface()

```
l4\_msgtag\_t L4::Meta::interface (
    l4\_umword\_t idx,
    long * proto,
    L4::Ipc::String< char > * name )
```

Get the protocol number that must be used for the interface with the number *idx*.

## Parameters

	<i>idx</i>	The index of the interface to get the protocol number for. <i>idx</i> must be $\geq 0$ and $<$ the return value of <a href="#">num_interfaces()</a> .
out	<i>proto</i>	The protocol number for interface <i>idx</i> .
out	<i>name</i>	The protocol name for interface <i>idx</i> .

## Return values

<i>l4_msgtag_t::label()</i> == 0	Successful; see `proto` and `name`.
<i>l4_msgtag_t::label()</i> < 0	Error code.

**15.183.2.2 num\_interfaces()**

```
l4_msgtag_t L4::Meta::num_interfaces ( )
```

Get the number of interfaces implemented by this object.

## Return values

<i>l4_msgtag_t::label()</i> $\geq 0$	The number of supported interfaces.
<i>l4_msgtag_t::label()</i> < 0	Error code of the occurred error.

**15.183.2.3 supports()**

```
l4_msgtag_t L4::Meta::supports (
    l4_mword_t protocol )
```

Figure out if the object supports the given protocol (number).

## Parameters

<i>protocol</i>	The protocol number to check for.
-----------------	-----------------------------------

## Return values

<i>l4_msgtag_t::label()</i> == 1	protocol is supported.
<i>l4_msgtag_t::label()</i> == 0	protocol is not supported.

This method is intended to be used for statically assigned protocol numbers.

The documentation for this class was generated from the following file:

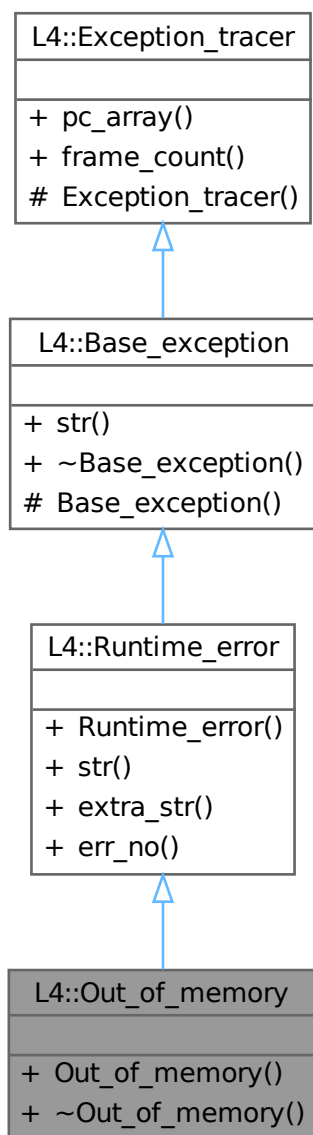

- [l4/sys/meta](#)

## 15.184 L4::Out\_of\_memory Class Reference

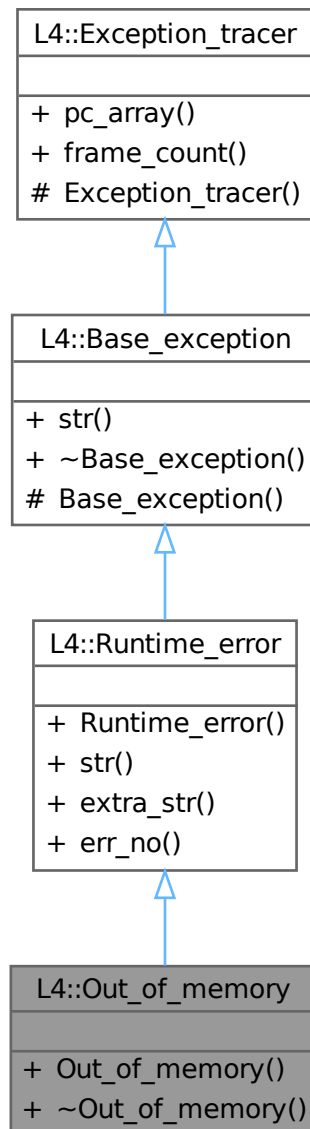

[Exception](#) signalling insufficient memory.

```
#include <l4/cxx/exceptions>
```

## Protected Member Functions inherited from [L4::Kobject\\_t<Pager, lo\\_pager, L4\\_PROTO\\_PAGE\\_FAULT>](#)

- [L4::Cap<Class>c\(\)](#) const noexcept  
*Get the capability to ourselves.*

## Static Protected Member Functions inherited from [L4::Kobject\\_t<Pager, lo\\_pager, L4\\_PROTO\\_PAGE\\_FAULT>](#)

- static void [\\_\\_check\\_protocols\\_\\_\(\)](#) noexcept  
*Helper to check for protocol conflicts.*

### 15.185.1 Detailed Description

[Pager](#) interface including the [lo\\_pager](#) interface.

This class defines the interface for handling page fault IPC. If a thread causes a page fault, the microkernel synthesises a page fault IPC message and sends it to the thread's page fault handler (pager). The pager can then handle the message, for example by establishing a suitable page mapping.

The page fault handler is set with the [L4::Thread::control](#) interface.

Definition at line 98 of file [pager](#).

### 15.185.2 Member Function Documentation

#### 15.185.2.1 [page\\_fault\(\)](#)

```
l4_msgtag_t L4::Pager::page_fault (
    l4_umword_t pfa,
    l4_umword_t pc,
    L4::Ipc::Rcv_fpage rwin,
    L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp )
```

Page-fault protocol message.

#### Parameters

	<i>pfa</i>	Faulting address including failure reason: bits [0:2].
	<i>pc</i>	Faulting program counter.
	<i>rwin</i>	Receive window for a flex-page mapping resolving the page fault.
out	<i>fp</i>	Optional: flex-page descriptor to send to the task raising the page fault.

#### Returns

System call message tag; use [l4\\_error\(\)](#) to check for errors.

Page-fault messages are usually generated by the kernel and need to be handled by an appropriate handler function, potentially filling in *fp* for the reply.

pfa encoding is as shown:

[63/31 .. 3]	2	1	0
PFA	X	W	r

- **PFA** Bits 63/31..3 of `pfa` are the page fault address bits 63/31 to 3, bits 2..0 are masked.
- **X** Bit 2 of `pfa` if set, indicates a page fault during instruction fetch. Note, this bit is implementation-defined and might always be clear. Therefore, if this bit is clear it does not imply that the page fault is not due to an instruction fetch.
- **W** Bit 1 of `pfa` is set to 1 for a page fault due to a write operation.
- **r** Bit0: reserved, undefined.

The documentation for this class was generated from the following file:

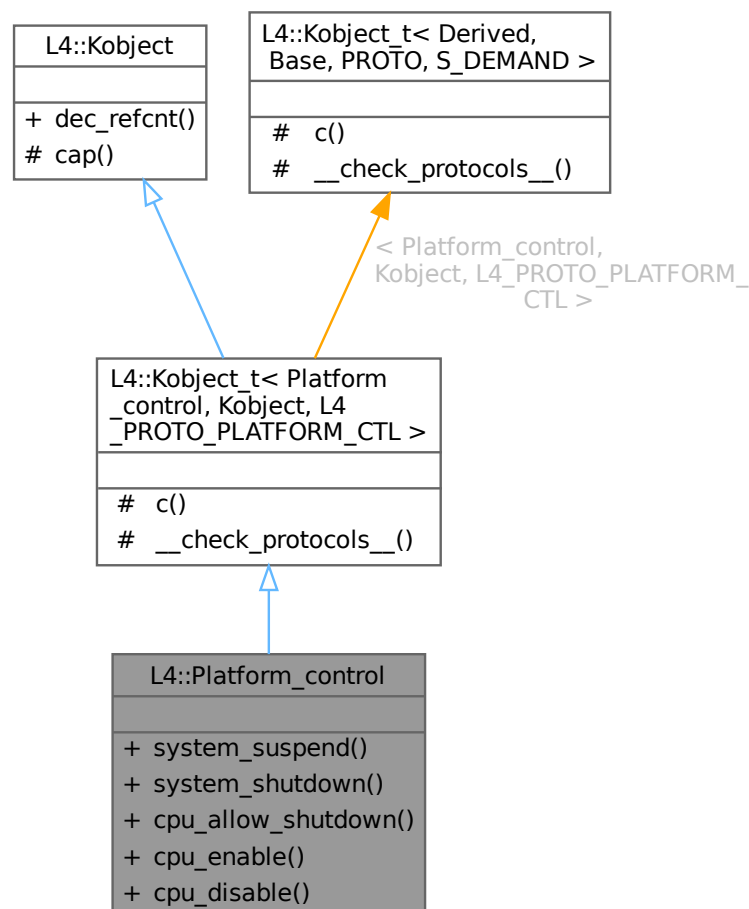

- [l4/sys/pager](#)

## 15.186 L4::Platform\_control Class Reference

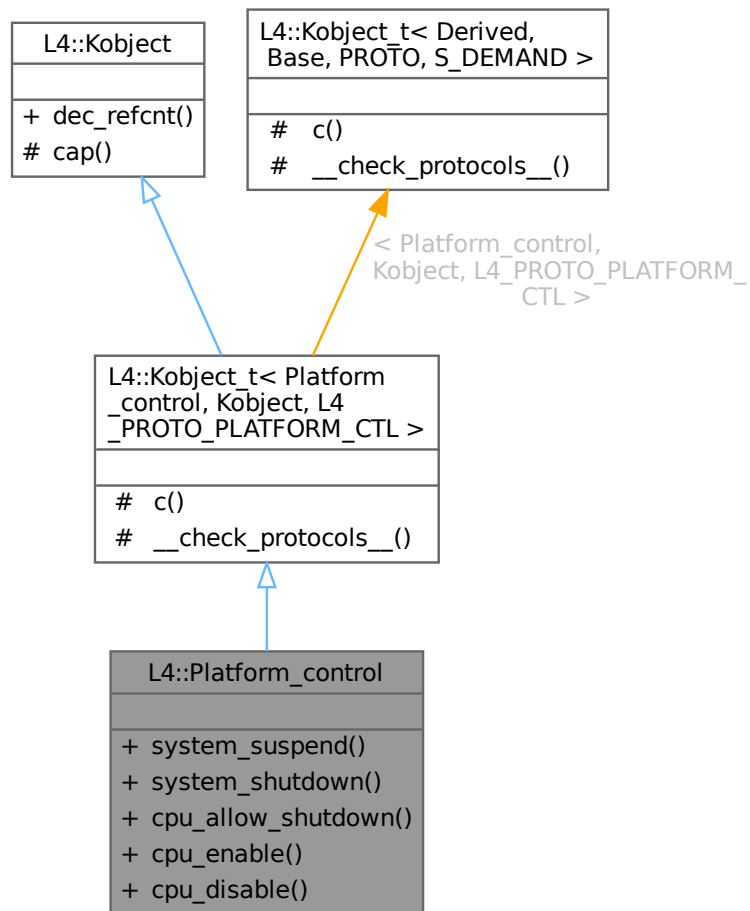

[L4](#) C++ interface for controlling platform-wide properties, see [Platform Control C API](#) for the C interface.

## 15.186.1 Detailed Description

[L4](#) C++ interface for controlling platform-wide properties, see [Platform Control C API](#) for the C interface.

Add

```
#include <l4/sys/platform_control>
```

to your code to use the platform control functions. The API allows a client to suspend, reboot or shutdown the system.

For the C interface refer to the [Platform Control C API](#).

Definition at line 47 of file [platform\\_control](#).

## 15.186.2 Member Function Documentation

### 15.186.2.1 [cpu\\_allow\\_shutdown\(\)](#)

```
l4\_msgtag\_t L4::Platform\_control::cpu\_allow\_shutdown (  
    l4\_umword\_t phys_id,  
    l4\_umword\_t enable )
```

Allow CPU shutdown.

## Parameters

<i>phys↔ _id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.
<i>enable</i>	Allow shutdown when 1, disallow when 0.

Sets or unsets a hint that a CPU that is not currently used may be powered down.

**15.186.2.2 cpu\_disable()**

```
l4_msgtag_t L4::Platform_control::cpu_disable (
    l4_umword_t phys_id )
```

Disable an online CPU.

## Parameters

<i>phys↔ _id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.
----------------------	---

## Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

**15.186.2.3 cpu\_enable()**

```
l4_msgtag_t L4::Platform_control::cpu_enable (
    l4_umword_t phys_id )
```

Enable an offline CPU.

## Parameters

<i>phys↔ _id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.
----------------------	--

## Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

**15.186.2.4 system\_shutdown()**

```
l4_msgtag_t L4::Platform_control::system_shutdown (
    l4_umword_t reboot )
```

Shutdown/Reboot the system.

## Parameters

<i>reboot</i>	1 for reboot, 0 for power off
---------------	-------------------------------

**15.186.2.5 system\_suspend()**

```
l4_msgtag_t L4::Platform_control::system_suspend (
    l4_umword_t extras )
```

Enter suspend to RAM.

## Precondition

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

## Parameters

<i>extras</i>	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the <a href="#">Platform_control</a> object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as Io's <a href="#">Platform_control</a> object don't make use of this value at the moment.
---------------	---

The documentation for this class was generated from the following file:

- [l4/sys/platform\\_control](#)

**15.187 L4::Poll\_timeout\_counter Class Reference**

Evaluate an expression for a maximum number of times.

```
#include <poll_timeout_counter.h>
```

Collaboration diagram for L4::Poll\_timeout\_counter:

L4::Poll_timeout_counter
<ul style="list-style-type: none"> <li>+ Poll_timeout_counter()</li> <li>+ set()</li> <li>+ test()</li> <li>+ timed_out()</li> </ul>

## Public Member Functions

- [Poll\\_timeout\\_counter](#) (unsigned counter\_val)  
*Constructor.*
- void [set](#) (unsigned counter\_val)  
*Set the counter to a certain value.*
- bool [test](#) (bool expression=true)  
*Evaluate the expression for a maximum number of times.*
- bool [timed\\_out](#) () const  
*Indicator if the maximum number of tests was required.*

### 15.187.1 Detailed Description

Evaluate an expression for a maximum number of times.

A typical use case is testing for a bit change in a hardware register for a maximum number of times (polling). For example:

```
{c++}
Mmio_register_block regs;
Poll_timeout_counter i(3000000);
while (i.test(!(regs.read<14_uint32_t>(0x04) & 1)))
;
```

The following usage is **wrong**:

```
{c++}
...
Poll_timeout_counter i(3000000);
while (!i.test((regs.read<14_uint32_t>(0x04) & 1)))
;
```

This loop would never terminate if the hardware register doesn't change!

Definition at line 36 of file [poll\\_timeout\\_counter.h](#).

### 15.187.2 Constructor & Destructor Documentation

#### 15.187.2.1 Poll\_timeout\_counter()

```
L4::Poll_timeout_counter::Poll_timeout_counter (
    unsigned counter_val ) [inline]
```

Constructor.

#### Parameters

<i>counter_val</i>	Maximum number of times to repeat the test.
--------------------	---

Definition at line 44 of file [poll\\_timeout\\_counter.h](#).

References [set\(\)](#).

Here is the call graph for this function:

## 15.187.3 Member Function Documentation

### 15.187.3.1 set()

```
void L4::Poll_timeout_counter::set (
    unsigned counter_val ) [inline]
```

Set the counter to a certain value.

#### Parameters

<i>counter_val</i>	New counter value for maximum number of times to repeat the test.
--------------------	---

Definition at line 55 of file [poll\\_timeout\\_counter.h](#).

Referenced by [Poll\\_timeout\\_counter\(\)](#).

Here is the caller graph for this function:

### 15.187.3.2 timed\_out()

```
bool L4::Poll_timeout_counter::timed_out ( ) const [inline]
```

Indicator if the maximum number of tests was required.

#### Return values

<i>true,if</i>	the maximum number of tests was required or if the counter was initialized to zero.
----------------	---

Definition at line 83 of file [poll\\_timeout\\_counter.h](#).

The documentation for this class was generated from the following file:

- [pkg/drivers-frst/include/poll\\_timeout\\_counter.h](#)

## 15.188 L4::Poll\_timeout\_kipclock Class Reference

A polling timeout based on the [L4Re](#) clock.

```
#include <poll_timeout_kipclock>
```

Collaboration diagram for L4::Poll\_timeout\_kipclock:

### Public Member Functions

- [Poll\\_timeout\\_kipclock](#) (unsigned poll\_time\_us)  
*Initialise relative timeout in microseconds.*
- void [set](#) (unsigned poll\_time\_us)  
*(Re-)Set relative timeout in microseconds*
- bool [test](#) (bool expression=true)  
*Test whether timeout has expired.*
- bool [timed\\_out](#) () const  
*Query whether timeout has expired.*

### 15.188.1 Detailed Description

A polling timeout based on the [L4Re](#) clock.

This class allows to conveniently add a timeout to a polling loop.

The original

```
while (device.read(State) & Busy)
;
```

is converted to

```
Poll_timeout_kipclock timeout(10000);
while (timeout.test(device.read(State) & Busy))
;
if (timeout.timed_out())
    printf("ERROR: Device does not respond.\n");
```

Definition at line 38 of file [poll\\_timeout\\_kipclock](#).

## 15.188.2 Constructor & Destructor Documentation

### 15.188.2.1 Poll\_timeout\_kipclock()

```
L4::Poll_timeout_kipclock::Poll_timeout_kipclock (
    unsigned poll_time_us ) [inline]
```

Initialise relative timeout in microseconds.

#### Parameters

<i>poll_time_us</i>	Polling timeout in microseconds.
---------------------	----------------------------------

Definition at line 45 of file [poll\\_timeout\\_kipclock](#).

References [set\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.188.3.2 test()

```
bool L4::Poll_timeout_kipclock::test (
    bool expression = true ) [inline]
```

Test whether timeout has expired.

#### Parameters

<i>expression</i>	Optional expression.
-------------------	----------------------

#### Return values

<i>false</i>	The timeout has expired or the given expression returned false.
<i>true</i>	The timeout has not expired and the optionally given expression returns true.

Definition at line 68 of file [poll\\_timeout\\_kipclock](#).

References [l4\\_kip\\_clock\(\)](#), and [l4re\\_kip\(\)](#).

Here is the call graph for this function:

### 15.188.3.3 timed\_out()

```
bool L4::Poll_timeout_kipclock::timed_out ( ) const [inline]
```

Query whether timeout has expired.

#### Returns

Expiry state of timeout

Definition at line 80 of file [poll\\_timeout\\_kipclock](#).

The documentation for this class was generated from the following file:

- `l4/re/util/poll_timeout_kipclock`

## 15.189 L4::Proto\_t< P > Struct Template Reference

Data type for defining protocol numbers.

```
#include <__typeinfo.h>
```

Collaboration diagram for `L4::Proto_t< P >`:

### 15.189.1 Detailed Description

```
template<long P = PROTO_EMPTY>
struct L4::Proto_t< P >
```

Data type for defining protocol numbers.

## Template Parameters

<i>P</i>	The protocol number itself
----------	----------------------------

This type must be used when specifying a protocol number with [Kobject\\_x](#).

Definition at line 1192 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

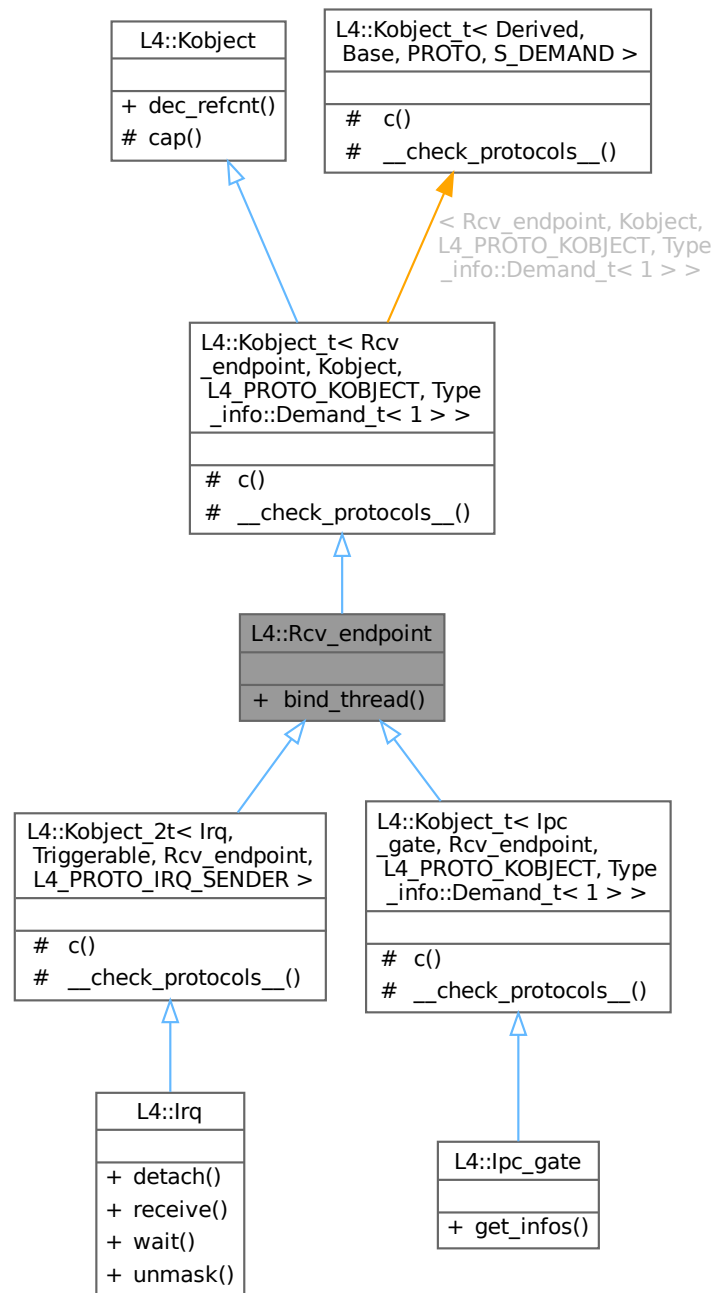

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.190 L4::Rcv\_endpoint Class Reference

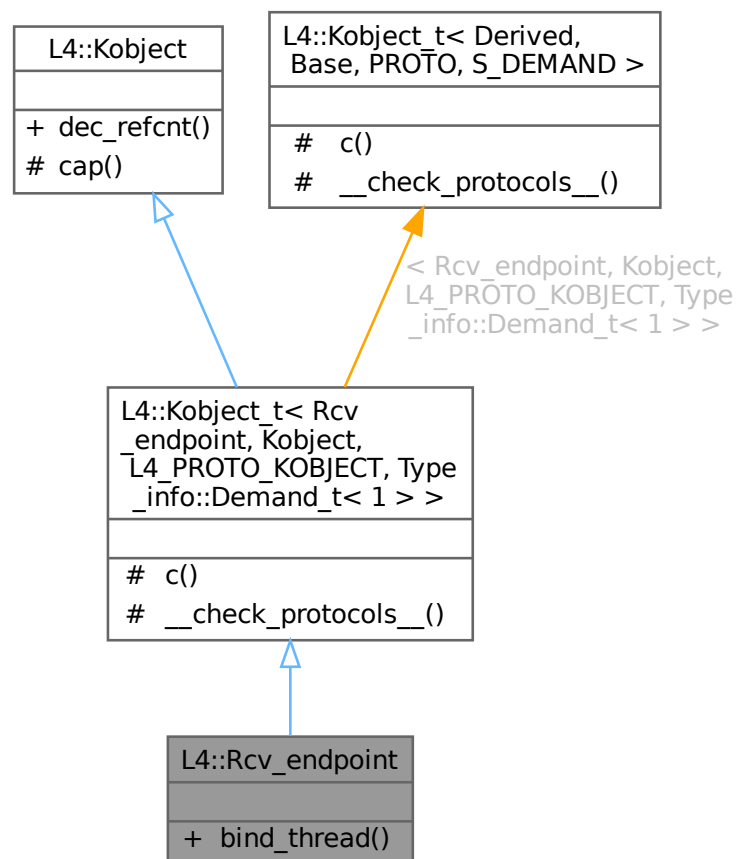

Interface for kernel objects that allow to receive IPC from them.

