```

C interface for calling the ARM secure monitor, see [L4::Arm\\_smccc::call\(\)](#) for the C++ interface.

#### Parameters

<i>pfc</i>	Capability of the SMC kernel object.
------------	--------------------------------------

The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.

## Parameters

	<i>func</i>	Function identifier. <ul style="list-style-type: none"> <li>• Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel.</li> <li>• Bit 30 defines the calling convention:</li> <li>• Bit 30 == 1: 64-bit calling convention.</li> <li>• Bit 30 == 0: 32-bit calling convention.</li> <li>• Bits 24..29 determine the service call ID. Only service IDs <math>\geq 0x30000000</math> (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed.</li> </ul>
in	<i>in0</i>	First input parameter.
in	<i>in1</i>	Second input parameter.
in	<i>in2</i>	Third input parameter.
in	<i>in3</i>	Fourth input parameter.
in	<i>in4</i>	Fifth input parameter.
in	<i>in5</i>	Sixth input parameter.
out	<i>out0</i>	First output parameter.
out	<i>out1</i>	Second output parameter.
out	<i>out2</i>	Third output parameter.
out	<i>out3</i>	Fourth output parameter.
in	<i>client_id</i>	Client ID. According to the specification, this value might be ignored by certain functions.

## Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID $< 0x30000000$ .
-L4_EINVAL	Invalid number of parameters.
$< 0$	Other L4 error.
0	Success.

```

#### Value:

```
public:
    _class(_class const &) = delete; \
    _class operator = (_class const &) = delete; \
private:
```

Disable copy of a class.

#### Parameters

<code>_class</code>	Name of the class that shall not have value copy semantics.

### 16.459.1.1 L4\_RPC\_DEF

```
#define L4_RPC_DEF(  
    name )
```

#### Value:

```
template struct L4::Ipc::Msg::Rpc_call \  
    <name##_t, name##_t::class_type, name##_t::ipc_type, name##_t::flags_type>
```

Generate the definition of an RPC stub.

## Parameters

<i>name</i>	The fully qualified method name to be implemented, this means <code>class::method</code> .
-------------	--

This macro generates the definition (implementation) for the given RPC interface method.

## 16.462.2 Macro Definition Documentation

### 16.462.2.1 L4\_INLINE\_RPC

```
#define L4_INLINE_RPC(  
    res,  
    name,  
    args,  
    attr... ) res name args
```

Define an inline RPC call (type and callable).

## Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function ( <i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function.
<i>attr</i>	Optional RPC attributes ( <a href="#">L4::ipc::Call</a> , <a href="#">L4::ipc::Call_t</a> etc.).

Definition at line 469 of file [ipc\\_iface](#).

## 16.462.2.2 L4\_INLINE\_RPC\_NF

```
#define L4_INLINE_RPC_NF(
    res,
    name,
    args... )
```

## Value:

```
struct name##_t : L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> \
{ \
    typedef L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> type; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}
```

Define an inline RPC call type (the type only, no callable).

## Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function ( <i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function, and RPC attributes ( <a href="#">L4::ipc::Call</a> , <a href="#">L4::ipc::Call_t</a> etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

Definition at line 440 of file [ipc\\_iface](#).

## 16.462.2.3 L4\_INLINE\_RPC\_NF\_OP

```
#define L4_INLINE_RPC_NF_OP(
    op,
    res,
    name,
    args... )
```

## Value:

```
struct name##_t : L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> \
{ \
    typedef L4::Ip::Msg::Rpc_inline_call<name##_t, Class, res args> type; \
    enum { Opcode = (op) }; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}
```

Define an inline RPC call type with specific opcode (the type only, no callable).

## Parameters

<i>op</i>	The opcode number for this function
<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function ( <i>name_t</i> is used for the type.)
<i>args</i>	The argument list of the RPC function, and RPC attributes ( <a href="#">L4::lpc::Call</a> , <a href="#">L4::lpc::Call_t</a> etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

### 16.473.1.1 L4\_TYPES\_FLAGS\_OPS\_DEF

```
#define L4_TYPES_FLAGS_OPS_DEF(  
    T )
```

#### Value:

```
friend constexpr T operator ~ (T f)
{
    return T(~static_cast<typename L4::Types::Int_for_type<T>::type>(f));
}

friend constexpr T operator | (T l, T r)
{
    return T(static_cast<typename L4::Types::Int_for_type<T>::type>(l)
        | static_cast<typename L4::Types::Int_for_type<T>::type>(r));
}

friend constexpr T operator & (T l, T r)
{
    return T(static_cast<typename L4::Types::Int_for_type<T>::type>(l)
        & static_cast<typename L4::Types::Int_for_type<T>::type>(r));
}
```

Helper macro to define a set of bitwise operators on an enum type.

This allows to use the enum type as bitmask type with '&', '|', and '~' operators that keep the enum type as result.

### 16.501.1 Detailed Description

The C IPC gate interface, see [L4::ipc\\_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) that is *bound* to the IPC gate (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When no thread is bound yet, the forwarded IPC blocks until a thread is bound or the IPC times out.

Forwarded IPC is always forwarded to the userland of the bound thread. That means, the [Thread](#) interface of the bound thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the bound thread instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding a thread to an IPC gate, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are the result of bitwise disjunction of the corresponding label bits with the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. Hence, the label provided via [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) should usually have its two least significant bits set to zero. The replaced label is only visible to the bound thread upon receive. However, the configured label of an IPC gate can also be queried via [l4\\_ipc\\_gate\\_get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4\\_thread\\_modify\\_sender\\_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread for the first time.

When binding a new thread to an IPC gate that is currently bound, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

```
#define l4_kip_for_each_feature(  
    s )    for (s += __builtin_strlen(s) + 1; *s; s += __builtin_strlen(s) + 1)
```

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. *s* must be a character pointer (`char const *`) initialized with [l4\\_kip\\_version\\_string\(\)](#).

### 16.521.3 Function Documentation

#### 16.521.3.1 l4\_kip\_kernel\_has\_feature()

```
int l4_kip_kernel_has_feature (  
    l4\_kernel\_info\_t const * kip,  
    char const * str ) [inline]
```

Check if kernel supports a feature.

## Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
<i>str</i>	Feature name to check.

## Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

### 16.569.2.1 \_\_L4UTIL\_THREAD\_FUNC

```
#define __L4UTIL_THREAD_FUNC(  
    name ) void L4_NORETURN name(void)
```

Defines a wrapper function that sets up the registers according to the calling conventions for the architecture.

Use this as a function header when starting a low-level thread where only stack and instruction pointer are in a well-defined state.

Example:

```
L4UTIL_THREAD_FUNC(helper_thread) { l4_infinite_loop(); }
```

```
thread_cap->ex_regs((l4_umword_t)helper_thread, stack_addr);
```

### 16.585.2 Function Documentation

#### 16.585.2.1 l4\_vcpu\_check\_version()

```
int l4_vcpu_check_version (
    l4_vcpu_state_t const * vcpu ) [inline]
```

Check if a vCPU state has the right version.

#### Parameters

<code>vcpu</code>	A pointer to an initialized vCPU state.
-------------------	---

#### Return values

1	If the vCPU state has a matching version ID for the current vCPU user-level structures.
0	If the vCPU state has a different (incompatible) version ID than the current vCPU user-level structures.

### 16.627.1 Detailed Description

Description of the vbus C API.

Definition in file [vbus.h](#).

### 16.627.2 Enumeration Type Documentation

#### 16.627.2.1 anonymous enum

`anonymous enum`

Constants for device nodes.

Enumerator

L4VBUS_NULL	NULL device.
L4VBUS_ROOT_BUS	Root device on the vbus.

Definition at line 22 of file [vbus.h](#).

### 16.627.2.2 l4vbus\_icu\_src\_types

enum `l4vbus_icu_src_types`

Flags that can be used with the ICU on a vbus device.

#### Enumerator

L4VBUS_ICU_SRC_DEV_HANDLE	Flag to denote that the value should be interpreted as a device handle. This flag may be used in the <code>source</code> parameter in <code>l4_icu_msi_info()</code> to denote that the ICU should interpret the source ID as a device handle.

### 16.635.1 Detailed Description

This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.

Definition in file [vbus\\_interfaces.h](#).

### 16.635.2 Typedef Documentation

#### 16.635.2.1 l4vbus\_iface\_type\_t

```
typedef enum l4vbus_iface_type_t l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.

The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.

The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS\_IFACE\_SHIFT). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

### 16.635.3 Enumeration Type Documentation

#### 16.635.3.1 anonymous enum

```
anonymous enum
```

##### Enumerator

L4VBUS_IFACE_SHIFT	Sub-interface ID shift. Divides the function opcode sent via IPC into a sub-interface ID and the actual function opcode within the sub-interface.
--------------------	---

Definition at line 50 of file [vbus\\_interfaces.h](#).

#### 16.635.3.2 l4vbus\_iface\_type\_t

```
enum l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.

The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.

The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS\_IFACE\_SHIFT). L4VBUS_INTERFACE_PCI	PCI.
L4VBUS_INTERFACE_PCIDEV	PCI Device.

L4VBUS_INTERFACE_GENERIC	No specific sub interface.

Definition at line 31 of file [vbus\\_interfaces.h](#).

## 16.635.4 Function Documentation

### 16.635.4.1 l4vbus\_subinterface\_supported()

```
int l4vbus_subinterface_supported (
    l4_uint32_t dev_type,
    l4vbus_iface_type_t iface_type ) [inline]
```

Check if a vbus device supports a given sub-interface.

#### Parameters

<i>dev_type</i>	Device type as reported in <a href="#">l4vbus_device_t</a> .
<i>iface_type</i>	Sub-interface type to check for.

#### Returns

True if the device supports the sub-interface.