Helper to check for protocol conflicts.

## 15.190.1 Detailed Description

Interface for kernel objects that allow to receive IPC from them.

Such an object is for example an [lpc\\_gate](#) (with server rights) or an [lrq](#). Those objects allow to bind a thread that shall receive IPC from these object via [bind\\_thread\(\)](#).

Definition at line 40 of file [rcv\\_endpoint](#).

## 15.190.2 Member Function Documentation

### 15.190.2.1 [bind\\_thread\(\)](#)

```
l4_msgtag_t L4::Rcv_endpoint::bind_thread (
    Ipc::Cap< Thread > t,
    l4_umword_t label )
```

Bind a thread to an IPC receive endpoint.

#### Parameters

<i>t</i>	<a href="#">Thread</a> object that shall be bound to this receive endpoint.
<i>label</i>	Label to assign to <code>this</code> receive endpoint. The two least significant bits should usually be set to zero.

### Returns

Syscall return tag containing one of the following return codes.

### Return values

<code>L4_EOK</code>	Operation successful.
<code>-L4_EINVAL</code>	<code>t</code> is not a thread object or other arguments were malformed.
<code>-L4_EPERM</code>	No <a href="#">L4_CAP_FPAGE_S</a> right on <code>t</code> or the capability used to invoke this operation.

### Precondition

If this operation is invoked using an IPC gate capability without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread is bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless [L4::Thread::modify\\_senders\(\)](#) is used to change these labels.

The documentation for this class was generated from the following file:

### 15.191.1 Detailed Description

Abstract interface for object registries.

An object registry allows to register [L4::Epiface](#) objects at a server loop either for synchronous RPC messages or for asynchronous IRQ messages.

Definition at line 333 of file [ipc\\_epiface](#).

### 15.191.2 Member Function Documentation

#### 15.191.2.1 [register\\_irq\\_obj\(\)](#)

```
virtual L4::Cap< L4::Irq > L4::Registry\_iface::register\_irq\_obj (  
    L4::Epiface * o ) [pure virtual]
```

Register o as server-side object for asynchronous IRQs.

##### Parameters

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object for IRQs.
----------	---

##### Return values

<a href="#">L4::Cap</a> < <a href="#">L4::Irq</a> >	Capability to a new IRQ object on success.
<a href="#">L4::Cap</a> < <a href="#">L4::Irq</a> >:: <a href="#">Invalid</a>	The allocation of the IRQ has failed.

After successful registration `o->obj_cap()` will be the capability of the allocated IRQ object.

The function may allocate a capability slot for the object. In that case [unregister\\_obj\(\)](#) is responsible for freeing the slot as well.

Implemented in [L4Re::Util::Object\\_registry](#).

#### 15.191.2.2 [register\\_obj\(\)](#) [1/3]

```
virtual L4::Cap< void > L4::Registry\_iface::register\_obj (  
    L4::Epiface * o ) [pure virtual]
```

Register o as server-side object for synchronous RPC.

## Parameters

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object for RPC.
----------	--

## Return values

<i>L4::Cap&lt;void&gt;</i>	A valid capability to a new IPC gate.
<i>L4::Cap&lt;void&gt;::Invalid</i>	The allocation of the IPC gate has failed.

After successful registration `o->obj_cap()` will be the capability of the allocated IPC gate.

The function may allocate a capability slot for the object. In that case [unregister\\_obj\(\)](#) is responsible for freeing the slot as well.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.191.2.3 register\_obj()** [2/3]

```
virtual L4::Cap< void > L4::Registry_iface::register_obj (
    L4::Epiface * o,
    char const * service ) [pure virtual]
```

Register an [L4::Epiface](#) for an IPC gate available in the applications environment under the name `service`.

## Parameters

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered.
<i>service</i>	Name of the capability that shall be used to connect <code>o</code> to as a server-side object.

## Return values

<i>L4::Cap&lt;void&gt;</i>	The capability known as <code>service</code> on success.
<i>L4::Cap&lt;void&gt;::Invalid</i>	No capability with the given name found.

After a successful call to this function `o->obj_cap()` is equal to the capability in the environment with the name given by `service`.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.191.2.4 register\_obj()** [3/3]

```
virtual L4::Cap< L4::Rcv_endpoint > L4::Registry_iface::register_obj (
    L4::Epiface * o,
    L4::Cap< L4::Rcv_endpoint > ep ) [pure virtual]
```

Register `o` as server-side object for a pre-allocated capability.

## Parameters

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object.
<i>ep</i>	Capability to an already allocated capability where <i>o</i> shall be attached as server-side handler. The capability may point to an IPC gate or an IRQ.

## Return values

<i>L4::Cap&lt;L4::Rcv_endpoint&gt;</i>	Capability <i>ep</i> on success.
<i>L4::Cap&lt;L4::Rcv_endpoint&gt;::Invalid</i>	The IRQ attach operation has failed.

After successful registration *o*→*obj\_cap()* will be equal to *ep*.

Implemented in [L4Re::Util::Object\\_registry](#).

## 15.191.2.5 unregister\_obj()

```
virtual void L4::Registry_iface::unregister_obj (
    L4::Epiface * o,
    bool unmap = true ) [pure virtual]
```

Unregister the given object *o* from the server.

## Parameters

<i>o</i>	Pointer to the <a href="#">Epiface</a> object that shall be unregistered. The object must have been registered with any of the register methods if <a href="#">Registry_iface</a> .
<i>unmap</i>	If true the capability <i>o</i> → <i>obj_cap()</i> shall be unmapped from the local object space.

The function always unmaps and frees the capability if it was allocated by either [Registry\\_iface::register\\_irq\\_obj\(L4::Epiface \\*\)](#), or by [Registry\\_iface::register\\_obj\(L4::Epiface \\*\)](#).

Implemented in [L4Re::Util::Object\\_registry](#).

*Helper to check for protocol conflicts.***15.193.1 Detailed Description**

C++ interface of the [Scheduler](#) kernel object, see [Scheduler](#) for the C interface.

The [Scheduler](#) interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.

The scheduler offers IRQ number 0, which triggers when the number of online cores changes, e.g. due to hotplug events.

The [Scheduler](#) interface inherits from [L4::Icu](#) and [L4::Irq\\_eoi](#) for managing the scheduler virtual device IRQ which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

**Include File**

```
#include <l4/sys/scheduler>
```

Definition at line 57 of file [scheduler](#).

**15.193.2 Member Function Documentation****15.193.2.1 idle\_time()**

```
l4_msgtag_t L4::Scheduler::idle_time (
    l4_sched_cpu_set_t const & cpus,
    l4_kernel_clock_t * us )
```

Query the idle time (in µs) of a CPU.

## Parameters

	<i>cpus</i>	Set of CPUs to query. Only the idle time of the first selected CPU in <code>cpus.map</code> is queried.
out	<i>us</i>	Idle time of queried CPU in $\mu$ s.

## Return values

0	Success.
-L4_EINVAL	Invalid CPU requested in cpu set.

This function retrieves the idle time in  $\mu$ s of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate  $l$  one has to retrieve the idle time at the beginning ( $i1$ ) and the end ( $i2$ ) of a known time interval  $t$ . The load is then calculated as  $l = 1 - (i2 - i1)/t$ .

The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting -L4\_EINVAL or calculating an estimated (incorrect) load of 1.

## Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

## 15.193.2.2 info()

```
l4_msgtag_t L4::Scheduler::info (
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus,
    l4_umword_t * sched_classes = nullptr,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]
```

Get scheduler information.

## Parameters

out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be nullptr.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpus.granularity</i> (see <a href="#">l4_sched_cpu_set_t</a> ). <i>cpus.map</i> Bitmap of online CPUs. Pass nullptr to omit this information.
out	<i>sched_classes</i>	A bitmap of available scheduling classes (see <code>L4_scheduler_classes</code> ). Pass nullptr to omit this information.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 85 of file [scheduler](#).

References [l4\\_sched\\_cpu\\_set\\_t::gran\\_offset](#), and [l4\\_sched\\_cpu\\_set\\_t::map](#).

### 15.193.2.3 is\_online()

```
bool L4::Scheduler::is_online (
    l4_umword_t cpu,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]
```

Query if a CPU is online.

#### Parameters

<i>cpu</i>	CPU number whose online status should be queried.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<i>true</i>	The CPU is online.
<i>false</i>	The CPU is offline

Definition at line 165 of file [scheduler](#).

### 15.193.2.4 run\_thread()

```
l4_msgtag_t L4::Scheduler::run_thread (
    Ipc::Cap< Thread > thread,
    l4_sched_param_t const & sp )
```

Run a thread on a [Scheduler](#).

#### Parameters

<i>thread</i>	Capability of the thread to run.
<i>sp</i>	Scheduling parameters.

#### Return values

<i>0</i>	Success.
<i>-L4_EINVAL</i>	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

#### Note

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

The documentation for this class was generated from the following file:

## 15.194.1 Detailed Description

C++ Kernel-provided semaphore interface, see [Kernel-provided semaphore](#) for the C interface.

This is the interface for kernel-provided semaphore objects. The object provides the classical functions `up()` and `down()` for counting the semaphore and blocking. The semaphore is a [Triggerable](#) with respect to the `up()` function, this means that a semaphore can be bound to an interrupt line at an ICU ([L4::lcu](#)) and incoming interrupts increment the semaphore counter.

The `down()` method decrements the semaphore counter and blocks if the counter is already zero. Blocking on a semaphore may—as all blocking operations—either return successfully, or be aborted due to an expired timeout provided to the `down()` operation, or due to an [L4::Thread::ex\\_regs\(\)](#) operation with the [L4\\_THREAD\\_EX\\_REGS\\_CANCEL](#) flag set.

A semaphore object is initialized with counter value 0.

The main reason for using a semaphore instead of an [L4::Irq](#) is to ensure that incoming trigger signals do not interfere with any open-wait operations, as used for example in a server loop.

Definition at line 54 of file [semaphore](#).

## 15.194.2 Member Function Documentation

### 15.194.2.1 `down()`

```
l4_msgtag_t L4::Semaphore::down (
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

[Semaphore](#) down operation.

#### Parameters

<i>timeout</i>	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. Use [l4\\_error\(\)](#) to check for errors.

## Return values

<code>-L4_EPERM</code>	No <a href="#">L4_CAP_FPAGE_S</a> right on invoked semaphore capability.
------------------------	--

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an [up\(\)](#) operation.

Definition at line 90 of file [semaphore](#).

## 15.194.2.2 up()

```
l4_msgtag_t L4::Semaphore::up (
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

[Semaphore](#) up operation (wrapper for [trigger\(\)](#)).

## Parameters

<code>utcb</code>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------------	--

## Returns

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least  $2^{31}-1$ .

Definition at line 70 of file [semaphore](#).

References [L4::Triggerable::trigger\(\)](#).

Here is the call graph for this function:

### 15.195.1 Detailed Description

```
template<typename LOOP_HOOKS = lpc_svr::Default_loop_hooks>
class L4::Server< LOOP_HOOKS >
```

Basic server loop for handling client requests.

## Parameters

<code>LOOP_HOOKS</code>	the server inherits from <code>LOOP_HOOKS</code> and calls the hooks defined in <code>LOOP_HOOKS</code> in the server loop. See <a href="#">lpc_svr::Default_loop_hooks</a> , <a href="#">lpc_svr::Ignore_errors</a> , <a href="#">lpc_svr::Default_timeout</a> , <a href="#">lpc_svr::Compound_reply</a> , and <a href="#">lpc_svr::Br_manager_no_buffers</a> .
-------------------------	--

This is basically a simple server loop that uses a single message buffer for receiving requests and sending replies. The dispatcher determines how incoming messages are handled.

Definition at line 258 of file [ipc\\_server\\_loop](#).

## 15.195.2 Constructor & Destructor Documentation

### 15.195.2.1 Server()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
L4::Server< LOOP_HOOKS >::Server (
    l4_utcb_t * ) [inline], [explicit]
```

Initializes the server loop.

Note that this variant is deprecated. The UTCB can be specified with the server loop function ([l4\\_utcb\(\)](#) is the default). (2021-10)

Definition at line 270 of file [ipc\\_server\\_loop](#).

## 15.195.3 Member Function Documentation

### 15.195.3.1 internal\_loop()

```
template<typename L >
template<typename DISPATCH >
L4_NORETURN void L4::Server< L >::internal_loop (
    DISPATCH dispatch,
    l4_utcb_t * utcb ) [inline]
```

The server loop.

This function usually never returns, it waits for incoming messages calls the dispatcher, sends a reply and waits again.

Definition at line 343 of file [ipc\\_server\\_loop](#).

References [l4\\_msgtag\\_t::has\\_error\(\)](#), [L4\\_ENOREPLY](#), and [l4\\_msgtag\(\)](#).

Referenced by [L4::Server< LOOP\\_HOOKS >::loop\(\)](#), and [L4::Server< LOOP\\_HOOKS >::loop\\_noexc\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.195.3.2 loop()

```

template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
template<typename EXC , typename R >
L4_NORETURN void L4::Server< LOOP_HOOKS >::loop (
    R r,
    l4_utcb_t * u = l4_utcb() ) [inline]
  
```

[Server](#) loop with internal exception handling.

This server loop translates [L4::Runtime\\_error](#) exceptions into negative error return codes sent to the caller.

Definition at line 306 of file [ipc\\_server\\_loop](#).

References [L4::Server< LOOP\\_HOOKS >::internal\\_loop\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

*Type for server-side receive buffer demand.*

### 15.196.1 Detailed Description

Abstract server object to be used with [L4::Server](#) and [L4::Basic\\_registry](#).

#### Note

Usually [L4::Server\\_object\\_t](#) is used as a base class when writing server objects.

This server object provides an abstract interface that is used by the [L4::Registry\\_dispatcher](#) model. You can derive subclasses from this interface and implement application specific server objects.

Definition at line 49 of file [ipc\\_server](#).

### 15.196.2 Member Function Documentation

#### 15.196.2.1 dispatch() [1/2]

```
l4_msgtag_t L4::Server_object::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb ) [inline], [override], [virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt;0</code>	Error, reply with error code.
<code>&gt;=0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implements [L4::Epiface](#).

Definition at line 71 of file [ipc\\_server](#).

References [dispatch\(\)](#).

Here is the call graph for this function:

### 15.196.2.2 `dispatch()` [2/2]

```
virtual int L4::Server_object::dispatch (
    unsigned long rights,
    Ipc::Iostream & ios ) [pure virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>rights</i>	The rights bits in the invoked capability.
<i>ios</i>	The <a href="#">ipc::iostream</a> for reading the request and writing the reply.

#### Return values

<code>-L4_ENOREPLY</code>	Instructs the server loop to not send a reply.
<code>&lt; 0</code>	Error, reply with error code.
<code>&gt;= 0</code>	Success, reply with return value.

This function must be implemented by application specific server objects. The implementation must unmarshall data from the stream (`ios`) and create a reply by marshalling to the stream (`ios`). For details about the IPC stream see [IPC stream operators](#).

#### Note

You need to extract the complete message from the `ios` stream before inserting any reply data or before doing any function call that may use the UTCB. Otherwise, the incoming message may get lost.

Implemented in [L4::Server\\_object\\_x< Derived, IFACE, BASE >](#).

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Referenced by [dispatch\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

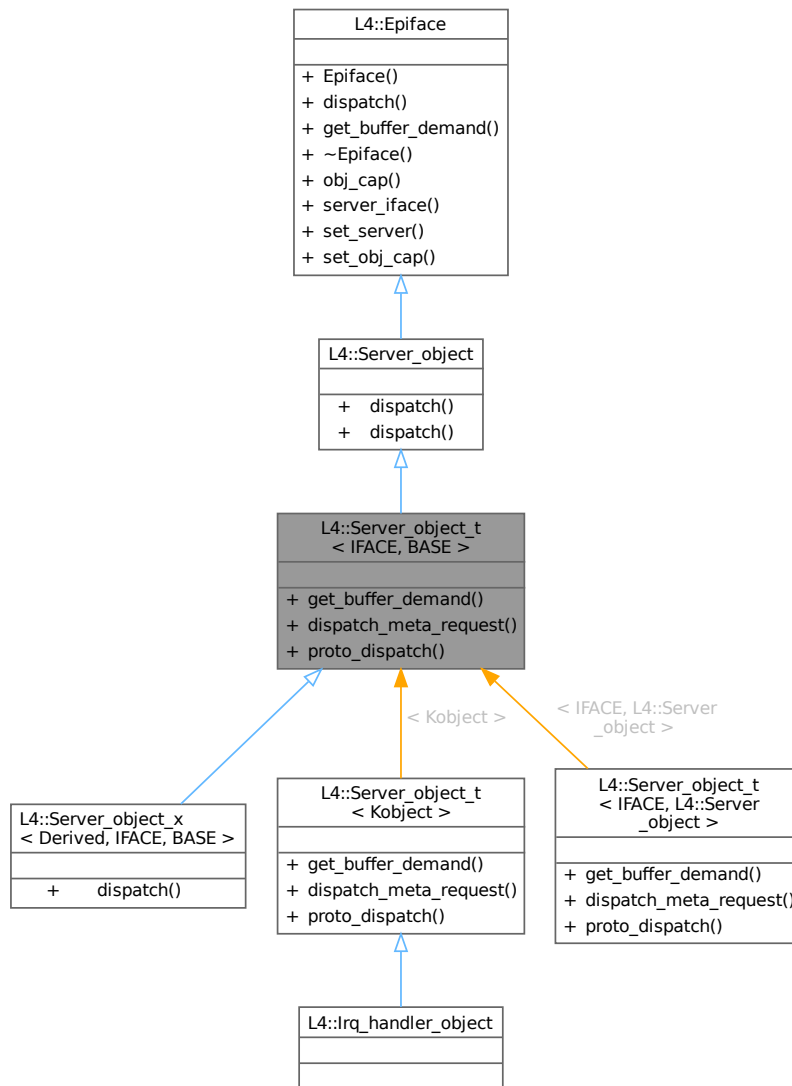

- [l4/cxx/ipc\\_server](#)

## 15.197 L4::Server\_object\_t< IFACE, BASE > Struct Template Reference

Base class (template) for server implementing server objects.

*Implementation of protocol-based dispatch for this server object.*

### 15.197.1 Detailed Description

```
template<typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_t< IFACE, BASE >
```

Base class (template) for server implementing server objects.

#### Template Parameters

<code>IFACE</code>	The IPC interface class that defines the interface that shall be implemented.
<code>BASE</code>	The server object base class (usually <code>L4::Server_object</code> ).

## Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Definition at line 91 of file [ipc\\_server](#).

## 15.197.2 Member Function Documentation

### 15.197.2.1 dispatch\_meta\_request()

```
template<typename IFACE , typename BASE = L4::Server_object>
int L4::Server_object_t< IFACE, BASE >::dispatch_meta_request (
    L4::Ipc::Iostream & ios ) [inline]
```

Implementation of the meta protocol based on *IFACE*.

## Parameters

<i>ios</i>	The IO stream used for receiving the message.
------------	---

This function can be used to handle incoming [L4\\_PROTO\\_META](#) protocol requests. The implementation uses the [L4::Type\\_info](#) of *IFACE* to handle the requests. Call this function in the implementation of [Server\\_object::dispatch\(\)](#) when the received message tag has protocol [L4\\_PROTO\\_META](#) ([L4::Meta::Protocol](#)).

Definition at line 110 of file [ipc\\_server](#).

### 15.197.2.2 get\_buffer\_demand()

```
template<typename IFACE , typename BASE = L4::Server_object>
BASE::Demand L4::Server_object_t< IFACE, BASE >::get_buffer_demand ( ) const [inline], [override],
[virtual]
```

## Returns

the server-side buffer demand based in *IFACE*.

Implements [L4::Epiface](#).

Definition at line 97 of file [ipc\\_server](#).

### 15.197.2.3 proto\_dispatch()

```
template<typename IFACE , typename BASE = L4::Server_object>
template<typename THIS >
static int L4::Server_object_t< IFACE, BASE >::proto_dispatch (
    THIS * self,
    l4_umword_t rights,
    L4::Ipc::Iostream & ios ) [inline], [static]
```

Implementation of protocol-based dispatch for this server object.

## Parameters

<i>self</i>	The this pointer for the object (inherits from <a href="#">Server_object_t</a> ).
<i>rights</i>	The rights from the received IPC (forwarded to <code>p_dispatch()</code> ).
<i>ios</i>	The message stream for the incoming and the reply message.

[Server](#) objects may call this function from their [dispatch\(\)](#) function. This function reads the protocol ID from the message tag and uses the `p_dispatch` code to dispatch to overloaded `p_dispatch` functions of self.

Definition at line 125 of file [ipc\\_server](#).

References [l4\\_msgtag\\_t::label\(\)](#), and [L4::Kobject\\_typeid< T >::proto\\_dispatch\(\)](#).

Referenced by [L4::Server\\_object\\_x< Derived, IFACE, BASE >::dispatch\(\)](#).

### 15.198.1 Detailed Description

```
template<typename Derived, typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_x< Derived, IFACE, BASE >
```

Helper class to implement p\_dispatch based server objects.

## Template Parameters

<i>Derived</i>	The data type of your server object class.
<i>IFACE</i>	The data type providing the interface definition for the object.
<i>BASE</i>	Optional data-type of the base server object (usually <a href="#">L4::Server_object</a> )

This class implements the standard [dispatch\(\)](#) function of [L4::Server\\_object](#) and forwards incoming messages to a set of overloaded `p_dispatch()` functions. There must be a `p_dispatch()` function in `Derived` for each interface provided by `IFACE` with the signature

```
int p_dispatch(Iface *, unsigned rights, L4::Ipc::Iostream &)
```

that is called for messages with `protocol == Iface::Protocol`.

Example signature for [L4Re::Dataspace](#) is:

```
int p_dispatch(L4Re::Dataspace *, unsigned, L4::Ipc::Iostream &)
```

Definition at line [154](#) of file [ipc\\_server](#).

The documentation for this struct was generated from the following file:

- [l4/cxx/ipc\\_server](#)

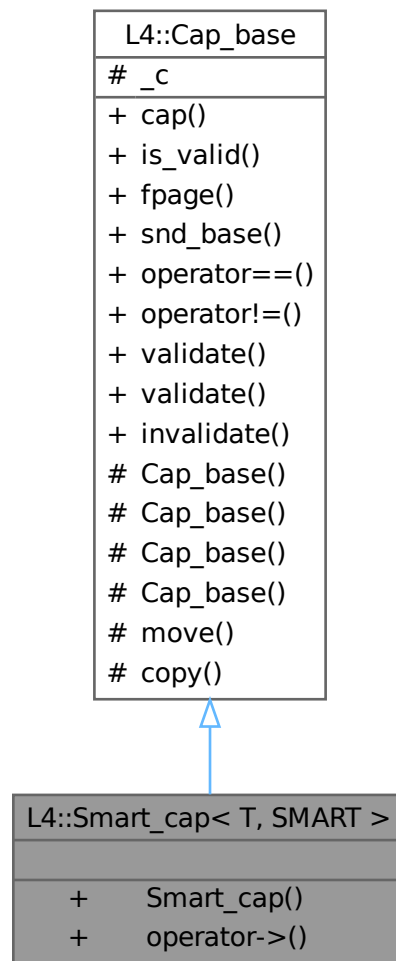

## 15.199 L4::Smart\_cap< T, SMART > Class Template Reference

Smart capability class.

*The C representation of a capability selector.*

### 15.199.1 Detailed Description

```
template<typename T, typename SMART>
class L4::Smart_cap< T, SMART >
```

Smart capability class.

Definition at line 36 of file [smart\\_capability](#).

### 15.199.2 Constructor & Destructor Documentation

#### 15.199.2.1 Smart\_cap()

```
template<typename T , typename SMART >
template<typename O >
L4::Smart_cap< T, SMART >::Smart_cap (
    Cap< O > const & p ) [inline], [noexcept]
```

Internal constructor, use to generate a capability from a `this` pointer.

#### Attention

This constructor is only useful to generate a capability from the `this` pointer of an objected that is an [L4::Kobject](#). Do `never` use this constructor for something else!

#### Parameters

<i>p</i>	The <code>this</code> pointer of the <a href="#">Kobject</a> or derived object
----------	--

Definition at line 73 of file [smart\\_capability](#).

The documentation for this class was generated from the following file:

## 15.201.1 Detailed Description

C++ interface of the [Task](#) kernel object, see [Task](#) for the C interface.

The [L4::Task](#) class represents a combination of the address spaces provided by the [L4Re](#) micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space associated with an [L4::Task](#).

[L4::Task](#) objects are created using the [L4::Factory](#) interface.

### Include File

```
#include <l4/sys/task>
```

Definition at line 44 of file [task](#).

## 15.201.2 Member Function Documentation

### 15.201.2.1 add\_ku\_mem()

```
l4_msgtag_t L4::Task::add_ku_mem (
    l4_fpage_t * fpage,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Add kernel-user memory.

#### Parameters

<i>in, out</i>	<i>fpage</i>	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Kernel-user memory (ku\_mem) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see [L4::Thread::Attr::bind\(\)](#)) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

#### Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page ([L4\\_PAGE\\_SIZE](#)). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on [L4::Task](#) objects. It might or might not work on [L4::Vm](#) objects or on [L4Re::Dma\\_space](#) objects but there is no practical use for adding kernel-user memory to [L4::Vm](#) objects or to [L4Re::Dma\\_space](#) objects.

Definition at line 255 of file [task](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.201.2.2 cap\_equal()

```

l4_msgtag_t L4::Task::cap_equal (
    Cap< void > const & cap_a,
    Cap< void > const & cap_b,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Test whether two capabilities point to the same object with the same rights.

#### Parameters

<i>cap<sub>a</sub></i>	First capability selector to compare.
<i>cap<sub>b</sub></i>	Second capability selector to compare.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<i>l4_msgtag_t::label()</i> = 1	<i>cap<sub>a</sub></i> and <i>cap<sub>b</sub></i> point to the same object.
<i>l4_msgtag_t::label()</i> = 0	The two caps do <b>not</b> point to the same object.

Definition at line 225 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.201.2.3 cap\_valid()

```

l4_msgtag_t L4::Task::cap_valid (
    Cap< void > const & cap,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Check whether a capability is present (refers to an object).

#### Parameters

<i>cap</i>	Valid capability to check for presence.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object).

A capability is considered present when it refers to an existing kernel object.

#### Precondition

`cap` must be a valid capability (i.e. `cap.is_valid() == true`). If you are unsure about the validity of your capability use [L4::Cap.validate\(\)](#) instead.

Definition at line 208 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

#### 15.201.2.4 delete\_obj()

```

l4_msgtag_t L4::Task::delete_obj (
    L4::Cap< void > obj,
    l4_utcb_t * utcb = l4_utcb() )  [inline], [noexcept]
  
```

Release capability and delete object.

##### Parameters

<i>obj</i>	Capability index of the object to delete.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.

If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)

This operation is equivalent to [unmap\(\)](#) with `L4_FP_DELETE_OBJ` flag.

Definition at line 168 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.201.2.5 map()

```

l4_msgtag_t L4::Task::map (
    Cap< Task > const & src_task,
    l4_fpage_t const & snd_fpage,
    l4_umword_t snd_base,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Map resources available in the source task to a destination task.

#### Parameters

<i>src_task</i>	Capability selector of the source task.
<i>snd_fpage</i>	Send flexpage that describes an area in the address space or object space of the source task.
<i>snd_base</i>	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see <a href="#">l4_fpage_cacheability_opt_t</a> for memory mappings, <a href="#">L4_obj_fpage_ctl</a> for object mappings, and <a href="#">L4_MAP_ITEM_GRANT</a> ; also see <a href="#">l4_map_control()</a> and <a href="#">l4_map_obj_control()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag. The function [l4\\_error\(\)](#) shall be used to test if the map operation was successful.

#### Return values

<a href="#">L4_EOK</a>	Operation successful (but see notes below).
<a href="#">-L4_EPERM</a>	No <a href="#">L4_CAP_FPAGE_W</a> right on capability used to invoke this operation.
<a href="#">-L4_EINVAL</a>	Invalid source task capability.
<a href="#">-L4_IPC_SEMAPFAILED</a>	The map operation failed due to limited quota.

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The destination task is the task referenced by the capability on which the map is invoked, and the receive window is the whole address space of that task. By specifying proper rights in the `snd_fpage` and `snd_base`, it is possible to remove rights during transfer.

**Note**

If the send flex page is of type [L4\\_FPAGE\\_OBJ](#), the [L4\\_CAP\\_FPAGE\\_S](#) right is removed from the transferred capability unless both the source and destination task capabilities possess the [L4\\_CAP\\_FPAGE\\_S](#) right themselves.

Even with [l4\\_error\(\)](#) returning [L4\\_EOK](#) there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

For more information on spaces and mappings, see [Spaces and Mappings](#). The flexpage API is described in more detail at [Flex pages](#).

**Note**

For peculiarities when using grant, see [L4\\_MAP\\_ITEM\\_GRANT](#).

Definition at line 95 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.201.2.6 release\_cap()**

```

l4_msgtag_t L4::Task::release_cap (
    L4::Cap< void > cap,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Release object capability.

**Parameters**

<i>cap</i>	Capability selector of the object to release.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

This operation unmaps the capability from `this` task.

**Note**

If the reference counter of the kernel object referenced by `cap` goes down to zero, the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 187 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.201.2.7 unmap()**

```

l4_msgtag_t L4::Task::unmap (
    l4_fpage_t const & fpage,
    l4_umword_t map_mask,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Revoke rights from the task.

**Parameters**

<i>fpage</i>	Flexpage that describes an area in one capability space of <code>this</code> task
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

This method allows to revoke rights from the destination task. For a flex page describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). If the set of rights is empty after the revocation, the capability is unmapped. It is guaranteed that the rights revocation is completed before this function returns.

**Note**

If the reference counter of a kernel object referenced in `fpage` goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 123 of file [task](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.201.2.8 unmap\_batch()

```

l4_msgtag_t L4::Task::unmap_batch (
    l4_fpage_t const * fpages,
    unsigned num_fpages,
    l4_umword_t map_mask,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Revoke rights from a task.

#### Parameters

<i>fpages</i>	An array of flexpages. Each item describes an area in one capability space of <code>this</code> task.
<i>num_fpages</i>	Number of fpages in the <i>fpages</i> array.
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

Revoke rights for an array of flexpages, see [unmap](#) for details.

#### Precondition

The caller needs to take care that `num_fpages` is not bigger than `L4_UTCB_GENERIC_DATA_SIZE - 2`.

Definition at line 142 of file [task](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.202.1 Detailed Description

C++ [L4](#) kernel thread interface, see [Thread](#) for the C interface.

The [Thread](#) class defines a thread of execution in the [L4](#) context. Usually user-level and kernel threads are mapped 1:1 to each other. [Thread](#) kernel objects are created using a factory, see the [L4::Factory](#) API ([L4::Factory::create\(\)](#)).

Amongst other things an [L4::Thread](#) encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the [L4::Scheduler](#) API
- Execution state
  - Blocked, Runnable, Running

[Thread](#) objects provide an API for

- [Thread](#) configuration and manipulation
- [Thread](#) switching.

#### Include File

```
#include <l4/sys/thread>
```

For the C interface see the [Thread](#) API. For more elaborated documentation on the vCPU feature see [vCPU API](#).

Definition at line 59 of file [thread](#).

### 15.202.2 Member Function Documentation

#### 15.202.2.1 [control\(\)](#)

```
l4\_msgtag\_t L4::Thread::control (  
    Attr const & attr ) [inline], [noexcept]
```

Commit the given thread-attributes object.

## Parameters

<i>attr</i>	the attribute object to commit to the thread.
-------------	---

## Returns

Syscall return tag containing one of the following return codes.

## Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> right on the capability used to invoke this operation or the task capability set in <a href="#">Attr::bind()</a> .
<i>-L4_EINVAL</i>	Malformed thread-attributes.

Definition at line 249 of file [thread](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

15.202.2.2 `ex_regs()` [1/2]

```

14_msgtag_t L4::Thread::ex_regs (
    14_addr_t * ip,
    14_addr_t * sp,
    14_umword_t * flags,
    14_utcb_t * utcb = 14_utcb() ) [inline], [noexcept]
  
```

Exchange basic thread registers and return previous values.

## Parameters

in, out	<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">14_utcb</a> .

## Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use [l4\\_error\(\)](#) to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see [flags](#)). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

The thread is started using [L4::Scheduler::run\\_thread\(\)](#). However, if at the time [L4::Scheduler::run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

Definition at line 123 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_ex\\_regs\\_ret\\_u\(\)](#).

Here is the call graph for this function:

### 15.202.2.3 ex\_regs() [2/2]

```

l4_msgtag_t L4::Thread::ex_regs (
    l4_addr_t ip,
    l4_addr_t sp,
    l4_umword_t flags,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Exchange basic thread registers.

## Parameters

<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged.
<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

System call return tag.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and

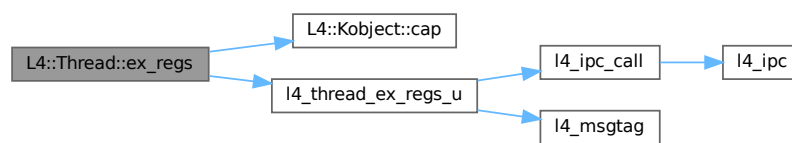

to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if `L4_THREAD_EX_REGS_TRIGGER_EXCEPTION` forces an IPC then changes in IP and SP take effect directly after returning from this IPC.

The thread is started using `L4::Scheduler::run_thread()`. However, if at the time `L4::Scheduler::run_thread()` is called, the instruction pointer of the thread is invalid, a later call to `ex_regs()` with a valid instruction pointer might start the thread.

Definition at line 90 of file `thread`.

References `L4::Kobject::cap()`, and `l4_thread_ex_regs_u()`.

Here is the call graph for this function:

#### 15.202.2.4 modify\_senders()

```
l4_msgtag_t L4::Thread::modify_senders (
    Modify_senders const & todo ) [inline], [noexcept]
```

Apply sender modification rules.

##### Parameters

<i>todo</i>	Prepared sender modification rules.
-------------	-------------------------------------

##### Returns

System call return tag.

The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.

See `Modify_senders` for a detailed description when applying sender modification rules is required.

##### Note

Modifying the senders of a thread running on a different CPU core is not supported.

See also

[l4\\_thread\\_modify\\_sender\\_commit\(\)](#)

Definition at line 501 of file [thread](#).

References [L4::Kobject::cap\(\)](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), and [L4\\_PROTO\\_THREAD](#).

Here is the call graph for this function:

### 15.202.2.5 register\_del\_irq()

```

l4_msgtag_t L4::Thread::register_del_irq (
    Cap< Irq > irq,
    l4_utcb_t * u = l4_utcb() ) [inline], [noexcept]
  
```

Register an IRQ that will trigger upon deletion events.

#### Parameters

<i>irq</i>	Capability selector for the IRQ object to be triggered.
<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

System call return tag containing the return code.

#### Return values

<code>-L4_BUSY</code>	A deletion IRQ is already bound to this thread.
<code>-L4_EPERM</code>	<a href="#">L4_CAP_FPAGE_W</a> missing on <code>irq</code>

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion `irq` can only be deregistered by deleting the `irq` or the thread.

List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.

Definition at line 414 of file [thread](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.202.2.6 stats\_time()

```
l4_msgtag_t L4::Thread::stats_time (
    l4_kernel_clock_t * us,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Get consumed time of thread in us.

Parameters

out	<i>us</i>	Consumed time in $\mu$ s.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

Returns

Syscall return tag.

Definition at line 270 of file [thread](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.202.2.7 switch\_to()

```

l4_msgtag_t L4::Thread::switch_to (
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Switch execution to this thread.

#### Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

#### Note

The current time slice is inherited to this thread.

Definition at line 259 of file [thread](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.202.2.8 vcpu\_control()

```

l4_msgtag_t L4::Thread::vcpu_control (
    l4_addr_t vcpu_state,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Enable the vCPU feature for the thread.

## Parameters

<i>vcpu_state</i>	A virtual address pointing to a <a href="#">l4_vcpu_state_t</a> . It must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

Syscall return tag.

This function enables the vCPU feature of `this` thread

The kernel-user memory starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of [l4\\_vcpu\\_state\\_t](#).

The asynchronous IPC handling is described at [vCPU API](#).

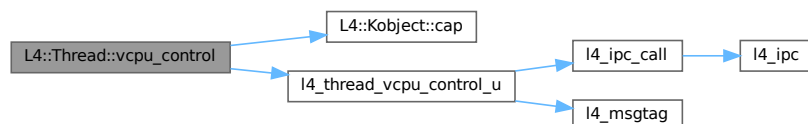

## Note

Disabling of the vCPU feature is optional and currently not supported.

Definition at line 354 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_vcpu\\_control\\_u\(\)](#).

Here is the call graph for this function:

## 15.202.2.9 vcpu\_control\_ext()

```

l4_msgtag_t L4::Thread::vcpu_control_ext (
    l4_addr_t ext_vcpu_state,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Enable the extended vCPU feature for the thread.

## Parameters

<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT or AMD's SVM.

This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of `l4_vcpu_state_t` at offset 0, the extended vCPU state at offset `L4_VCPU_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_EXT_INFOS`.

**Note**

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

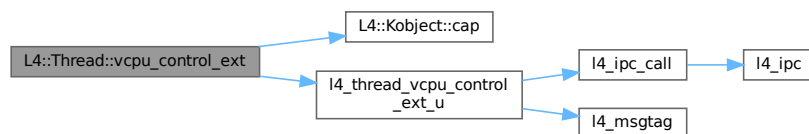

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 387 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_vcpu\\_control\\_ext\\_u\(\)](#).

Here is the call graph for this function:

**15.202.2.10 vcpu\_resume\_commit()**

```

l4_msgtag_t L4::Thread::vcpu_resume_commit (
    l4_msgtag_t tag,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Resume from vCPU asynchronous IPC handler, commit.

**Parameters**

<i>tag</i>	Tag to use, returned by <a href="#">l4_thread_vcpu_resume_start()</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag containing one of the following return codes.

## Return values

0	Indicates a VM exit, provided that <code>thread</code> is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the <code>thread</code> is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.
-L4_EINVAL	<code>thread</code> is not the current running thread, or does not have the vCPU feature enabled.
<0	A supplied mapping failed.

All flex pages in the UTCB (added with [l4\\_sndfpage\\_add\(\)](#) after [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#)) are unconditionally mapped into the user task configured in the vCPU state.

To resume into another address space, the capability to the target [Task](#) (or [L4::Vm](#)) must be set in [l4\\_vcpu\\_state\\_t::user\\_task](#) together with [L4\\_VCPU\\_F\\_USER\\_MODE](#). The capability selector must have all lower bits clear (see [L4\\_CAP\\_MASK](#)). The kernel adds the [L4\\_SYSF\\_SEND](#) flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the [L4\\_SYSF\\_REPLY](#) flag set.

The asynchronous IPC handling is described at [vCPU API](#).

## See also

## 15.202.2.11 vcpu\_resume\_start()

```

l4_msgtag_t L4::Thread::vcpu_resume_start (
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
  
```

Resume from vCPU asynchronous IPC handler, start.

## Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

## Returns

Message tag to be used for [l4\\_sndfpage\\_add\(\)](#) and [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#)

The vCPU resume functionality is split in multiple functions to allow the specification of additional send-flex-pages using [l4\\_sndfpage\\_add\(\)](#).

The asynchronous IPC handling is described at [vCPU API](#).

## Friends

- class [L4::Thread](#)

## 15.203.1 Detailed Description

[Thread](#) attributes used for [control\(\)](#).

This class is responsible for initializing various attributes of a thread in a UTCB for the [control\(\)](#) method.

### Note

Instantiation of this class starts the preparation of the UTCB. Do not invoke any non-Attr functions between the instantiation and the call to [L4::Thread::control\(\)](#).

### See also

[Thread control](#) for some more details.

Definition at line [141](#) of file [thread](#).

## 15.203.2 Constructor & Destructor Documentation

### 15.203.2.1 Attr()

```
L4::Thread::Attr::Attr (
    l4\_utcb\_t * utcb = l4\_utcb() ) [inline], [explicit], [noexcept]
```

Create a thread-attribute object with the given UTCB.

## Parameters

<i>utcb</i>	The UTCB to use for the later <a href="#">L4::Thread::control()</a> function. Usually this is the UTCB of the calling thread. See <a href="#">l4_utcb()</a> .
-------------	---

Definition at line [155](#) of file [thread](#).

### 15.203.3 Member Function Documentation

#### 15.203.3.1 [alien\(\)](#)

```
void L4::Thread::Attr::alien (
    int on ) [inline], [noexcept]
```

Enable alien mode.

## Parameters

<i>on</i>	Boolean value defining the state of the feature.
-----------	--

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the syscall arguments. If the exception handler replies with [L4\\_PROTO\\_ALLOW\\_SYSCALL](#) as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.

This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as [L4Re](#).

Definition at line [223](#) of file [thread](#).

#### 15.203.3.2 [bind\(\)](#)

```
void L4::Thread::Attr::bind (
    l4_utcb_t * thread_utcb,
    Cap< Task > const & task ) [inline], [noexcept]
```

Bind the thread to a task.

## Parameters

<i>thread_utcb</i>	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least <a href="#">L4_UTCB_OFFSET</a> bytes of kernel-user memory.
<i>task</i>	The task the thread shall be bound to.

**Precondition**

The thread must not be bound to a task yet.

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, `L4::Thread::ex_regs()` needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

**Note**

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

Definition at line 217 of file `thread`.

**15.203.3.3 `exc_handler()` [1/2]**

```
Cap< void > L4::Thread::Attr::exc_handler ( ) [inline], [noexcept]
```

Get the capability selector used for exception messages.

**Returns**

The capability selector used to send exception messages. The selector is valid in the task the thread is bound to.

Definition at line 193 of file `thread`.

Referenced by `exc_handler()`.

Here is the caller graph for this function:

**15.203.3.4 `exc_handler()` [2/2]**

```
void L4::Thread::Attr::exc_handler (
    Cap< void > const & exc_handler ) [inline], [noexcept]
```

Set the exception-handler capability selector.

## Parameters

<i>exc_handler</i>	The capability selector that shall be used for exception messages. This capability selector must be valid within the task the thread is bound to.
--------------------	---

Definition at line 184 of file [thread](#).

References [exc\\_handler\(\)](#).

Here is the call graph for this function:

### 15.203.3.5 pager() [1/2]

```
Cap< void > L4::Thread::Attr::pager ( ) [inline], [noexcept]
```

Get the capability selector used for page-fault messages.

## Returns

The capability selector used to send page-fault messages. The selector is valid in the task the thread is bound to.

Definition at line 174 of file [thread](#).

Referenced by [pager\(\)](#).

Here is the caller graph for this function:

### 15.203.3.6 pager() [2/2]

```
void L4::Thread::Attr::pager (
    Cap< void > const & pager ) [inline], [noexcept]
```

Set the pager capability selector.

## Parameters

<i>pager</i>	The capability selector that shall be used for page-fault messages. This capability selector must be valid within the task the thread is bound to.
--------------	--

Definition at line 165 of file [thread](#).

References [pager\(\)](#).

Here is the call graph for this function:

## 15.203.3.7 ux\_host\_syscall()

```
void L4::Thread::Attr::ux_host_syscall (
    int on ) [inline], [noexcept]
```

Allow host system calls on Fiasco-UX.

## Precondition

Running on Fiasco-UX.

Definition at line 231 of file [thread](#).

The documentation for this class was generated from the following file:

- [l4/sys/thread](#)

## 15.204 L4::Thread::Modify\_senders Class Reference

Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.

```
#include <thread>
```

Collaboration diagram for L4::Thread::Modify\_senders:

## Public Member Functions

- `int add (l4_umword_t match_mask, l4_umword_t match, l4_umword_t del_bits, l4_umword_t add_bits) noexcept`

*Add a rule.*

### 15.204.1 Detailed Description

Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.

Use the `add()` function to add modification rules, and use `modify_senders()` to commit. Do not use the UTCTB in between as it is used by `add()` and `modify_senders()`.

This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- a thread was unbound from an IPC gate / IRQ, or
- an IPC gate / IRQ was removed, or
- the label of an IPC gate / IRQ bound to a thread was changed.

It is not required to perform the `modify_sender` mechanism after an IPC gate or an IRQ was bound to a thread for the first time.

Definition at line 435 of file `thread`.

### 15.204.2 Member Function Documentation

#### 15.204.2.1 add()

```
int L4::Thread::Modify_senders::add (
    l4_umword_t match_mask,
    l4_umword_t match,
    l4_umword_t del_bits,
    l4_umword_t add_bits ) [inline], [noexcept]
```

Add a rule.

#### Parameters

<i>match_mask</i>	Bitmask of bits to match the label.
<i>match</i>	Bitmask that must be equal to the label after applying <i>match_mask</i> .
<i>del_bits</i>	Bits to be deleted from the label.
<i>add_bits</i>	Bits to be added to the label.

#### Returns

0 on success, <0 on error

In pseudo code: if `((sender_label & match_mask) == match) { sender_label = (sender_label & ~del_bits) | add_bits; }`

Only the first match is applied.

## 15.212 L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... > Struct Template Reference

Non-empty list of RPCs.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >:

## Data Structures

- struct [Rpc](#)

*Find the given RPC in the list.*

## Public Types

- enum  
*The opcode value to use for this RPC, may be bogus if the opcode\_type is void.*
- typedef [\\_Rpc](#) **type**  
*The list element itself.*
- typedef OPCODE **opcode\_type**  
*The data type for the opcode.*
- typedef R **rpc**  
*The RPC type L4::lpc::Msg::Rpc\_call or L4::lpc::Msg::Rpc\_inline\_call.*
- typedef [\\_Rpc](#)< OPCODE, \_Get\_opcode< R, O >::value+1, X... >::type **next**  
*The next RPC in the list or [Rpc\\_end](#) if this is the last.*

### 15.212.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename R, typename ... X>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, R, X... >
```

Non-empty list of RPCs.

Definition at line 380 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- l4/sys/[\\_\\_typeinfo.h](#)

## 15.213 L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >::Rpc< Y > Struct Template Reference

Find the given RPC in the list.

```
#include <__typeinfo.h>
```

Inherits L4::Typeid::Detail::\_Rpc< OP, RPCS >.

Collaboration diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >::Rpc< Y >:

### 15.213.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename R, typename ... X>
template<typename Y>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, R, X... >::Rpc< Y >
```

Find the given RPC in the list.

Definition at line 393 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.214 L4::Typeid::Detail::\_Rpc\_end Struct Reference

Internal end-of-list marker.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Detail::Rpc\_end:

Collaboration diagram for L4::Typeid::Detail::Rpc\_end:

### 15.214.1 Detailed Description

Internal end-of-list marker.

Definition at line 328 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.215 L4::Typeid::P\_dispatch< LIST > Struct Template Reference

Use for protocol based dispatch stage.

```
#include <__typeinfo.h>
```

Inherits L4::Typeid::P\_dispatch< LIST >.

Collaboration diagram for L4::Typeid::P\_dispatch< LIST >:

### 15.215.1 Detailed Description

```
template<typename LIST>
struct L4::Typeid::P_dispatch< LIST >
```

Use for protocol based dispatch stage.

Definition at line 319 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.216 L4::Typeid::Raw\_ipc< CLASS > Struct Template Reference

RPCs list for passing raw incoming IPC to the server object.

```
#include <l4/sys/capability>
```

Collaboration diagram for L4::Typeid::Raw\_ipc< CLASS >:

### 15.216.1 Detailed Description

```
template<typename CLASS>
struct L4::Typeid::Raw_ipc< CLASS >
```

RPCs list for passing raw incoming IPC to the server object.

## Template Parameters

<i>CLASS</i>	The type of the interface (e.g., <a href="#">L4::lcu</a> )
--------------	--

This template allows to have fully handcrafted IPC protocols.

Definition at line 423 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.217 L4::Typeid::Rpc\_nocode< OPERATION > Struct Template Reference

List of RPCs of an interface using a single operation without an opcode.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpc\_nocode< OPERATION >:

Collaboration diagram for L4::Typeid::Rpc\_nocode< OPERATION >:

### 15.217.1 Detailed Description

```
template<typename OPERATION>
struct L4::Typeid::Rpc_nocode< OPERATION >
```

List of RPCs of an interface using a single operation without an opcode.

Template Parameters

<i>OPERATION</i>	The RPC operation as defined by L4_RPC etc.
------------------	---

Definition at line 465 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.218 L4::Typeid::Rpc< RPCS > Struct Template Reference

Standard list of RPCs of an interface.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpc< RPCS >:

Collaboration diagram for L4::Typeid::Rpc< RPCS >:

### 15.218.1 Detailed Description

```
template<typename ... RPCS>
struct L4::Typeid::Rpc< RPCS >
```

Standard list of RPCs of an interface.

#### Template Parameters

<i>RPCS</i>	list of RPC types as defined by L4_RPC etc.
-------------	---

This is the default list for RPC functions of an interface, it uses [L4::Opcode](#) as opcode type and uses opcodes starting from 0.

Definition at line 439 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.219 L4::Typeid::Rpc\_code< OPCODE\_TYPE > Struct Template Reference

List of RPCs of an interface using a special opcode type.

```
#include <l4/sys/capability>
```

Collaboration diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >:

### Data Structures

- struct [F](#)

### 15.219.1 Detailed Description

```
template<typename OPCODE_TYPE>
struct L4::Typeid::Rpc_code< OPCODE_TYPE >
```

List of RPCs of an interface using a special opcode type.

#### Template Parameters

<i>OPCODE_TYPE</i>	The data type of the opcode.
--------------------	------------------------------

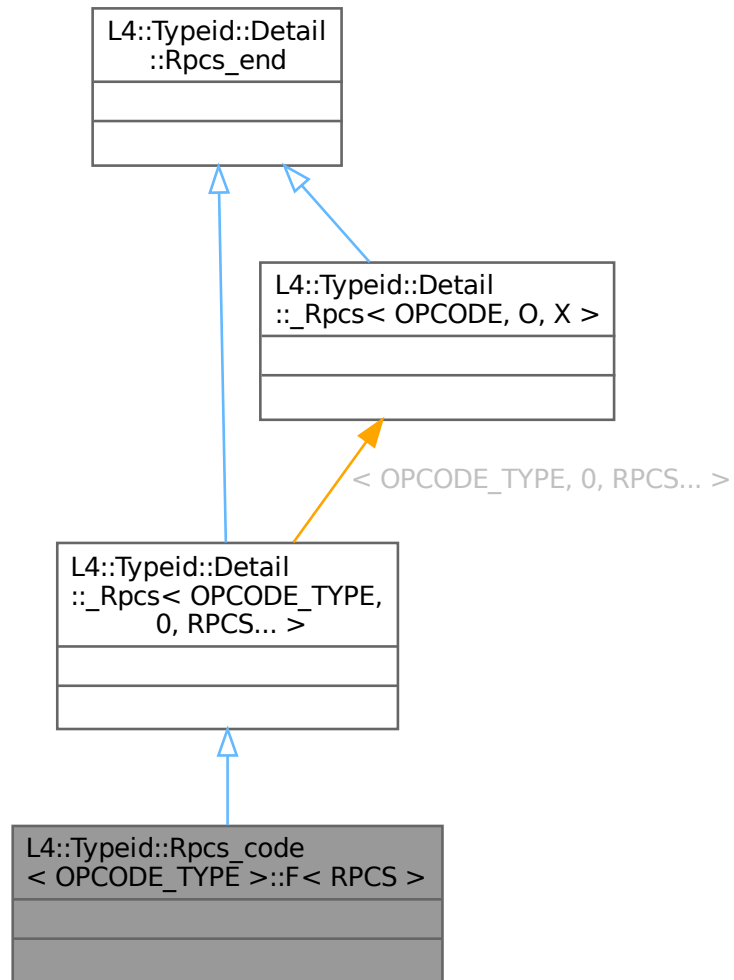

List for RPC functions of an interface, using OPCODE\_TYPE as data type for the opcode, opcodes starting from 0.

Definition at line 450 of file [\\_\\_typeinfo.h](#).

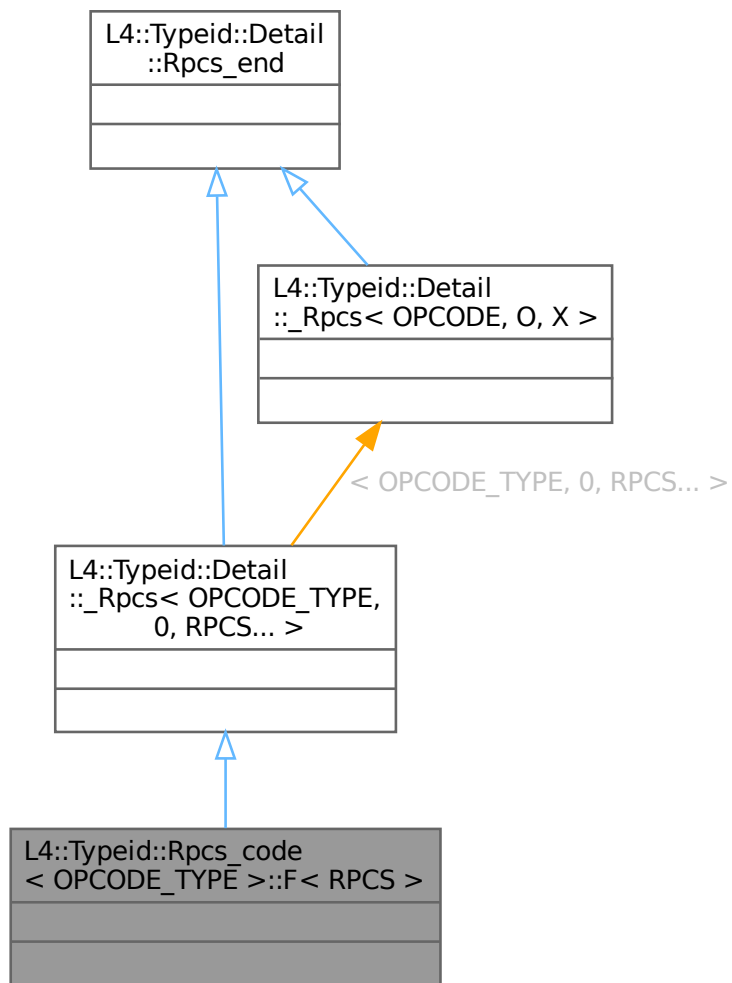

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.220 L4::Typeid::Rpc\_code< OPCODE\_TYPE >::F< RPCS > Struct Template Reference

Collaboration diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >::F< RPCS >:

### 15.220.1 Detailed Description

```

template<typename OPCODE_TYPE>
template<typename ... RPCS>
struct L4::Typeid::Rpc_code< OPCODE_TYPE >::F< RPCS >

```

#### Template Parameters

<i>RPCS</i>	list of RPC types as defined by L4_RPC etc.
-------------	---

Definition at line 456 of file `__typeinfo.h`.

The documentation for this struct was generated from the following file:

- `l4/sys/__typeinfo.h`

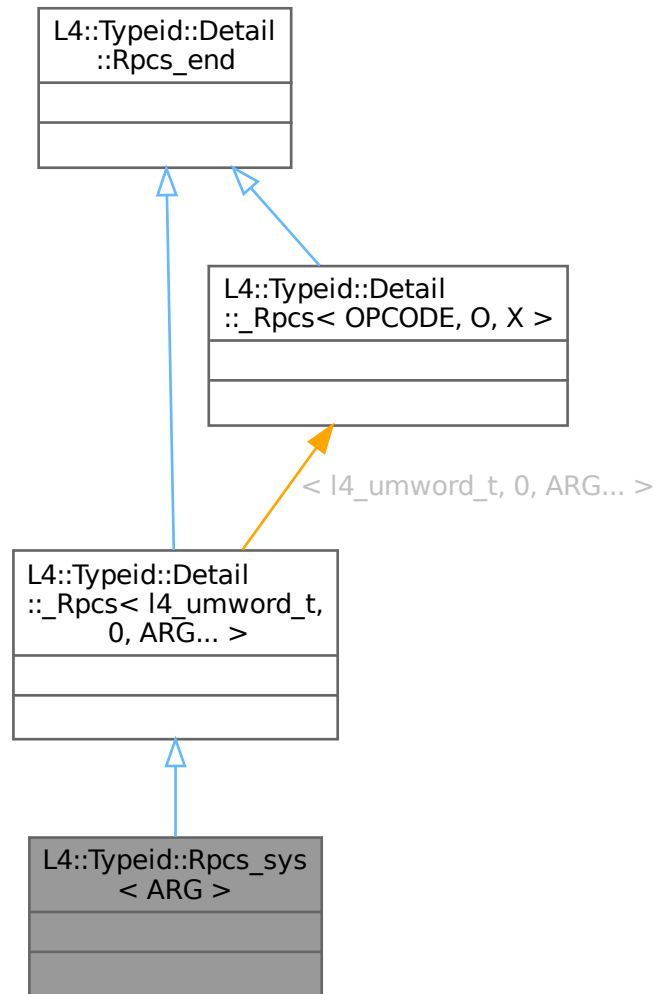

## 15.221 L4::Typeid::Rpcsys< ARG > Struct Template Reference

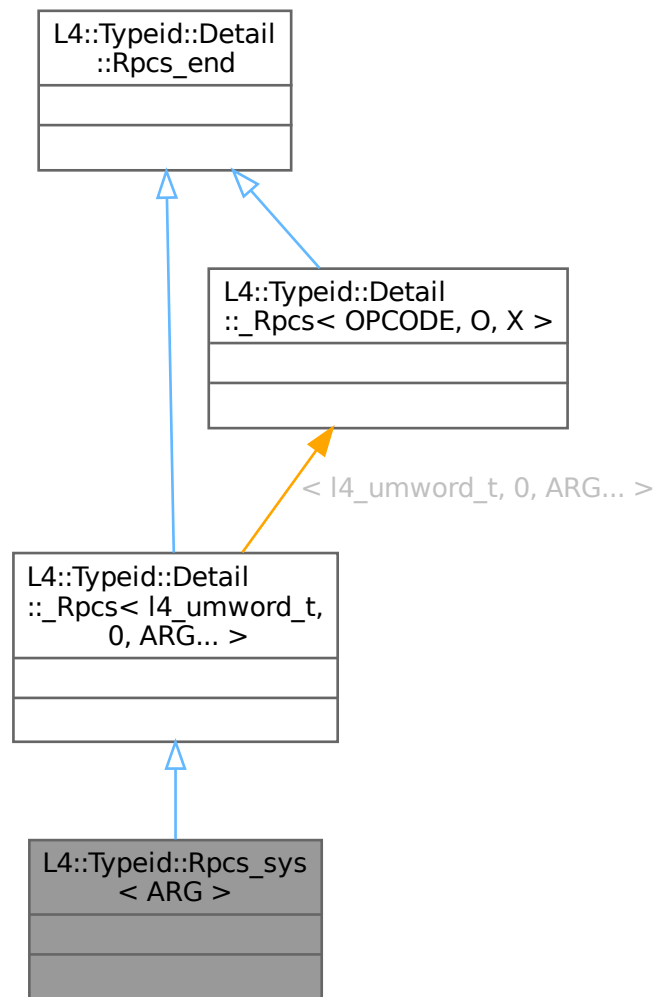

List of RPCs typically used for kernel interfaces.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpcsys< ARG >:

Collaboration diagram for L4::Typeid::Rpcsys< ARG >:

### 15.221.1 Detailed Description

```
template<typename ... ARG>
struct L4::Typeid::Rpcsys< ARG >
```

List of RPCs typically used for kernel interfaces.

Template Parameters

<i><b>RPCS</b></i>	list of RPC types as defined by L4_RPC etc.
--------------------	---

This list of RPC functions uses `I4_umword_t` as type for the opcode as most kernel protocol do.

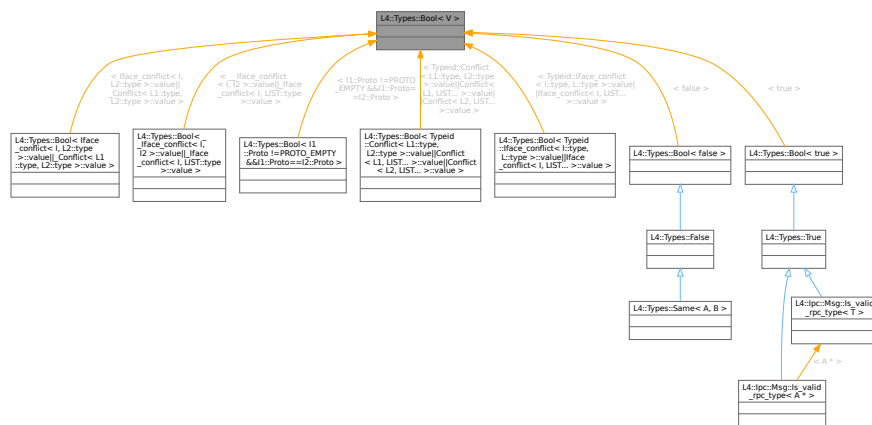

The documentation for this struct was generated from the following file:

- `l4/sys/__typeinfo.h`

Boolean meta type.

```
#include <types>
```

Inheritance diagram for L4::Types::Bool< V >:

Collaboration diagram for L4::Types::Bool< V >:

## Public Types

- `typedef Bool < V > type`  
*The meta type itself.*

### 15.222.1 Detailed Description

**template<bool V>**

```
struct L4::Types::Bool< V >
```

Boolean meta type.

## Template Parameters

V	The boolean value
---	-------------------

Definition at line 299 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.223 L4::Types::False Struct Reference

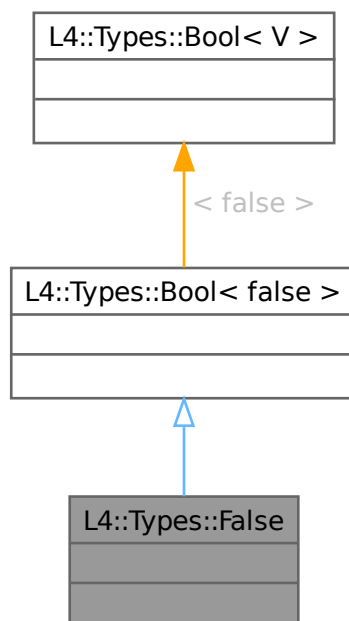

[False](#) meta value.

```
#include <types>
```

Inheritance diagram for L4::Types::False:

Collaboration diagram for L4::Types::False:

#### Additional Inherited Members

#### Public Types inherited from **L4::Types::Bool< false >**

- typedef **Bool< V >** **type**  
*The meta type itself.*

#### 15.223.1 Detailed Description

**False** meta value.

Definition at line 307 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.224 L4::Types::Flags< BITS\_ENUM, UNDERLYING > Class Template Reference

Template for defining typical [Flags](#) bitmaps.

```
#include <types>
```

Collaboration diagram for L4::Types::Flags< BITS\_ENUM, UNDERLYING >:

L4::Types::Flags< BITS\_ENUM, UNDERLYING >

```
+ Flags()
+ Flags()
+ Flags()
+ operator bool()
+ operator!()
+ operator|=()
+ operator|=()
+ operator&=()
+ operator&=()
+ operator~()
+ clear()
+ as_value()
+ from_raw()
```

### Public Types

- enum [None\\_type](#) { [None](#) }  
*The none type to get an empty bitmap.*
- typedef UNDERLYING **value\_type**  
*type of the underlying value*
- typedef BITS\_ENUM **bits\_enum\_type**  
*enum type defining a name for each bit*
- typedef [Flags](#)< BITS\_ENUM, UNDERLYING > **type**  
*the Flags<> type itself*

## Public Member Functions

- [Flags](#) ([None\\_type](#))  
*Make an empty bitmap.*
- **Flags** ()  
*Make default [Flags](#).*
- [Flags](#) ([BITS\\_ENUM](#) e)  
*Make flags from bit name.*
- **operator bool** () const  
*Support for `if (flags)` syntax (test for non-empty flags).*
- **bool operator!** () const  
*Support for `if (!flags)` syntax (test for empty flags).*
- [type](#) & **operator|=** ([type](#) rhs)  
*Support |= of two compatible [Flags](#) types.*
- [type](#) & **operator|=** ([bits\\_enum\\_type](#) rhs)  
*Support |= of [Flags](#) type and bit name.*
- [type](#) & **operator&=** ([type](#) rhs)  
*Support &= of two compatible [Flags](#) types.*
- [type](#) & **operator&=** ([bits\\_enum\\_type](#) rhs)  
*Support &= of [Flags](#) type and bit name.*
- [type](#) **operator~** () const  
*Support ~ for [Flags](#) types.*
- [type](#) & **clear** ([bits\\_enum\\_type](#) flag)  
*Clear the given flag.*
- [value\\_type](#) **as\_value** () const  
*Get the underlying value.*

## Static Public Member Functions

- static [type from\\_raw](#) ([value\\_type](#) v)  
*Make flags from a raw value of [value\\_type](#).*

## Friends

- [type operator|](#) ([type](#) lhs, [type](#) rhs)  
*Support | of two compatible [Flags](#) types.*
- [type operator|](#) ([type](#) lhs, [bits\\_enum\\_type](#) rhs)  
*Support | of [Flags](#) type and bit name.*
- [type operator&](#) ([type](#) lhs, [type](#) rhs)  
*Support & of two compatible [Flags](#) types.*
- [type operator&](#) ([type](#) lhs, [bits\\_enum\\_type](#) rhs)  
*Support & of [Flags](#) type and bit name.*

## 15.224.1 Detailed Description

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
class L4::Types::Flags< BITS_ENUM, UNDERLYING >
```

Template for defining typical [Flags](#) bitmaps.

## Template Parameters

<i>BITS_ENUM</i>	enum type that defines a name for each bit in the bitmap. The values of the enum members must be the number of the bit ( <i>not</i> a mask).
<i>UNDERLYING</i>	The underlying data type used to represent the bitmap.

The resulting data type provides a type-safe version that allows bitwise `and` and `or` operations with the `BITS_ENUM` members. As well as, test for 0 or !0.

## Example:

```
enum Test_flag
{
    Do_weak_tests,
    Do_strong_tests
};

typedef L4::Types::Flags<Test_flag> Test_flags;

Test_flags x = Do_weak_tests;

if (x & Do_strong_tests) { ... }
x |= Do_strong_tests;
if (x & Do_strong_tests) { ... }
```

Definition at line 63 of file [types](#).

## 15.224.2 Member Enumeration Documentation

### 15.224.2.1 None\_type

```
template<typename BITS_ENUM , typename UNDERLYING = unsigned long>
enum L4::Types::Flags::None_type
```

The none type to get an empty bitmap.

## Enumerator

None	Use this to get an empty bitmap.
------	----------------------------------

Definition at line 79 of file [types](#).

## 15.224.3 Constructor & Destructor Documentation

### 15.224.3.1 Flags() [1/2]

```
template<typename BITS_ENUM , typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
    None_type ) [inline]
```

Make an empty bitmap.

Usually used for implicit conversion from `Flags::None`.

```
Flags x = Flags::None;
```

Definition at line 89 of file [types](#).

### 15.224.3.2 Flags() [2/2]

```
template<typename BITS_ENUM , typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
    BITS_ENUM e ) [inline]
```

Make flags from bit name.

Usually used for implicit conversion for a bit name.

```
Test_flags f = Do_strong_tests;
```

Definition at line 102 of file [types](#).

## 15.224.4 Member Function Documentation

### 15.224.4.1 clear()

```
template<typename BITS_ENUM , typename UNDERLYING = unsigned long>
type & L4::Types::Flags< BITS_ENUM, UNDERLYING >::clear (
    bits_enum_type flag ) [inline]
```

Clear the given flag.

#### Parameters

<i>flag</i>	The flag that shall be cleared.
-------------	---------------------------------

`flags.clear(The_flag)` is a shortcut for `flags &= ~Flags(The_flag)`.

Definition at line 153 of file [types](#).

References [L4::Types::Flags< BITS\\_ENUM, UNDERLYING >::operator&=\(\)](#).

Here is the call graph for this function:

### 15.224.4.2 from\_raw()

```
template<typename BITS_ENUM , typename UNDERLYING = unsigned long>
static type L4::Types::Flags< BITS_ENUM, UNDERLYING >::from_raw (
    value_type v ) [inline], [static]
```

Make flags from a raw value of *value\_type*.

This function may be used for example in C wrapper code.

Definition at line 109 of file [types](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.225 L4::Types::Flags\_ops\_t< DT > Struct Template Reference

Mixin class to define a set of friend bitwise operators on DT.

```
#include <types>
```

Inheritance diagram for L4::Types::Flags\_ops\_t< DT >:

Collaboration diagram for L4::Types::Flags\_ops\_t< DT >:

L4::Types::Flags_ops_t< DT >
<ul style="list-style-type: none"> <li>+ operator =()</li> <li>+ operator&amp;=()</li> <li>+ operator bool()</li> <li>+ operator~()</li> </ul>

### Public Member Functions

- DT **operator|=** (DT r)  
*bitwise or assignment for DT*
- DT **operator&=** (DT r)  
*bitwise and assignment for DT*
- constexpr **operator bool** () const  
*explicit conversion to bool for tests*
- constexpr DT **operator~** () const  
*bitwise negation for DT*

### Friends

- constexpr DT **operator|** (DT l, DT r)  
*bitwise or for DT*
- constexpr DT **operator&** (DT l, DT r)  
*bitwise and for DT*
- constexpr bool **operator==** (DT l, DT r)  
*equality for DT*
- constexpr bool **operator!=** (DT l, DT r)  
*inequality for DT*

## 15.225.1 Detailed Description

```
template<typename DT>
struct L4::Types::Flags_ops_t< DT >
```

Mixin class to define a set of friend bitwise operators on DT.

## Template Parameters

<i>DT</i>	The type usually inheriting from <a href="#">Flags_ops_t</a> with a member <i>raw</i> of enum or integral type.
-----------	---

Definition at line 231 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.226 L4::Types::Flags\_t< DT, T > Struct Template Reference

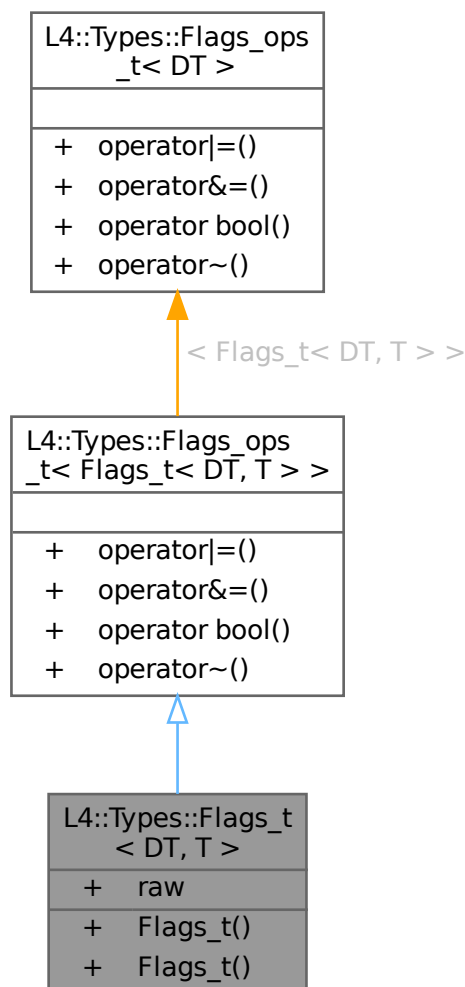

Template type to define a flags type with bitwise operations.

```
#include <types>
```

Inheritance diagram for L4::Types::Flags\_t< DT, T >:

Collaboration diagram for L4::Types::Flags\_t< DT, T >:

## Public Member Functions

- **Flags\_t**( )=default  
*Default (uninitializing) constructor.*
- constexpr **Flags\_t**( T f)  
*Explicit initialization from the underlying type.*

## Public Member Functions inherited from [L4::Types::Flags\\_ops\\_t< Flags\\_t< DT, T > >](#)

- [Flags\\_t](#)< DT, T > **operator|=**( [Flags\\_t](#)< DT, T > r)  
*bitwise or assignment for DT*
- [Flags\\_t](#)< DT, T > **operator&=**( [Flags\\_t](#)< DT, T > r)  
*bitwise and assignment for DT*

- constexpr **operator bool** () const  
*explicit conversion to bool for tests*
- constexpr **Flags\_t**< DT, T > **operator~** () const  
*bitwise negation for DT*

## Data Fields

- T raw  
*Raw integral value.*

### 15.226.1 Detailed Description

**template**<typename DT, typename T>  
**struct** L4::Types::Flags\_t< DT, T >

Template type to define a flags type with bitwise operations.

#### Template Parameters

<i>DT</i>	determinator type to make the resulting type unique (unused).
<i>T</i>	underlying type used to store the bits, usually an integral type.

Definition at line 283 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

### 15.227 L4::Types::Int\_for\_size< SIZE, bool > Struct Template Reference

Metafunction to get an unsigned integral type for the given size.

Collaboration diagram for L4::Types::Int\_for\_size< SIZE, bool >:

### 15.227.1 Detailed Description

```
template<unsigned SIZE, bool = true>
struct L4::Types::Int_for_size< SIZE, bool >
```

Metafunction to get an unsigned integral type for the given size.

Template Parameters

<i>SIZE</i>	The size of the integer in bytes.
-------------	-----------------------------------

Definition at line 164 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.228 L4::Types::Int\_for\_type< T > Struct Template Reference

Metafunction to get an integral type of the same size as T.

```
#include <types>
```

Collaboration diagram for L4::Types::Int\_for\_type< T >:

### Public Types

- typedef [Int\\_for\\_size](#)< sizeof(T)>::type **type**  
*The resulting unsigned integer type with the size like T.*

### 15.228.1 Detailed Description

```
template<typename T>
struct L4::Types::Int_for_type< T >
```

Metafunction to get an integral type of the same size as T.

## Template Parameters

<i>T</i>	The type for which an unsigned integral type with the same size is needed.
----------	--

Definition at line 191 of file [types](#).

The documentation for this struct was generated from the following file:

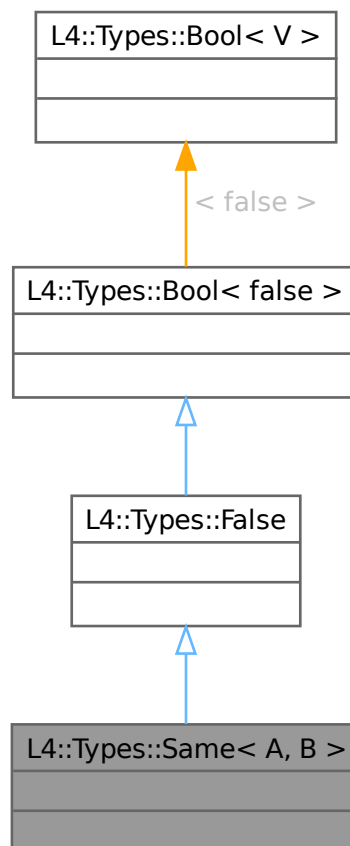

- [l4/sys/cxx/types](#)

## 15.229 L4::Types::Same< A, B > Struct Template Reference

Compare two data types for equality.

```
#include <types>
```

Inheritance diagram for L4::Types::Same< A, B >:

Collaboration diagram for L4::Types::Same< A, B >:

#### Additional Inherited Members

#### Public Types inherited from [L4::Types::Bool< false >](#)

- typedef [Bool< V >](#) **type**  
The meta type itself.

#### 15.229.1 Detailed Description

```
template<typename A, typename B>
struct L4::Types::Same< A, B >
```

Compare two data types for equality.

##### Template Parameters

<i>A</i>	The first data type
<i>B</i>	The second data type

The result is the boolean `True` if A and B are the same types.

Definition at line 323 of file `types`.

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/types`

## 15.230 L4::Types::True Struct Reference

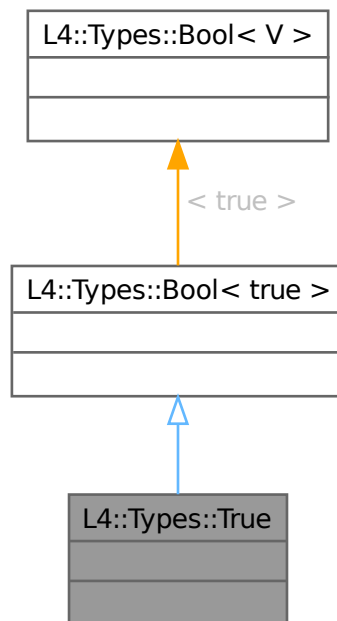

`True` meta value.

```
#include <types>
```

Inheritance diagram for `L4::Types::True`:

Collaboration diagram for L4::Types::True:

#### Additional Inherited Members

#### Public Types inherited from `L4::Types::Bool< true >`

- typedef `Bool< V >` **type**  
*The meta type itself.*

#### 15.230.1 Detailed Description

`True` meta value.

Definition at line 311 of file `types`.

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/types`

## 15.231 L4::Uart Class Reference

[Uart](#) driver abstraction.

```
#include <uart_base.h>
```

Inheritance diagram for L4::Uart:

Collaboration diagram for L4::Uart:

L4::Uart
<ul style="list-style-type: none"> <li>+ startup()</li> <li>+ shutdown()</li> <li>+ change_mode()</li> <li>+ get_char()</li> <li>+ char_avail()</li> <li>+ write()</li> <li>+ irq_ack()</li> <li>+ enable_rx_irq()</li> <li>+ mode()</li> <li>+ rate()</li> <li># generic_write()</li> </ul>

### Public Member Functions

- virtual bool [startup](#) (Io\_register\_block const \*regs)=0  
*Start the UART driver.*
- virtual void [shutdown](#) ()=0  
*Terminate the UART driver.*
- virtual bool [change\\_mode](#) (Transfer\_mode m, Baud\_rate r)=0  
*Set certain parameters of the UART.*
- virtual int [get\\_char](#) (bool blocking=true) const =0  
*Read a character from the UART.*
- virtual int [char\\_avail](#) () const =0  
*Check if there is at least one character available for reading from the UART.*
- virtual int [write](#) (char const \*s, unsigned long count, bool blocking=true) const =0  
*Transmit a number of characters.*
- virtual void [irq\\_ack](#) ()  
*Acknowledge a received interrupt.*
- virtual bool [enable\\_rx\\_irq](#) (bool=true)  
*Enable the receive IRQ.*
- Transfer\_mode [mode](#) () const  
*Return the transfer mode.*
- Baud\_rate [rate](#) () const  
*Return the baud rate.*

### Protected Member Functions

- template<typename Uart\_driver >  
int [generic\\_write](#) (char const \*s, unsigned long count, bool blocking=true) const  
*Internal function transmitting each character one-after-another and finally waiting that the transmission did actually finish.*

### 15.231.1 Detailed Description

[Uart](#) driver abstraction.

Definition at line 25 of file [uart\\_base.h](#).

### 15.231.2 Member Function Documentation

#### 15.231.2.1 `change_mode()`

```
virtual bool L4::Uart::change_mode (
    Transfer_mode m,
    Baud_rate r ) [pure virtual]
```

Set certain parameters of the UART.

##### Parameters

<i>m</i>	UART mode. Depends on the hardware.
<i>r</i>	Baud rate.

##### Return values

<i>true</i>	Mode setting succeeded (or was not performed at all).
<i>false</i>	Mode setting failed for some reason.

##### Note

Some drivers don't perform any mode setting at all and just return true.

Implemented in [L4::Uart\\_apb](#).

#### 15.231.2.2 `char_avail()`

```
virtual int L4::Uart::char_avail ( ) const [pure virtual]
```

Check if there is at least one character available for reading from the UART.

##### Returns

0 if there is no character available for reading, !=0 otherwise.

Implemented in [L4::Uart\\_apb](#).

#### 15.231.2.3 `enable_rx_irq()`

```
virtual bool L4::Uart::enable_rx_irq (
    bool = true ) [inline], [virtual]
```

Enable the receive IRQ.

## Return values

<i>true</i>	The RX IRQ was successfully enabled / disabled.
<i>false</i>	The RX IRQ couldn't be enabled / disabled. The driver does not support this operation.

Reimplemented in [L4::Uart\\_apb](#).

Definition at line 116 of file [uart\\_base.h](#).

#### 15.231.2.4 generic\_write()

```
template<typename Uart_driver >
int L4::Uart::generic_write (
    char const * s,
    unsigned long count,
    bool blocking = true ) const [inline], [protected]
```

Internal function transmitting each character one-after-another and finally waiting that the transmission did actually finish.

## Parameters

<i>s</i>	Buffer containing the characters.
<i>count</i>	The number of characters to transmit.
<i>blocking</i>	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

## Returns

The number of successful written characters.

Definition at line 145 of file [uart\\_base.h](#).

References [L4::Poll\\_timeout\\_counter::test\(\)](#).

Here is the call graph for this function:

#### 15.231.2.5 get\_char()

```
virtual int L4::Uart::get_char (
    bool blocking = true ) const [pure virtual]
```

Read a character from the UART.

**Parameters**

<i>blocking</i>	If true, wait until a character is available for reading. Otherwise do not wait and just return -1 if no character is available.
-----------------	--

**Returns**

The actual character read from the UART.

Implemented in [L4::Uart\\_apb](#).

**15.231.2.6 mode()**

```
Transfer_mode L4::Uart::mode ( ) const [inline]
```

Return the transfer mode.

**Returns**

The transfer mode.

Definition at line [123](#) of file [uart\\_base.h](#).

**15.231.2.7 rate()**

```
Baud_rate L4::Uart::rate ( ) const [inline]
```

Return the baud rate.

**Returns**

The baud rate.

Definition at line [130](#) of file [uart\\_base.h](#).

**15.231.2.8 shutdown()**

```
virtual void L4::Uart::shutdown ( ) [pure virtual]
```

Terminate the UART driver.

This includes disabling of interrupts.

Implemented in [L4::Uart\\_apb](#).

**15.231.2.9 startup()**

```
virtual bool L4::Uart::startup (
    Io_register_block const * regs ) [pure virtual]
```

Start the UART driver.

## Parameters

<i>regs</i>	IO register block of the UART.
-------------	--------------------------------

## Return values

<i>true</i>	Startup succeeded.
<i>false</i>	Startup failed.

Implemented in [L4::Uart\\_apb](#).

**15.231.2.10 write()**

```
virtual int L4::Uart::write (
    char const * s,
    unsigned long count,
    bool blocking = true ) const [pure virtual]
```

Transmit a number of characters.

## Parameters

<i>s</i>	Buffer containing the characters.
<i>count</i>	Number of characters to transmit.
<i>blocking</i>	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

## Returns

The number of successfully written characters.

Implemented in [L4::Uart\\_apb](#).

The documentation for this class was generated from the following file:

### 15.232.1 Detailed Description

Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (apb).

Definition at line 18 of file [uart\\_apb.h](#).

### 15.232.2 Member Function Documentation

#### 15.232.2.1 [change\\_mode\(\)](#)

```
bool L4::Uart_apb::change_mode (
    Transfer_mode m,
    Baud_rate r ) [override], [virtual]
```

Set certain parameters of the UART.

#### Parameters

<i>m</i>	UART mode. Depends on the hardware.
<i>r</i>	Baud rate.

## Return values

<i>true</i>	Mode setting succeeded (or was not performed at all).
<i>false</i>	Mode setting failed for some reason.

## Note

Some drivers don't perform any mode setting at all and just return true.

Implements [L4::Uart](#).

**15.232.2.2 char\_avail()**

```
int L4::Uart_apb::char_avail ( ) const [override], [virtual]
```

Check if there is at least one character available for reading from the UART.

## Returns

0 if there is no character available for reading, !=0 otherwise.

Implements [L4::Uart](#).

**15.232.2.3 enable\_rx\_irq()**

```
bool L4::Uart_apb::enable_rx_irq (
    bool ) [override], [virtual]
```

Enable the receive IRQ.

## Return values

<i>true</i>	The RX IRQ was successfully enabled / disabled.
<i>false</i>	The RX IRQ couldn't be enabled / disabled. The driver does not support this operation.

Reimplemented from [L4::Uart](#).

**15.232.2.4 get\_char()**

```
int L4::Uart_apb::get_char (
    bool blocking = true ) const [override], [virtual]
```

Read a character from the UART.

## Parameters

<i>blocking</i>	If true, wait until a character is available for reading. Otherwise do not wait and just return -1 if no character is available.
-----------------	--

**Returns**

The actual character read from the UART.

Implements [L4::Uart](#).

**15.232.2.5 shutdown()**

```
void L4::Uart_apb::shutdown ( ) [override], [virtual]
```

Terminate the UART driver.

This includes disabling of interrupts.

Implements [L4::Uart](#).

**15.232.2.6 startup()**

```
bool L4::Uart_apb::startup (
    Io_register_block const * regs ) [override], [virtual]
```

Start the UART driver.

**Parameters**

<i>regs</i>	IO register block of the UART.
-------------	--------------------------------

**Return values**

<i>true</i>	Startup succeeded.
<i>false</i>	Startup failed.

Implements [L4::Uart](#).

**15.232.2.7 write()**

```
int L4::Uart_apb::write (
    char const * s,
    unsigned long count,
    bool blocking = true ) const [override], [virtual]
```

Transmit a number of characters.

**Parameters**

<i>s</i>	Buffer containing the characters.
<i>count</i>	Number of characters to transmit.
<i>blocking</i>	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

**Returns**

The number of successfully written characters.

Implements [L4::Uart](#).

## 15.233.1 Detailed Description

[Exception](#) for an unknown condition.

This error is usually used when a server returns an unknown return state to the client, this may indicate incompatible messages used by the client and the server.

Definition at line 219 of file [exceptions](#).

The documentation for this class was generated from the following file:

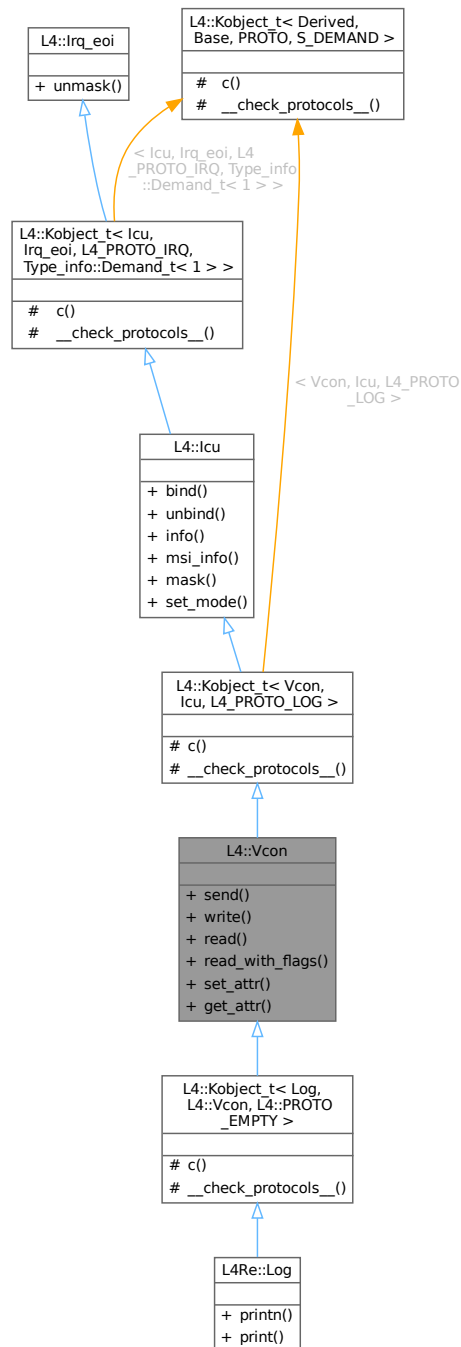

- [l4/cxx/exceptions](#)

## 15.234 L4::Vcon Class Reference

C++ [L4 Vcon](#) interface, see [Virtual Console](#) for the C interface.

```
#include <vcon>
```

Inheritance diagram for L4::Vcon:

Collaboration diagram for L4::Vcon:

## Public Member Functions

- `l4_msgtag_t send` (char const \*buf, unsigned size, `l4_utcb_t *utcb=l4_utcb()`) const noexcept  
Send data to *this* virtual console.
- `long write` (char const \*buf, unsigned size, `l4_utcb_t *utcb=l4_utcb()`) const noexcept  
Write data to *this* virtual console.
- `int read` (char \*buf, unsigned size, `l4_utcb_t *utcb=l4_utcb()`) const noexcept

Read data from *this* virtual console.

- `int read_with_flags (char *buf, unsigned size, l4\_utcb\_t *utcb=l4\_utcb\(\)) const noexcept`

Read data from *this* virtual console which also returns flags.

- `l4\_msgtag\_t set_attr (l4\_vcon\_attr\_t const *attr, l4\_utcb\_t *utcb=l4\_utcb\(\)) const noexcept`

Set the attributes of *this* virtual console.

- `l4\_msgtag\_t get_attr (l4\_vcon\_attr\_t *attr, l4\_utcb\_t *utcb=l4\_utcb\(\)) const noexcept`

Get attributes of *this* virtual console.

## Public Member Functions inherited from [L4::Icu](#)

- `l4\_msgtag\_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Bind an interrupt line of an interrupt controller to an interrupt object.

- `l4\_msgtag\_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Remove binding of an interrupt line from the interrupt controller object.

- `l4\_msgtag\_t info (l4\_icu\_info\_t *info, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Get information about the ICU features.

- `l4\_msgtag\_t msi_info (l4\_umword\_t irqnum, l4\_uint64\_t source, l4\_icu\_msi\_info\_t *msi_info)`

Get MSI info about IRQ.

- `l4\_msgtag\_t mask (unsigned irqnum, l4\_umword\_t *label=0, l4\_timeout\_t to=L4\_IPC\_NEVER, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Mask an IRQ line.

- `l4\_msgtag\_t set_mode (unsigned irqnum, l4\_umword\_t mode, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Set interrupt mode.

## Public Member Functions inherited from [L4::Irq\\_eoi](#)

- `l4\_msgtag\_t unmask (unsigned irqnum, l4\_umword\_t *label=0, l4\_timeout\_t to=L4\_IPC\_NEVER, l4\_utcb\_t *utcb=l4\_utcb\(\)) noexcept`

Unmask the given interrupt line.

## Additional Inherited Members

*Helper to check for protocol conflicts.*

## 15.234.1 Detailed Description

C++ [L4 Vcon](#) interface, see [Virtual Console](#) for the C interface.

[L4::Vcon](#) is a virtual console for simple character-based input and output. The interrupt for read events is provided by the virtual key interrupt.

The [Vcon](#) interface inherits from [L4::Icu](#) and [L4::Irq\\_eoi](#) for managing the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

#### Include File

```
#include <l4/sys/vcon>
```

See the [Virtual Console](#) for the C interface.

Definition at line 56 of file [vcon](#).

## 15.234.2 Member Function Documentation

### 15.234.2.1 [get\\_attr\(\)](#)

```
l4\_msgtag\_t L4::Vcon::get_attr (
    l4\_vcon\_attr\_t * attr,
    l4\_utcb\_t * utcb = l4\_utcb\(\) ) const [inline], [noexcept]
```

Get attributes of `this` virtual console.

## Parameters

out	attr	Attribute structure. Contains the attributes after a successful call of this function.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

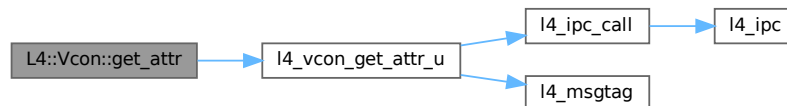

## Returns

Syscall return tag.

Definition at line 162 of file [vcon](#).

References [l4\\_vcon\\_get\\_attr\\_u\(\)](#).

Here is the call graph for this function:

## 15.234.2.2 read()

```

int L4::Vcon::read (
    char * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]

```

Read data from this virtual console.

## Parameters

out	buf	Pointer to data buffer.
	size	Size of the data buffer in bytes.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Return values

-L4_EPERM	The <a href="#">Vcon</a> instance requires the <a href="#">L4_CAP_FPAGE_W</a> right on the capability used to invoke this operation and this right is not present.
>size	More bytes to read, size bytes are in the buffer buf.
<=size	Number of bytes read.

## Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 109 of file [vcon](#).

References [l4\\_vcon\\_read\\_u\(\)](#).

Here is the call graph for this function:

### 15.234.2.3 read\_with\_flags()

```
int L4::Vcon::read_with_flags (
    char * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]
```

Read data from this virtual console which also returns flags.

#### Parameters

out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of the data buffer in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<code>-L4_EPERM</code>	The <a href="#">Vcon</a> instance requires the <a href="#">L4_CAP_FPAGE_W</a> right on the capability used to invoke this operation and this right is not present.
<code>&gt;size</code>	More bytes to read, <i>size</i> bytes are in the buffer <i>buf</i> .
<code>&lt;=size</code>	Number of bytes read.

If this function returns a positive value the caller can check the [L4\\_VCON\\_READ\\_STAT\\_BREAK](#) flag bit for a break condition. The bytes read can be obtained by masking the return value with [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.

#### Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 136 of file [vcon](#).

#### 15.234.2.4 send()

```
l4_msgtag_t L4::Vcon::send (
    char const * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]
```

Send data to this virtual console.

##### Parameters

<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

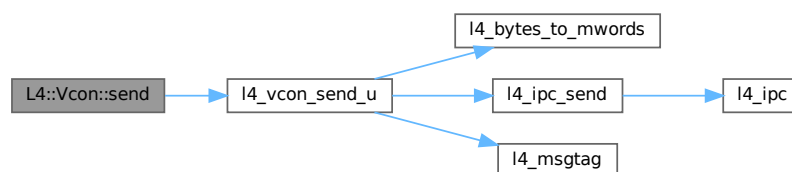

##### Note

Size must not exceed [L4\\_VCON\\_WRITE\\_SIZE](#), a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use [l4\\_ipc\\_error\(\)](#) to check for send errors, do not use [l4\\_error\(\)](#), as [l4\\_error\(\)](#) will always return an error.

Definition at line 76 of file [vcon](#).

References [l4\\_vcon\\_send\\_u\(\)](#).

Here is the call graph for this function:

#### 15.234.2.5 set\_attr()

```
l4_msgtag_t L4::Vcon::set_attr (
    l4_vcon_attr_t const * attr,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]
```

Set the attributes of this virtual console.

## Parameters

<i>attr</i>	Attribute structure with the attributes for the virtual console.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

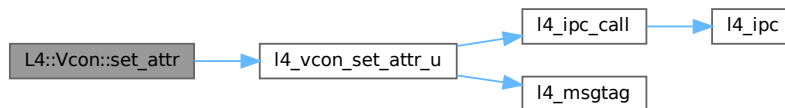

## Returns

Syscall return tag.

Definition at line 149 of file [vcon](#).

References [l4\\_vcon\\_set\\_attr\\_u\(\)](#).

Here is the call graph for this function:

## 15.234.2.6 write()

```

long L4::Vcon::write (
    char const * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb() ) const [inline], [noexcept]

```

Write data to this virtual console.

## Parameters

<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

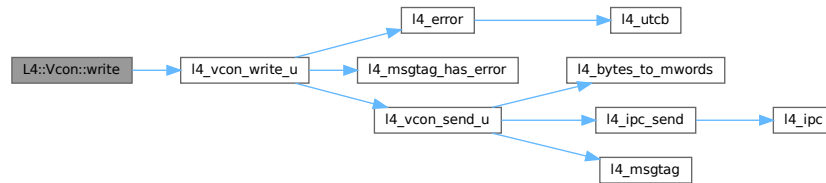

## Return values

<0	Error.
>=0	Number of bytes written to the virtual console.

Definition at line 90 of file [vcon](#).

References [l4\\_vcon\\_write\\_u\(\)](#).

Here is the call graph for this function:

## 15.235.1 Detailed Description

Virtual machine host address space.

[L4::Vm](#) is a specialisation of [L4::Task](#), used for virtual machines. The microkernel employs an appropriate page-table format for hosting VMs, such as ePT on VT-x. On Arm, it offers a call to make the virtual GICC area available to the VM.

Definition at line 28 of file [\\_\\_vm-arm.h](#).

## 15.235.2 Member Function Documentation

### 15.235.2.1 vgicc\_map()

```
l4_msgtag_t L4::Vm::vgicc_map (
    l4_fpage_t const vgicc_fpage,
    l4_utcb_t * utcb = l4_utcb() ) [inline], [noexcept]
```

Map the GIC virtual CPU interface page to the task in case Fiasco detected a GIC version 2.

## Parameters

<i>vgicc_fpage</i>	Flexpage that describes an area in the address space of the destination task to map the vGICC page to.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag.

Definition at line 41 of file [\\_\\_vm-arm.h](#).

## 15.238 l4\_ext\_vcpu\_state\_vmx\_t Struct Reference

VMX extended vCPU state.

```
#include <__vm-vmx.h>
```

Collaboration diagram for `l4_ext_vcpu_state_vmx_t`:

### 15.238.1 Detailed Description

VMX extended vCPU state.

For completeness, this is the overall memory layout of the vCPU:

0x000 - 0x1ff: Standard vCPU state [l4\\_vcpu\\_state\\_t](#) (with padding). 0x200 - 0x3ff: VMX capabilities (with padding). 0x400 - 0xffff: VMX extended vCPU state.

The memory layout of the VMX extended vCPU state is as follows:

0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries. 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different VMX extended vCPU state that has been loaded into the given state. 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS. 0x014 - 0x017: Reserved. 0x018 - 0x01f: Capability of the hardware VMCS object (with padding). 0x020 - 0x047: Software VMCS field offset table [l4\\_vmx\\_offset\\_table\\_t](#). 0x048 - 0x0bf: Reserved. 0x0c0 - 0xabf: Software VMCS fields (with padding). 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

Definition at line 231 of file [\\_\\_vm-vmx.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_vm-vmx.h](#)

## 15.239 l4\_fpage\_t Union Reference

[L4](#) flexpage type.

```
#include <__l4_fpage.h>
```

Collaboration diagram for [l4\\_fpage\\_t](#):

### Data Fields

unsigned **has\_error** () const [L4\\_NOTHROW](#)
- *Test if flags indicate an error.*

## Data Fields

- [l4\\_mword\\_t](#) **raw**  
*raw value*

## 15.245.1 Detailed Description

Message tag data structure.

### Include File

```
#include <l4/sys/types.h>
```

Describes the details of an IPC operation, in particular which parts of the UTCB have to be transmitted, and also flags to enable real-time and FPU extensions.

The message tag also contains a user-defined label that could be used to specify a protocol ID. Some negative values are reserved for kernel protocols such as page faults and exceptions.

The type must be treated completely opaque.

### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), [examples/libs/l4re/streammap/server.cc](#), [examples/sys/aliens/main.c](#), [examples/sys/ipc/ipc\\_example.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line [163](#) of file [types.h](#).

## 15.245.2 Member Function Documentation

### 15.245.2.1 flags()

```
unsigned l4_msgtag_t::flags ( ) const [inline]
```

Get the flags value.

The flags are a combination of the flags defined by [L4\\_msgtag\\_flags](#).

Definition at line [181](#) of file [types.h](#).

References [raw](#).

The documentation for this struct was generated from the following file:

- [l4/sys/types.h](#)

## 15.246 l4\_sched\_cpu\_set\_t Struct Reference

CPU sets.

```
#include <scheduler.h>
```

Collaboration diagram for l4\_sched\_cpu\_set\_t:

l4_sched_cpu_set_t
+ gran_offset
+ map
+ granularity()
+ offset()
+ set()

### Public Member Functions

*Combination of granularity and offset.*
- [l4\\_umword\\_t](#) [map](#)  
*Bitmap of CPUs.*

### 15.246.1 Detailed Description

CPU sets.

#### Examples

[examples/sys/migrate/thread\\_migrate.cc](#).

Definition at line 69 of file [scheduler.h](#).

## 15.246.2 Member Function Documentation

### 15.246.2.1 granularity()

```
unsigned char l4_sched_cpu_set_t::granularity ( ) const [inline]
```

#### Returns

Get granularity value

Definition at line 92 of file [scheduler.h](#).

References [gran\\_offset](#).

Referenced by [set\(\)](#).

Here is the caller graph for this function:

### 15.246.2.2 offset()

```
unsigned l4_sched_cpu_set_t::offset ( ) const [inline]
```

#### Returns

Get offset value

Definition at line 94 of file [scheduler.h](#).

References [gran\\_offset](#).

Referenced by [set\(\)](#).

Here is the caller graph for this function:

### 15.246.2.3 set()

```
void l4_sched_cpu_set_t::set (
    unsigned char granularity,
    unsigned offset ) [inline]
```

Set offset and granularity.

## Parameters

<i>granularity</i>	Granularity in log2 notation.
<i>offset</i>	Offset. Must be a multiple of $2^{\text{granularity}}$ .

Definition at line 101 of file [scheduler.h](#).

References [gran\\_offset](#), [granularity\(\)](#), and [offset\(\)](#).

Here is the call graph for this function:

### 15.246.3 Field Documentation

#### 15.246.3.1 gran\_offset

`l4_umword_t l4_sched_cpu_set_t::gran_offset`

Combination of granularity and offset.

The granularity defines how many CPUs each bit in map describes. And the offset is the number of the first CPU described by the first bit in the bitmap.

#### Precondition

offset must be a multiple of  $2^{\text{granularity}}$ .

MSB	LSB
8bit granularity	24bit offset ..

Definition at line 83 of file [scheduler.h](#).

Referenced by [granularity\(\)](#), [L4::Scheduler::info\(\)](#), [l4\\_sched\\_cpu\\_set\(\)](#), [offset\(\)](#), and [set\(\)](#).

The documentation for this struct was generated from the following file:

- [l4/sys/scheduler.h](#)

## 15.247 l4\_sched\_param\_t Struct Reference

Scheduler parameter set.

```
#include <scheduler.h>
```

Collaboration diagram for l4\_sched\_param\_t:

### Data Fields

- [l4\\_sched\\_cpu\\_set\\_t](#) **affinity**  
*CPU affinity.*
- [l4\\_umword\\_t](#) **prio**  
*Priority for scheduling.*
- [l4\\_umword\\_t](#) **quantum**  
*Timeslice in micro seconds.*

### 15.247.1 Detailed Description

Scheduler parameter set.

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/migrate/thread\\_migrate.cc](#), [examples/sys/singlestep/main.c](#),  
[examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line [184](#) of file [scheduler.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/scheduler.h](#)

## 15.248 l4\_snd\_fpage\_t Struct Reference

Send-flex-page types.

```
#include <__l4_fpage.h>
```

Collaboration diagram for l4\_snd\_fpage\_t:

### Data Fields

- `l4_umword_t snd_base`  
*Offset in receive window (send base)*
- `l4_fpage_t fpage`  
*Source flex-page descriptor.*

### 15.248.1 Detailed Description

Send-flex-page types.

Definition at line 108 of file `__l4_fpage.h`.

The documentation for this struct was generated from the following file:

- `l4/sys/__l4_fpage.h`

## 15.249 l4\_thread\_regs\_t Struct Reference

Encapsulation of the thread-control-register block of the UTCB.

```
#include <utcb.h>
```

Collaboration diagram for l4\_thread\_regs\_t:

### Data Fields

- [l4\\_umword\\_t](#) **error**  
*System call error codes.*
- [l4\\_umword\\_t](#) **free\_marker**  
*Kernel free marker.*
- [l4\\_umword\\_t](#) **user** [3]  
*User values (ignored and preserved by the kernel)*

### 15.249.1 Detailed Description

Encapsulation of the thread-control-register block of the UTCB.

Definition at line 110 of file [utcb.h](#).

The documentation for this struct was generated from the following file:

- l4/sys/[utcb.h](#)

## 15.250 l4\_timeout\_s Struct Reference

Basic timeout specification.

```
#include <__timeout.h>
```

Collaboration diagram for l4\_timeout\_s:

### Data Fields

- [l4\\_uint16\\_t](#) *t*  
*timeout value*

### 15.250.1 Detailed Description

Basic timeout specification.

Basically a floating point number with 10 bits mantissa and 5 bits exponent ( $t = m \cdot 2^e$ ).

If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.

Definition at line 48 of file [\\_\\_timeout.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_timeout.h](#)

## 15.251 l4\_timeout\_t Union Reference

Timeout pair.

```
#include <__timeout.h>
```

Collaboration diagram for l4\_timeout\_t:

### Data Fields

- `l4_uint32_t raw`  
*raw value*
- struct {  
    `l4_timeout_s rcv`  
        *receive timeout*  
    `l4_timeout_s snd`  
        *send timeout*  
} `p`  
  
*combined timeout*

### 15.251.1 Detailed Description

Timeout pair.

For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.

Definition at line 60 of file `__timeout.h`.

The documentation for this union was generated from the following file:

- `l4/sys/__timeout.h`

## 15.252 l4\_vcon\_attr\_t Struct Reference

Vcon attribute structure.

```
#include <vcon.h>
```

Collaboration diagram for l4\_vcon\_attr\_t:

l4_vcon_attr_t
+ i_flags
+ o_flags
+ l_flags
+ set_raw()

### Public Member Functions

- void [set\\_raw](#) ()  
*Set terminal attributes to disable all special processing.*

### Data Fields

The documentation for this struct was generated from the following file:

- `l4/sys/__vm-svm.h`

## 15.263 l4\_vm\_tz\_state Struct Reference

state structure for TrustZone VMs

```
#include <vm.h>
```

Collaboration diagram for l4\_vm\_tz\_state:

### 15.263.1 Detailed Description

state structure for TrustZone VMs

Definition at line 52 of file [vm.h](#).

The documentation for this struct was generated from the following file:

- [arm/l4/sys/vm.h](#)

## 15.264 l4\_vmx\_offset\_table\_t Struct Reference

Software VMCS field offset table.

```
#include <__vm-vmx.h>
```

Collaboration diagram for l4\_vmx\_offset\_table\_t:

### 15.264.1 Detailed Description

Software VMCS field offset table.

The memory layout is as follows:

0x00 - 0x02: 3 offsets for 16-bit fields. 0x03: Reserved. 0x04 - 0x06: 3 offsets for 64-bit fields. 0x07: Reserved. 0x08 - 0x0a: 3 offsets for 32-bit fields. 0x0b: Reserved. 0x0c - 0x0e: 3 offsets for natural-width fields. 0x0f: Reserved. 0x10 - 0x12: 3 limits for 16-bit fields. 0x13: Reserved. 0x14 - 0x16: 3 limits for 64-bit fields. 0x17: Reserved. 0x18 - 0x1a: 3 limits for 32-bit fields. 0x1b: Reserved. 0x1c - 0x1e: 3 limits for natural-width fields. 0x1f: Reserved. 0x20 - 0x23: 4 index shifts. 0x24: Offset of the first software VMCS field. 0x25: Size of the software VMCS fields. 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.

The offsets (after being multiplied by 64) are indexes in the values array in [l4\\_ext\\_vcpu\\_state\\_vmx\\_t](#) and bit indexes in the dirty\_bitmap array in [l4\\_ext\\_vcpu\\_state\\_vmx\\_t](#).

The limits (after being multiplied by 64) represent the range of the available indexes.

Definition at line 186 of file [\\_\\_vm-vmx.h](#).

The documentation for this struct was generated from the following file:

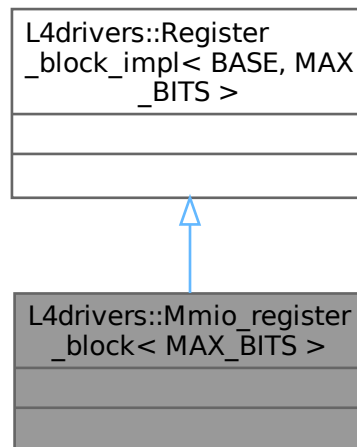

- l4/sys/\_\_vm-vmx.h

## 15.265 L4drivers::Mmio\_register\_block< MAX\_BITS > Struct Template Reference

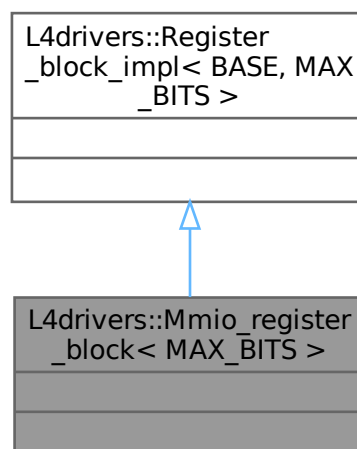

An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order.

```
#include <hw_mmio_register_block>
```

Inheritance diagram for L4drivers::Mmio\_register\_block< MAX\_BITS >:

Collaboration diagram for L4drivers::Mmio\_register\_block< MAX\_BITS >:

### 15.265.1 Detailed Description

```
template<unsigned MAX_BITS = 32>
struct L4drivers::Mmio_register_block< MAX_BITS >
```

An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order.

Definition at line 42 of file [hw\\_mmio\\_register\\_block](#).

The documentation for this struct was generated from the following file:

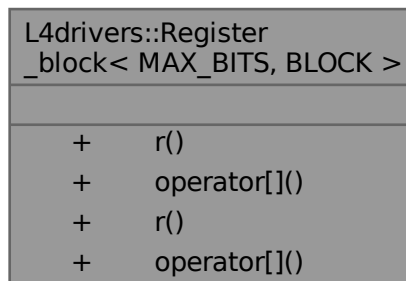

- pkg/drivers-frst/include/hw\_mmio\_register\_block

## 15.266 L4drivers::Register\_block< MAX\_BITS, BLOCK > Class Template Reference

Handles a reference to a register block of the given maximum access width.

```
#include <hw_register_block>
```

Collaboration diagram for L4drivers::Register\_block< MAX\_BITS, BLOCK >:

### Public Member Functions

- template<unsigned BITS>  
[Ro\\_register\\_tmpl](#)< BITS, Block > [r](#) (unsigned offset) const  
*Read only access to register at offset offset.*
- Ro\_register [operator\[\]](#) (unsigned offset) const  
*Read only access to register at offset offset.*
- template<unsigned BITS>  
[Register\\_tmpl](#)< BITS, Block > [r](#) (unsigned offset)  
*Read/write access to register at offset offset.*
- Register [operator\[\]](#) (unsigned offset)  
*Read/write access to register at offset offset.*

### 15.266.1 Detailed Description

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↵
BITS> >>
class L4drivers::Register_block< MAX_BITS, BLOCK >
```

Handles a reference to a register block of the given maximum access width.

#### Template Parameters

<i>MAX_BITS</i>	Maximum access width for the registers in this block.
<i>BLOCK</i>	Type implementing the register accesses (read<>(), write<>(), modify<>(), set<>(), and clear<>()).

Provides access to registers in this block via [r<WIDTH>\(\)](#) and [operator\[\]\(\)](#).

#### Example usage:

```
void test()
{
    // create a register block reference for max. 16bit accesses, using a
    // MMIO register block implementation (at address 0x1000).
    Hw::Register_block<16> regs = new Hw::Mmio_register_block<16>(0x1000);

    // Alternatively it is allowed to use an implementation that allows
    // wider access than actually needed.
    Hw::Register_block<16> regs = new Hw::Mmio_register_block<32>(0x1000);

    // read a 16bit register at offset 8byte
    unsigned short x = regs.r<16>(8);
    unsigned short x1 = regs[8];          // alternative

    // read an 8bit register at offset 0byte
    unsigned v = regs.r<8>(0);

    // do a 16bit write to register at offset 2byte (four variants)
    regs[2] = 22;
    regs.r<16>(2) = 22;
    regs[2].write(22);
    regs.r<16>().write(22);

    // do an 8bit write (two variants)
    regs.r<8>(0) = 9;
    regs.r<8>(0).write(9);

    // do 16bit read-modify-write (two variants)
    regs[4].modify(0xf, 3); // clear 4 lowest bits and set them to 3
    regs.r<16>(4).modify(0xf, 3);

    // do 8bit read-modify-write
    regs.r<8>(0).modify(0xf, 3);

    // fails to compile, because of too wide access
    // (32 bit access but regs is Hw::Register_block<16>)
    unsigned long v = regs.r<32>(4)
}
```

Definition at line 329 of file [hw\\_register\\_block](#).

### 15.266.2 Member Function Documentation

#### 15.266.2.1 operator[]() [1/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↵
BITS> >>
Register L4drivers::Register_block< MAX_BITS, BLOCK >::operator[] (
    unsigned offset ) [inline]
```

Read/write access to register at offset *offset*.

## Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

## Returns

register object allowing read and write access with width *MAX\_BITS*.

Definition at line 384 of file [hw\\_register\\_block](#).

**15.266.2.2 operator[]()** [2/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
Ro_register L4drivers::Register_block< MAX_BITS, BLOCK >::operator[] (
    unsigned offset ) const [inline]
```

Read only access to register at offset *offset*.

## Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

## Returns

register object allowing read only access with width *MAX\_BITS*.

Definition at line 364 of file [hw\\_register\\_block](#).

**15.266.2.3 r()** [1/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
template<unsigned BITS>
Register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
    unsigned offset ) [inline]
```

Read/write access to register at offset *offset*.

## Template Parameters

<i>BITS</i>	the access width in bits for the register.
-------------	--

## Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

**Returns**

register object allowing read and write access with width *BITS*.

Definition at line 375 of file [hw\\_register\\_block](#).

**15.266.2.4 r() [2/2]**

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
    unsigned offset ) const [inline]
```

Read only access to register at offset *offset*.

**Template Parameters**

<i>BITS</i>	the access width in bits for the register.
-------------	--

**Parameters**

<i>offset</i>	The offset of the register within the register file.
---------------	--

**Returns**

register object allowing read only access with width *BITS*.

Definition at line 356 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

- pkg/drivers-frst/include/hw\_register\_block

## 15.267 L4drivers::Register\_block\_base< MAX\_BITS > Struct Template Reference

Abstract register block interface.

Inheritance diagram for L4drivers::Register\_block\_base< MAX\_BITS >:

Collaboration diagram for L4drivers::Register\_block\_base< MAX\_BITS >:

### 15.267.1 Detailed Description

```
template<unsigned MAX_BITS = 32>
struct L4drivers::Register_block_base< MAX_BITS >
```

Abstract register block interface.

#### Template Parameters

<i>MAX_BITS</i>	The maximum access width for the registers.
-----------------	---

This interfaces is based on virtual `do_read_<xx>` and `do_write_<xx>` methods that have to be implemented up to the maximum access width.

Definition at line 71 of file [hw\\_register\\_block](#).

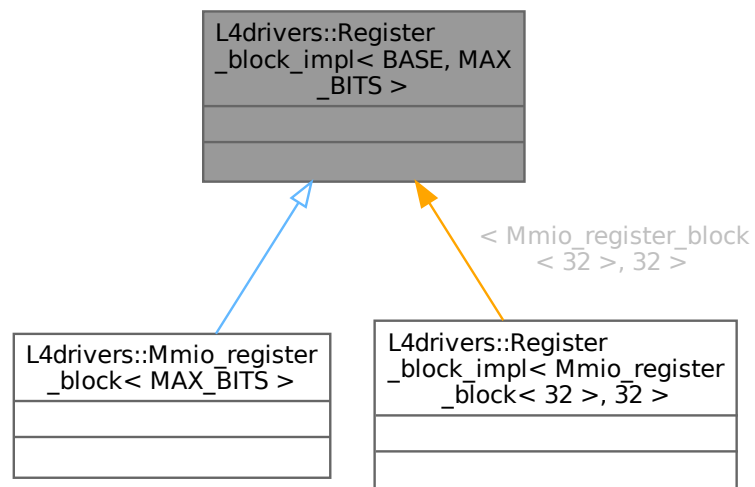

The documentation for this struct was generated from the following file:

- `pkg/drivers-frst/include/hw_register_block`

## 15.268 L4drivers::Register\_block\_impl< BASE, MAX\_BITS > Struct Template Reference

Implementation helper for register blocks.

Inheritance diagram for L4drivers::Register\_block\_impl< BASE, MAX\_BITS >:

Collaboration diagram for L4drivers::Register\_block\_impl< BASE, MAX\_BITS >:

### 15.268.1 Detailed Description

```

template<typename BASE, unsigned MAX_BITS = 32>
struct L4drivers::Register_block_impl< BASE, MAX_BITS >

```

Implementation helper for register blocks.

#### Parameters

<i>BASE</i>	The class implementing read<> and write<> template functions for accessing the registers. This class must inherit from <a href="#">Register_block_impl</a> .
<i>MAX_BITS</i>	The maximum access width for the register file. Supported values are 8, 16, 32, or 64.

This template allows easy implementation of register files by providing read<> and write<> template functions, see [Mmio\\_register\\_block](#) as an example.

Definition at line 454 of file [hw\\_register\\_block](#).

The documentation for this struct was generated from the following file:

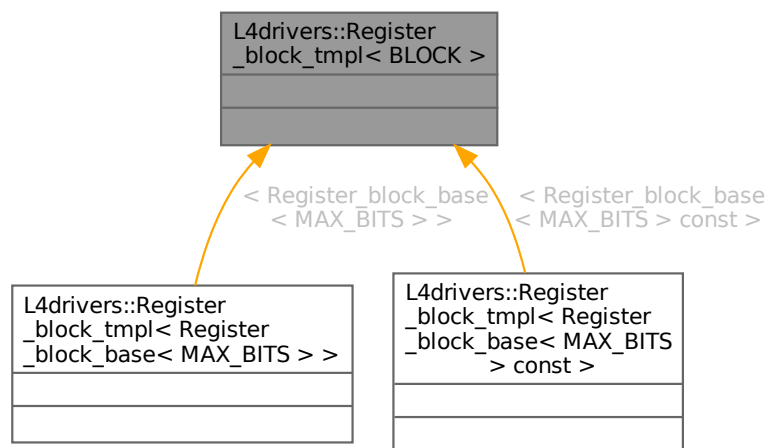

- pkg/drivers-frst/include/hw\_register\_block

## 15.269 L4drivers::Register\_block\_tmpl< BLOCK > Class Template Reference

Helper template that translates to the [Register\\_block\\_base](#) interface.

```
#include <hw_register_block>
```

Inheritance diagram for L4drivers::Register\_block\_tmpl< BLOCK >:

Collaboration diagram for L4drivers::Register\_block\_tmpl< BLOCK >:

### 15.269.1 Detailed Description

```
template<typename BLOCK>
class L4drivers::Register_block_tmpl< BLOCK >
```

Helper template that translates to the [Register\\_block\\_base](#) interface.

#### Template Parameters

<i>BLOCK</i>	The type of the <a href="#">Register_block_base</a> interface to use.
--------------	---

This helper translates `read<T>()`, `write<T>()`, `set<T>()`, `clear<T>()`, and `modify<T>()` calls to `BLOCK::do_read_<xx>` and `BLOCK::do_write_<xx>`.

Definition at line 155 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

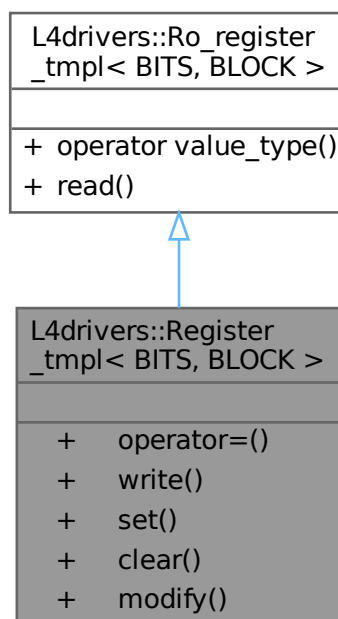

- `pkg/drivers-frst/include/hw_register_block`

## 15.270 L4drivers::Register\_tmpl< BITS, BLOCK > Class Template Reference

Single hardware register inside a [Register\\_block\\_base](#) interface.

```
#include <hw_register_block>
```

Inheritance diagram for `L4drivers::Register_tmpl< BITS, BLOCK >`:

Collaboration diagram for L4drivers::Register\_tmpl< BITS, BLOCK >:

*read the value from the hardware register.*

#### 15.270.1 Detailed Description

```
template<unsigned BITS, typename BLOCK>
class L4drivers::Register_tmpl< BITS, BLOCK >
```

Single hardware register inside a [Register\\_block\\_base](#) interface.

## Template Parameters

<i>BITS</i>	The access width for the register in bits.
<i>BLOCK</i>	the type of the <a href="#">Register_block_base</a> interface.

## Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Definition at line 236 of file [hw\\_register\\_block](#).

## 15.270.2 Member Function Documentation

### 15.270.2.1 clear()

```
template<unsigned BITS, typename BLOCK >
value_type L4drivers::Register\_tmpl< BITS, BLOCK >::clear (
    value_type clear_bits ) [inline]
```

clears bits in *clear\_bits* in the hardware register.

## Parameters

<i>clear_bits</i>	bits to be cleared within the hardware register.
-------------------	--

This is a read-modify-write function that does a logical and of the old value from the register with the negated value of *clear\_bits*.

```
unsigned old_value = read();
write(old_value & ~clear_bits);
```

Definition at line 289 of file [hw\\_register\\_block](#).

### 15.270.2.2 modify()

```
template<unsigned BITS, typename BLOCK >
value_type L4drivers::Register\_tmpl< BITS, BLOCK >::modify (
    value_type clear_bits,
    value_type set_bits ) [inline]
```

clears bits in *clear\_bits* and sets bits in *set\_bits* in the hardware register.

## Parameters

<i>clear_bits</i>	bits to be cleared within the hardware register.
<i>set_bits</i>	bits to set in the hardware register.

This is a read-modify-write function that first does a logical and of the old value from the register with the negated value of *clear\_bits* and then does a logical or with *set\_bits*.

```
unsigned old_value = read();
```

```
write((old_value & ~clear_bits) | set_bits);
```

Definition at line 307 of file [hw\\_register\\_block](#).

### 15.270.2.3 operator=()

```
template<unsigned BITS, typename BLOCK >
Register_tmpl & L4drivers::Register_tmpl< BITS, BLOCK >::operator= (
    value_type val ) [inline]
```

write *val* into the hardware register.

#### Parameters

<i>val</i>	the value to write into the hardware register.
------------	--

Definition at line 251 of file [hw\\_register\\_block](#).

### 15.270.2.4 set()

```
template<unsigned BITS, typename BLOCK >
value_type L4drivers::Register_tmpl< BITS, BLOCK >::set (
    value_type set_bits ) [inline]
```

set bits in *set\_bits* in the hardware register.

#### Parameters

<i>set_bits</i>	bits to be set within the hardware register.
-----------------	--

This is a read-modify-write function that does a logical or of the old value from the register with *set\_bits*.

```
unsigned old_value = read();
write(old_value | set_bits);
```

Definition at line 273 of file [hw\\_register\\_block](#).

### 15.270.2.5 write()

```
template<unsigned BITS, typename BLOCK >
void L4drivers::Register_tmpl< BITS, BLOCK >::write (
    value_type val ) [inline]
```

write *val* into the hardware register.

#### Parameters

<i>val</i>	the value to write into the hardware register.
------------	--

Definition at line 258 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

[Ro\\_register\\_tmpl](#)< BITS, Block > [r](#) (unsigned offset) const  
*Read only access to register at offset offset.*

### 15.271.1 Detailed Description

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> const >>
class L4drivers::Ro_register_block< MAX_BITS, BLOCK >
```

Handles a reference to a read only register block of the given maximum access width.

#### Template Parameters

<i>MAX_BITS</i>	Maximum access width for the registers in this block.
<i>BLOCK</i>	Type implementing the register accesses (read<>()),

Provides read only access to registers in this block via `r<WIDTH>()` and `operator[]()`.

Definition at line 403 of file [hw\\_register\\_block](#).

## 15.271.2 Member Function Documentation

### 15.271.2.1 operator[]()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> const >>
Ro_register L4drivers::Ro_register_block< MAX_BITS, BLOCK >::operator[] (
    unsigned offset ) const [inline]
```

Read only access to register at offset *offset*.

#### Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

#### Returns

register object allowing read only access with width *MAX\_BITS*.

Definition at line 425 of file [hw\\_register\\_block](#).

### 15.271.2.2 r()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> const >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Ro_register_block< MAX_BITS, BLOCK >::r (
    unsigned offset ) const [inline]
```

Read only access to register at offset *offset*.

#### Template Parameters

<i>BITS</i>	the access width in bits for the register.
-------------	--

#### Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

#### Returns

register object allowing read only access with width *BITS*.

Definition at line 435 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

### 15.272.1 Detailed Description

**template<unsigned BITS, typename BLOCK>**  
**class L4drivers::Ro\_register\_tmpl< BITS, BLOCK >**

Single read only register inside a [Register\\_block\\_base](#) interface.

#### Template Parameters

<i>BITS</i>	The access with of the register in bits.
<i>BLOCK</i>	The type for the <a href="#">Register_block_base</a> interface.

#### Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Allows simple read only access to a hardware register.

Definition at line 200 of file [hw\\_register\\_block](#).

### 15.272.2 Member Function Documentation

#### 15.272.2.1 operator value\_type()

```
template<unsigned BITS, typename BLOCK >  
L4drivers::Ro\_register\_tmpl< BITS, BLOCK >::operator value_type ( ) const [inline]
```

read the value from the hardware register.

#### Returns

value read from the hardware register.

Definition at line 216 of file [hw\\_register\\_block](#).

### 15.272.2.2 read()

```
template<unsigned BITS, typename BLOCK >
value_type L4drivers::Ro_register_tmpl< BITS, BLOCK >::read ( ) const [inline]
```

read the value from the hardware register.

#### Returns

value from the hardware register.

Definition at line 223 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

### 15.273.2.3 free()

```
virtual void L4Re::Cap_alloc::free (
    L4::Cap< void > cap,
    l4_cap_idx_t task = L4_INVALID_CAP,
    unsigned unmap_flags = L4_FP_ALL_SPACES ) [pure virtual], [noexcept]
```

Free a capability.

#### Parameters

<i>cap</i>	Capability to free.
<i>task</i>	If set, task to unmap the capability from.
<i>unmap_flags</i>	Flags for unmap, see <code>l4_unmap_flags_t</code> .

#### 15.273.2.4 get\_cap\_alloc()

```
template<typename CAP_ALLOC >
static L4Re::Cap\_alloc * L4Re::Cap_alloc::get_cap_alloc (
    CAP_ALLOC & ca ) [inline], [static]
```

Construct an instance of a capability allocator.

##### Parameters

<i>ca</i>	Capability allocator
-----------	----------------------

##### Returns

Instance of a capability allocator.

Definition at line 90 of file [cap\\_alloc](#).

References [L4\\_FP\\_ALL\\_SPACES](#), and [L4\\_INVALID\\_CAP](#).

### 15.275.1 Detailed Description

Interface for memory-like objects.

Dataspaces are a central abstraction provided by [L4Re](#). A dataspace is an abstraction for any thing that is available via usual memory access instructions. A dataspace can be a file, as well as the memory-mapped registers of a device, or anonymous memory, such as a heap.

The dataspace interface defines a set of methods that allow any kind of dataspace to be attached (mapped) to the virtual address space of an [L4](#) task and then be accessed via memory-access instructions. The [L4Re::Rm](#) interface can be used to attach a dataspace to a virtual address space of a task paged by a certain instance of a region map.

#### Include File

```
#include <l4/re/dataspace>
```

#### Examples

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared\\_](#)

Definition at line 61 of file [dataspace](#).

### 15.275.2 Member Function Documentation

#### 15.275.2.1 allocate()

```
long L4Re::Dataspace::allocate (
    Offset offset,
    Size size )
```

Allocate a range in the dataspace.

#### Parameters

<i>offset</i>	Offset in the dataspace, in bytes.
<i>size</i>	Size of the range, in bytes.

#### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<i>-L4_ENOMEM</i>	Not enough memory available.
<0	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.

The memory is allocated with the same rights as the dataspace capability.

### 15.275.2.2 clear()

```
long L4Re::Dataspace::clear (
    Offset offset,
    Size size )
```

Clear parts of a dataspace.

#### Parameters

<i>offset</i>	Offset within dataspace (in bytes).
<i>size</i>	Size of region to clear (in bytes).

#### Return values

$\geq 0$	Success.
<code>-L4_ERANGE</code>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<code>-L4_EACCESS</code>	No <code>L4_CAP_FPAGE_W</code> right on dataspace capability.
$< 0$	IPC errors

Zeros out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.

### 15.275.2.3 copy\_in()

```
long L4Re::Dataspace::copy_in (
    Offset dst_offs,
    L4::Ipc::Cap< Dataspace > src,
    Offset src_offs,
    Size size )
```

Copy contents from another dataspace.

#### Parameters

<i>dst_offs</i>	Offset in destination dataspace.
<i>src</i>	Source dataspace to copy from.
<i>src_offs</i>	Offset in the source dataspace.
<i>size</i>	Size to copy (in bytes).

#### Return values

<code>L4_EOK</code>	Success
---------------------	---------

## Return values

<code>-L4_EACCESS</code>	No <a href="#">L4_CAP_FPAGE_W</a> right on the destination dataspace.
<code>-L4_EINVAL</code>	Invalid parameter supplied.
<code>&lt;0</code>	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspaces are not from the same dataspace manager or the dataspace managers do not cooperate.

**15.275.2.4 flags()**

```
Dataspace::Flags L4Re::Dataspace::flags ( ) const [noexcept]
```

Get flags of the dataspace.

## Return values

<code>&gt;=0</code>	Flags of the dataspace
<code>&lt;0</code>	IPC errors

## See also

[L4Re::Dataspace::F::Flags](#)

Definition at line 122 of file [dataspace\\_impl.h](#).

References [L4Re::Dataspace::Stats::flags](#), and [info\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.275.2.5 info()

```
long L4Re::Dataspace::info (
    Stats * stats )
```

Get information on the dataspace.

#### Parameters

out	stats	Dataspace information
-----	-------	-----------------------

#### Return values

0	Success
<0	IPC errors

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< DATA >::Driver\\_mem\\_region\\_t\(\)](#), [flags\(\)](#), and [size\(\)](#).

Here is the caller graph for this function:

### 15.275.2.6 map()

```
long L4Re::Dataspace::map (
    Dataspace::Offset offset,
    Dataspace::Flags flags,
    Dataspace::Map_addr local_addr,
    Dataspace::Map_addr min_addr,
    Dataspace::Map_addr max_addr,
    L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid ) const [noexcept]
```

Request a flex-page mapping from the dataspace.

#### Parameters

<i>offset</i>	Offset to start within dataspace
<i>flags</i>	<a href="#">Dataspace</a> flags, see <a href="#">L4Re::Dataspace::F::Flags</a> .
<i>local_addr</i>	Local address to map to.
<i>min_addr</i>	Defines start of receive window. (Rounded down to page size.)
<i>max_addr</i>	Defines end of receive window. (Rounded up to page size.)
<i>dst</i>	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

#### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Invalid offset.
<i>-L4_EPERM</i>	Insufficient permission to map with requested rights.
<i>&lt;0</i>	IPC errors

The map call will attempt to map the largest possible flexpage that covers the given local address and still fits into the region defined by *min\_addr* and *max\_addr*. If the given region is invalid or does not overlap the local address, the smallest valid page size is used.

Definition at line 96 of file [dataspace\\_impl.h](#).

References [L4\\_LOG2\\_PAGESIZE](#).

### 15.275.2.7 map\_info()

```
long L4Re::Dataspace::map_info (
    l4_addr_t * ,
    l4_addr_t * ) [inline]
```

Get mapping range of dataspace.

In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.

On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

## Parameters

out	<i>start_addr</i>	Start address of dataspace.
out	<i>end_addr</i>	End address (inclusive) of dataspace.

## Return values

$>0$	Start/end address have been set and need to be obeyed.
$0$	No constraint of mapping address.
$-L4\_EPMR$	Cannot infer mapping address. <a href="#">Dataspace</a> not mappable.
$<0$	IPC errors.

Definition at line 315 of file [dataspace](#).

## 15.275.2.8 map\_region()

```
long L4Re::Dataspace::map_region (
    Dataspace::Offset offset,
    Dataspace::Flags flags,
    Dataspace::Map_addr min_addr,
    Dataspace::Map_addr max_addr,
    L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid ) const [noexcept]
```

Map a part of a dataspace into a local memory area.

## Parameters

<i>offset</i>	Offset to start within dataspace.
<i>flags</i>	<a href="#">Dataspace</a> flags, see <a href="#">L4Re::Dataspace::F::Flags</a> .
<i>min_addr</i>	(Inclusive) start of the receive area.
<i>max_addr</i>	(Exclusive) end of receive area.
<i>dst</i>	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

## Return values

<i>L4_EOK</i>	Success
$-L4\_ERANGE$	Invalid offset or receive area larger than the dataspace.
$-L4\_EPMR$	Insufficient permission to map with requested rights.
$<0$	IPC errors

This is a convenience function which maps flex-pages consecutively into the given memory area in the local task. The area is expected to be filled completely. If the dataspace is not large enough to provide the mappings for the entire size of the area, then an error is returned. Mappings may or may not have been already established at that point.

*offset* and *min\_addr* are rounded down to the next `L4_PAGESIZE` boundary when necessary. *max\_addr* is rounded up to the page boundary. If the resulting maximum address is less or equal than the minimum address, then the function is a noop.

Definition at line 56 of file [dataspace\\_impl.h](#).

References [L4\\_LOG2\\_PAGESIZE](#), [L4\\_UNLIKELY](#), [L4::round\\_order\(\)](#), and [L4::trunc\\_order\(\)](#).

Here is the call graph for this function:

#### 15.275.2.9 size()

```
Dataspace::Size L4Re::Dataspace::size ( ) const [noexcept]
```

Get size of a dataspace.

##### Returns

Size of the dataspace in bytes.

Definition at line 112 of file [dataspace\\_impl.h](#).

References [info\(\)](#), and [L4Re::Dataspace::Stats::size](#).

Here is the call graph for this function:

## 15.280.1 Detailed Description

Managed DMA Address Space.

A managed [Dma\\_space](#) represents the [L4Re](#) abstraction of an DMA address space of one or several devices. Devices are assigned to a managed [Dma\\_space](#) by binding the [Dma\\_space](#) to the respective DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)), which might link the [Dma\\_space](#) with a kernel [DMA space](#). Note that several DMA domains can be bound to the same [Dma\\_space](#). Whenever a device needs direct access to parts of an [L4Re::Dataspace](#), that part of the data space must be mapped to the managed [Dma\\_space](#) that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.

Mapping to a managed DMA address space, using `map()`, makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping. Additionally, `map()` is responsible for the necessary syncing operations before the DMA.

`unmap()` is the reverse operation to `map()` and unmaps the given data-space part for the DMA address space. `unmap()` is responsible for the necessary sync operations after the DMA.

Definition at line 63 of file [dma\\_space](#).

## 15.280.2 Member Typedef Documentation

### 15.280.2.1 Attributes

```
typedef L4::Types::Flags<Attribute> L4Re::Dma_space::Attributes
```

Attributes for DMA mappings.

See also

[Attribute](#)

Definition at line 108 of file [dma\\_space](#).

## 15.280.3 Member Enumeration Documentation

### 15.280.3.1 Attribute

```
enum L4Re::Dma_space::Attribute
```

Attributes used for the memory region during the transfer.

See also

[Attributes](#)

## Enumerator

No_sync	Do not sync the memory hierarchy. When this flag is <i>not set</i> (default) the memory region shall be made coherent to the point-of-coherency of the device associated with this <a href="#">Dma_space</a> . When using this attribute the client is responsible for syncing the memory hierarchy for DMA. This can either be done using the cache API or by another <code>map()</code> or <code>unmap()</code> operation of the same part of the data space (without the <a href="#">No_sync</a> attribute).
---------	---

Definition at line 87 of file [dma\\_space](#).

## 15.280.3.2 Direction

```
enum L4Re::Dma_space::Direction
```

Direction of the DMA transfers.

## Enumerator

Bidirectional	device reads and writes to the memory
To_device	device reads the memory
From_device	device writes to the memory
None	device is coherently connected to the memory

Definition at line 75 of file [dma\\_space](#).

## 15.280.3.3 Space\_attrib

```
enum L4Re::Dma_space::Space_attrib
```

Attributes assigned to the DMA space when associated with a specific device.

## See also

[Space\\_attribs](#)

## Enumerator

Coherent	The device is connected coherently with the cache. This means that the <code>map()</code> and <code>unmap()</code> do not need to sync CPU caches before and after DMA.
Phys_space	The DMA space has no DMA task assigned and uses the CPUs physical memory.

Definition at line 115 of file [dma\\_space](#).

## 15.280.4 Member Function Documentation

## 15.280.4.1 associate()

```
long L4Re::Dma_space::associate (
```

```

L4::Ipc::Opt< L4::Ipc::Cap< L4::Task > > dma_task,
Space_attribs attr )

```

Associate a (kernel) [DMA space](#) for a device to this [Dma\\_space](#).

#### Parameters

in	<i>dma_task</i>	The (kernel) <a href="#">DMA space</a> used for the device that shall be associated with this DMA space. In case no IOMMU is present or configured, the <i>dma_task</i> might be an invalid capability when <a href="#">L4Re::Dma_space::Phys_space</a> is set in <i>attr</i> , in this case the CPUs physical memory is used as DMA address space.
in	<i>attr</i>	Attributes for this DMA space. See <a href="#">L4Re::Dma_space::Space_attrib</a> .

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the <a href="#">Dma_space</a> capability.
<i>-L4_EINVAL</i>	
<i>-L4_ENOENT</i>	

#### Precondition

requires capability rights: {RW}

### 15.280.4.2 disassociate()

```
long L4Re::Dma_space::disassociate ( )
```

Disassociate the (kernel) [DMA space](#) from this [Dma\\_space](#).

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the <a href="#">Dma_space</a> capability.
<i>-L4_ENOENT</i>	

#### Precondition

requires capability rights: {RW}

### 15.280.4.3 map()

```

long L4Re::Dma_space::map (
    L4::Ipc::Cap< L4Re::Dataspace > src,
    L4Re::Dataspace::Offset offset,
    L4::Ipc::In_out< l4_size_t * > size,
    Attributes attrs,

```

```
Direction dir,  
Dma_addr * dma_addr )
```

Map the given part of this data space into the DMA address space.

## Parameters

in	<i>src</i>	Source data space (that describes the memory). Caller needs write right to the data space.
in	<i>offset</i>	The offset (bytes) within <i>src</i> .
in, out	<i>size</i>	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call <code>map()</code> again with a new offset and the remaining size.
in	<i>attrs</i>	The attributes used for this DMA mapping (a combination of <a href="#">Dma_space::Attribute</a> values).
in	<i>dir</i>	The direction of the DMA transfer issued with this mapping. The same value must later be passed to <a href="#">unmap()</a> .
out	<i>dma_addr</i>	The DMA address to use for DMA with the associated device.

## Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on <i>src</i> capability.
<i>-L4_EINVAL</i>	The <i>src</i> capability is invalid or does not refer to a valid dataspace.
<i>-L4_EEXIST</i>	The specified region overlaps an existing mapping.
<i>-L4_ENOMEM</i>	Not enough memory to allocate internal datastructures.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.

## Precondition

requires capability rights: {R}

## Note

[associate\(\)](#) must be called prior to mapping memory. Usually this is done implicitly when binding the managed [Dma\\_space](#) to a DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)).

## 15.280.4.4 unmap()

```
long L4Re::Dma_space::unmap (
    Dma_addr dma_addr,
    l4_size_t size,
    Attributes attrs,
    Direction dir )
```

Unmap the given part of this data space from the DMA address space.

## Parameters

<i>dma_addr</i>	The DMA address (returned by <a href="#">Dma_space::map()</a> ).
<i>size</i>	The size (bytes) of the memory region to unmap.
<i>attrs</i>	The attributes for the unmap (currently none).
<i>dir</i>	The direction of the finished DMA operation.

**Returns**

0 in the case of success, a negative error code otherwise.

**Precondition**

requires capability rights: {R}

The documentation for this class was generated from the following file:

- [l4/re/dma\\_space](#)

## 15.281 L4Re::Env Class Reference

*Returns the initial environment for the current task.*

### 15.281.1 Detailed Description

C++ interface of the initial environment that is provided to an [L4](#) task.

The initial environment is provided to each [L4](#) task that is started by an [L4Re](#) conform loader, such as the Moe root task. The initial environment provides access to a set of initial capabilities and some additional information about the available resources, such as free UTCBs (see [Virtual Registers](#) ) and available entries in capability table (provided by the micro kernel).

Each of the initial capabilities is stored at a fixed index in the task's capability table and the [L4](#) runtime environment provides convenience functions to retrieve the capabilities. See the table below for an comprehensive overview.

Name	Object Type	Convenience Function
parent	<a href="#">L4Re::Parent</a>	<a href="#">L4Re::Env::parent()</a>
user_factory	<a href="#">L4::Factory</a>	<a href="#">L4Re::Env::user_factory()</a>
log	<a href="#">L4Re::Log</a>	<a href="#">L4Re::Env::log()</a>
main_thread	<a href="#">L4::Thread</a>	<a href="#">L4Re::Env::main_thread()</a>
rm	<a href="#">L4Re::Rm</a>	<a href="#">L4Re::Env::rm()</a>
factory	<a href="#">L4::Factory</a>	<a href="#">L4Re::Env::factory()</a>
task	<a href="#">L4::Task</a>	<a href="#">L4Re::Env::task()</a>
scheduler	<a href="#">L4::Scheduler</a>	<a href="#">L4Re::Env::scheduler()</a>

Additional information found in the initial environment is:

- First free entry in capability table
- The [UTCB](#) area (as flex page)
- First free UTCB (address in the UTCB area)

## Include File

```
#include <l4/re/env>
```

For an explanation of the default task capabilities see [l4\\_default\\_caps\\_t](#).

For the C interface refer to [Initial Environment](#).

Definition at line 85 of file [env](#).

## 15.281.2 Member Function Documentation

### 15.281.2.1 env()

```
static Env const * L4Re::Env::env ( ) [inline], [static], [noexcept]
```

Returns the initial environment for the current task.

#### Returns

Pointer to the initial environment class.

A typical use of this function is `L4Re::Env::env()-><member>()`

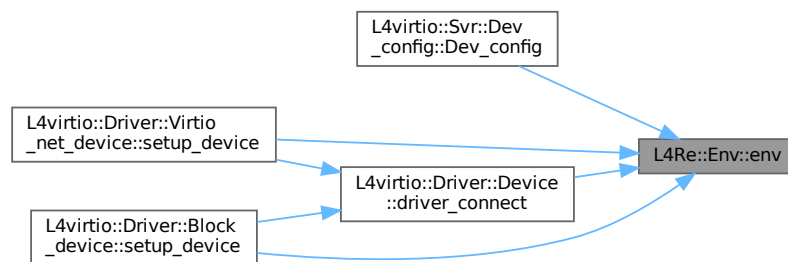

#### Examples

`examples/clntsrv/client.cc`, `examples/libs/l4re/c++/mem_alloc/ma+rm.cc`, `examples/libs/l4re/c++/shared_ds/ds_clnt.cc`, `examples/libs/l4re/c++/shared_ds/ds_srv.cc`, `examples/libs/l4re/streammap/client.cc`, and `examples/sys/migrate/thread_migrate`

Definition at line 103 of file `env`.

Referenced by `L4virtio::Svr::Dev_config::Dev_config()`, `L4virtio::Driver::Device::driver_connect()`, `L4virtio::Driver::Virtio_net_device::setup_device()` and `L4virtio::Driver::Block_device::setup_device()`.

Here is the caller graph for this function:

### 15.281.2.2 factory() [1/2]

```
L4::Cap< L4::Factory > L4Re::Env::factory ( ) const [inline], [noexcept]
```

Object-capability to the factory object available to the task.

#### Returns

Factory object-capability

Definition at line 151 of file `env`.

References `l4re_env_t::factory`.

### 15.281.2.3 factory() [2/2]

```
void L4Re::Env::factory (
    L4::Cap< L4::Factory > const & c ) [inline], [noexcept]
```

Set factory object-capability.

## Parameters

<code>c</code>	Factory object-capability
----------------	---------------------------

Definition at line 256 of file [env](#).

References [l4re\\_env\\_t::factory](#).

**15.281.2.4 first\_free\_cap()** [1/2]

```
l4_cap_idx_t L4Re::Env::first_free_cap ( ) const [inline], [noexcept]
```

First available capability selector.

## Returns

First capability selector.

First capability selector available for use for in the application.

Definition at line 159 of file [env](#).

References [l4re\\_env\\_t::first\\_free\\_cap](#).

**15.281.2.5 first\_free\_cap()** [2/2]

```
void L4Re::Env::first_free_cap (
    l4_cap_idx_t c ) [inline], [noexcept]
```

Set first available capability selector.

## Parameters

<code>c</code>	First capability selector available to the application.
----------------	---

Definition at line 262 of file [env](#).

References [l4re\\_env\\_t::first\\_free\\_cap](#).

**15.281.2.6 first\_free\_utcb()** [1/2]

```
l4_addr_t L4Re::Env::first_free_utcb ( ) const [inline], [noexcept]
```

First free UTCB.

## Returns

object-capability

First free UTCB within the UTCB area available for the application to use.

Definition at line 174 of file [env](#).

References [l4re\\_env\\_t::first\\_free\\_utcb](#).

**15.281.2.7 first\_free\_utcb()** [2/2]

```
void L4Re::Env::first_free_utcb (
    l4_addr_t u ) [inline], [noexcept]
```

Set first free UTCB.

**Parameters**

<i>u</i>	First UTCB available for the application to use.
----------	--

Definition at line 274 of file [env](#).

References [l4re\\_env\\_t::first\\_free\\_utcb](#).

**15.281.2.8 get()**

```
Cap_entry const * L4Re::Env::get (
    char const * name,
    unsigned l ) const [inline], [noexcept]
```

Get the Cap\_entry for the object named *name*.

**Parameters**

<i>name</i>	is the name of the object.
<i>l</i>	is the length of the name, thus <i>name</i> might not be zero terminated.

**Returns**

A pointer to the Cap\_entry for the object named *name*, or NULL if no such object was found.

Definition at line 192 of file [env](#).

References [l4re\\_env\\_get\\_cap\\_l\(\)](#).

Here is the call graph for this function:

### 15.281.2.9 get\_cap() [1/2]

```
template<typename T >  
L4::Cap< T > L4Re::Env::get_cap (   
    char const * name ) const [inline], [noexcept]
```

Get the capability selector for the object named *name*.

## Parameters

<i>name</i>	is the name of the object (zero terminated).
-------------	--

## Returns

A capability selector for the object named *name*, or an invalid capability selector if no such object was found.

Definition at line 219 of file [env](#).

**15.281.2.10 get\_cap()** [2/2]

```
template<typename T >
L4::Cap< T > L4Re::Env::get_cap (
    char const * name,
    unsigned l ) const [inline], [noexcept]
```

Get the capability selector for the object named *name*.

## Parameters

<i>name</i>	is the name of the object.
<i>l</i>	is the length of the name, thus <i>name</i> might not be zero terminated.

## Returns

A capability selector for the object named *name*, or an invalid capability selector if no such object was found.

## Examples

[examples/clntsrv/client.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/streammap/client.cc](#).

Definition at line 204 of file [env](#).

References [L4\\_ENOENT](#).

**15.281.2.11 initial\_caps()** [1/2]

```
Cap_entry const * L4Re::Env::initial_caps ( ) const [inline], [noexcept]
```

Get a pointer to the first entry in the initial objects array.

## Returns

A pointer to the first entry in the initial objects array.

Definition at line 181 of file [env](#).

References [l4re\\_env\\_t::caps](#).

**15.281.2.12 initial\_caps()** [2/2]

```
void L4Re::Env::initial_caps (
    Cap_entry * first ) [inline], [noexcept]
```

Set the pointer to the first *Cap\_entry* in the initial objects array.

## Parameters

<i>first</i>	is the first element in the array.
--------------	------------------------------------

Definition at line 296 of file [env](#).

References [l4re\\_env\\_t::caps](#).

**15.281.2.13 log()** [1/2]

```
L4::Cap< Log > L4Re::Env::log ( ) const [inline], [noexcept]
```

Object-capability to the logging service.

## Returns

[Log](#) object-capability

Definition at line 133 of file [env](#).

References [l4re\\_env\\_t::log](#).

**15.281.2.14 log()** [2/2]

```
void L4Re::Env::log (
    L4::Cap< Log > const & c ) [inline], [noexcept]
```

Set log object-capability.

## Parameters

<i>c</i>	<a href="#">Log</a> object-capability
----------	---------------------------------------

Definition at line 244 of file [env](#).

References [l4re\\_env\\_t::log](#).

**15.281.2.15 main\_thread()** [1/2]

```
L4::Cap< L4::Thread > L4Re::Env::main_thread ( ) const [inline], [noexcept]
```

Object-capability of the first user thread.

## Returns

Object-capability of the first user thread.

Definition at line 139 of file [env](#).

References [l4re\\_env\\_t::main\\_thread](#).

**15.281.2.16 main\_thread()** [2/2]

```
void L4Re::Env::main_thread (
    L4::Cap< L4::Thread > const & c ) [inline], [noexcept]
```

Set object-capability of first user thread.

**Parameters**

<b>c</b>	First thread's object-capability
----------	----------------------------------

Definition at line 250 of file [env](#).

References [l4re\\_env\\_t::main\\_thread](#).

**15.281.2.17 mem\_alloc()** [1/2]

```
L4::Cap< Mem_alloc > L4Re::Env::mem_alloc ( ) const [inline], [noexcept]
```

Object-capability to the memory allocator.

**Returns**

Memory allocator object-capability

**Examples**

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#).

Definition at line 116 of file [env](#).

References [l4re\\_env\\_t::mem\\_alloc](#).

**15.281.2.18 mem\_alloc()** [2/2]

```
void L4Re::Env::mem_alloc (
    L4::Cap< Mem_alloc > const & c ) [inline], [noexcept]
```

Set memory allocator object-capability.

**Parameters**

<b>c</b>	Memory allocator object-capability
----------	------------------------------------

Definition at line 232 of file [env](#).

References [l4re\\_env\\_t::mem\\_alloc](#).

**15.281.2.19 parent()** [1/2]

```
L4::Cap< Parent > L4Re::Env::parent ( ) const [inline], [noexcept]
```

Object-capability to the parent.

**Returns**

[Parent](#) object-capability

Definition at line 110 of file [env](#).

References [l4re\\_env\\_t::parent](#).

**15.281.2.20 parent()** [2/2]

```
void L4Re::Env::parent (
    L4::Cap< Parent > const & c ) [inline], [noexcept]
```

Set parent object-capability.

**Parameters**

c	<a href="#">Parent</a> object-capability
---	--

Definition at line 226 of file [env](#).

References [l4re\\_env\\_t::parent](#).

**15.281.2.21 rm()** [1/2]

```
L4::Cap< Rm > L4Re::Env::rm ( ) const [inline], [noexcept]
```

Object-capability to the region map.

**Returns**

Region map object-capability

**Examples**

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#).

Definition at line 127 of file [env](#).

References [l4re\\_env\\_t::rm](#).

**15.281.2.22 rm()** [2/2]

```
void L4Re::Env::rm (
    L4::Cap< Rm > const & c ) [inline], [noexcept]
```

Set region map object-capability.

**Parameters**

<code>c</code>	Region map object-capability
----------------	------------------------------

Definition at line 238 of file [env](#).

References [l4re\\_env\\_t::rm](#).

**15.281.2.23 scheduler()** [1/2]

```
L4::Cap< L4::Scheduler > L4Re::Env::scheduler ( ) const [inline], [noexcept]
```

Get the scheduler capability for the task.

**Returns**

The capability selector for the default scheduler used for this task.

**Examples**

[examples/sys/migrate/thread\\_migrate.cc](#).

Definition at line 282 of file [env](#).

References [l4re\\_env\\_t::scheduler](#).

**15.281.2.24 scheduler()** [2/2]

```
void L4Re::Env::scheduler (
    L4::Cap< L4::Scheduler > const & c ) [inline], [noexcept]
```

Set the scheduler capability.

**Parameters**

<code>c</code>	is the capability to be set as scheduler.
----------------	---

Definition at line 289 of file [env](#).

References [l4re\\_env\\_t::scheduler](#).

**15.281.2.25 task()**

```
L4::Cap< L4::Task > L4Re::Env::task ( ) const [inline], [noexcept]
```

Object-capability of the user task.

**Returns**

Object-capability of the user task.

Definition at line 145 of file [env](#).

**15.281.2.26 utcb\_area()** [1/2]

```
l4_fpage_t L4Re::Env::utcb_area ( ) const [inline], [noexcept]
```

UTCB area of the task.

**Returns**

UTCB area

Definition at line 165 of file [env](#).

References [l4re\\_env\\_t::utcb\\_area](#).

**15.281.2.27 utcb\_area()** [2/2]

```
void L4Re::Env::utcb_area (
    l4_fpage_t utcbs ) [inline], [noexcept]
```

Set UTCB area of the task.

**Parameters**

<i>utcbs</i>	UTCB area
--------------	-----------

Definition at line 268 of file [env](#).

References [l4re\\_env\\_t::utcb\\_area](#).

## 15.282.1 Detailed Description

[Event](#) class.

See also

[L4Re Event API](#)

Definition at line 148 of file [event](#).

## 15.282.2 Member Function Documentation

### 15.282.2.1 [get\\_axis\\_info\(\)](#)

```
long L4Re::Event::get_axis_info (
    l4_umword_t stream_id,
    unsigned naxes,
    unsigned const * axis,
    Event_absinfo * info ) const [inline], [noexcept]
```

Get event stream axis infos.

**Parameters**

	<i>stream↔ _id</i>	ID of the event stream.
in	<i>axes</i>	Array of axis IDs.
out	<i>info</i>	Array of axis infos.

**Return values**

$\geq 0$	Number of returned axes infos.
$< 0$	Error code.

Definition at line 208 of file [event](#).

**15.282.2.2 get\_buffer()**

```
long L4Re::Event::get_buffer (
    L4::Ipc::Out< L4::Cap< Dataspace > > ds )
```

Get event signal buffer.

**Parameters**

out	<i>ds</i>	<a href="#">Event</a> buffer.
-----	-----------	-------------------------------

**Return values**

0	Success
$< 0$	Error

**15.282.2.3 get\_num\_streams()**

```
long L4Re::Event::get_num_streams ( )
```

Get number of event streams.

**Return values**

$\geq 0$	Number of streams.
$< 0$	Error code.

**15.282.2.4 get\_stream\_info()**

```
long L4Re::Event::get_stream_info (
    int idx,
    Event_stream_info * info )
```

Get event stream infos.

Deprecated. Use [get\\_stream\\_info\\_for\\_id\(\)](#).

#### Parameters

	<i>idx</i>	ID of the event stream.
out	<i>info</i>	<a href="#">Event</a> stream info.

#### Return values

0	Success
<0	Error

### 15.282.2.5 [get\\_stream\\_info\\_for\\_id\(\)](#)

```
long L4Re::Event::get_stream_info_for_id (
    l4_umword_t stream_id,
    Event_stream_info * info )
```

Get event stream infos.

#### Parameters

	<i>stream↔ _id</i>	ID of the event stream.
out	<i>info</i>	<a href="#">Event</a> stream info.

#### Return values

0	Success
<0	Error

### 15.282.2.6 [get\\_stream\\_state\\_for\\_id\(\)](#)

```
long L4Re::Event::get_stream_state_for_id (
    l4_umword_t stream_id,
    Event_stream_state * state )
```

Get event stream state.

#### Parameters

	<i>stream↔ _id</i>	ID of the event stream.
out	<i>state</i>	<a href="#">Event</a> stream state.

## Return values

0	Success
<0	Error
